

FEATURES

- Bidirectional I²C communication**
- Open-drain interfaces**
- Suitable for hot swap applications**
- 30 mA current sink capability**
- 1000 kHz operation**
- 3.0 V to 5.5 V supply/logic levels**
- 16-lead SOIC wide body package version (RW-16)**
- 16-lead SOIC wide body enhanced creepage version (RI-16-1)**
- High temperature operation: 105°C**
- Safety and regulatory approvals**
 - UL recognition: 5000 V rms for 1 minute per UL 1577
 - CSA Component Acceptance Notice #5A (RI-16-1 package)
 - IEC 60601-1: 250 V rms (reinforced)
 - IEC 60950-1: 400 V rms (reinforced)
 - VDE certificate of conformity
 - DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
 - V_{IORM} = 849 V peak

APPLICATIONS

- Isolated I²C, SMBus, or PMBus interfaces**
- Multilevel I²C interfaces**
- Power supplies**
- Networking**
- Power-over-Ethernet**

GENERAL DESCRIPTION

The ADuM2250/ADuM2251¹ are hot swappable digital isolators with nonlatching, bidirectional communication channels that are compatible with I²C interfaces. This eliminates the need for splitting I²C signals into separate transmit and receive signals for use with standalone optocouplers.

The ADuM2250 provides two bidirectional channels, supporting a complete isolated I²C interface. The ADuM2251 provides one bidirectional channel and one unidirectional channel for those applications where a bidirectional clock is not required.

The ADuM2250/ADuM2251 contain hot swap circuitry to prevent data glitches when an unpowered card is inserted onto an active bus.

These isolators are based on *iCoupler*[®] chip scale transformer technology from Analog Devices, Inc. *iCoupler* is a magnetic isolation technology with performance, size, power consumption, and functional advantages compared to optocouplers. The ADuM2250/ADuM2251 integrate *iCoupler* channels with semiconductor circuitry to enable a complete, isolated I²C interface in a small form factor package.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS

DC Specifications

All voltages are relative to their respective grounds. All minimum/maximum specifications apply over the entire recommended operating range, unless otherwise noted. All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, and $V_{DD2} = 5\text{ V}$, unless otherwise noted.

Table 1.

| Parameter | Symbol | Min | Typ | Max | Unit | Test Conditions/Comments |
|--|---|----------------------|------|----------------------|---------------|---|
| ADuM2250 | | | | | | |
| Input Supply Current, Side 1, 5 V | I_{DD1} | | 2.8 | 5.0 | mA | $V_{DD1} = 5\text{ V}$ |
| Input Supply Current, Side 2, 5 V | I_{DD2} | | 2.7 | 5.0 | mA | $V_{DD2} = 5\text{ V}$ |
| Input Supply Current, Side 1, 3.3 V | I_{DD1} | | 1.9 | 3.0 | mA | $V_{DD1} = 3.3\text{ V}$ |
| Input Supply Current, Side 2, 3.3 V | I_{DD2} | | 1.7 | 3.0 | mA | $V_{DD2} = 3.3\text{ V}$ |
| ADuM2251 | | | | | | |
| Input Supply Current, Side 1, 5 V | I_{DD1} | | 2.8 | 6.0 | mA | $V_{DD1} = 5\text{ V}$ |
| Input Supply Current, Side 2, 5 V | I_{DD2} | | 2.5 | 4.7 | mA | $V_{DD2} = 5\text{ V}$ |
| Input Supply Current, Side 1, 3.3 V | I_{DD1} | | 1.8 | 3.0 | mA | $V_{DD1} = 3.3\text{ V}$ |
| Input Supply Current, Side 2, 3.3 V | I_{DD2} | | 1.6 | 2.8 | mA | $V_{DD2} = 3.3\text{ V}$ |
| LEAKAGE CURRENTS | $I_{SDA1}, I_{SDA2},$ I_{SCL1}, I_{SCL2} | | 0.01 | 10 | μA | $V_{SDA1} = V_{DD1}, V_{SDA2} = V_{DD2},$ $V_{SCL1} = V_{DD1}, V_{SCL2} = V_{DD2}$ |
| SIDE 1 LOGIC LEVELS | | | | | | |
| Logic Input Threshold ¹ | V_{SDA1IL}, V_{SCL1IL} | 500 | | 700 | mV | |
| Logic Low Output Voltage | V_{SDA1OL}, V_{SCL1OL} | 600 | | 900 | mV | $I_{SDA1} = I_{SCL1} = 3.0\text{ mA}$ |
| Input/Output Logic Low Level Difference ² | $\Delta V_{SDA1}, \Delta V_{SCL1}$ | 600 | | 850 | mV | $I_{SDA1} = I_{SCL1} = 0.5\text{ mA}$ |
| SIDE 2 LOGIC LEVELS | | | | | | |
| Logic Low Input Voltage | V_{SDA2IL}, V_{SCL2IL} | | | $0.3 \times V_{DD2}$ | V | |
| Logic High Input Voltage | V_{SDA2IH}, V_{SCL2IH} | $0.7 \times V_{DD2}$ | | | V | |
| Logic Low Output Voltage | V_{SDA2OL}, V_{SCL2OL} | | | 400 | mV | $I_{SDA2} = I_{SCL2} = 30\text{ mA}$ |

¹ $V_{IL} < 0.5\text{ V}$, $V_{IH} > 0.7\text{ V}$.

² $\Delta V_{S1} = V_{S1OL} - V_{S1IL}$. This is the minimum difference between the output logic low level and the input logic low threshold within a given component. This ensures that there is no possibility of the part latching up the bus to which it is connected.

AC Specifications

All voltages are relative to their respective grounds. All minimum/maximum specifications apply over the entire recommended operating range, unless otherwise noted. All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, and $V_{DD2} = 5\text{ V}$, unless otherwise noted. See Figure 5 for a timing test diagram.

Table 2.

| Parameter | Symbol | Min | Typ | Max | Unit | Test Conditions/Comments |
|---|------------------|------|-----|-----|-------------|--|
| MAXIMUM FREQUENCY | | 1000 | | | kHz | |
| OUTPUT FALL TIME | | | | | | |
| 5 V Operation | | | | | | $4.5\text{ V} \leq V_{DD1}, V_{DD2} \leq 5.5\text{ V}, C_{L1} = 40\text{ pF}, R_1 = 1.6\text{ k}\Omega, C_{L2} = 400\text{ pF}, R_2 = 180\text{ }\Omega$ |
| Side 1 Output (0.9 V_{DD1} to 0.9 V) | t_{f1} | 13 | 26 | 120 | ns | |
| Side 2 Output (0.9 V_{DD2} to 0.1 V_{DD2}) | t_{f2} | 32 | 52 | 120 | ns | |
| 3 V Operation | | | | | | $3.0\text{ V} \leq V_{DD1}, V_{DD2} \leq 3.6\text{ V}, C_{L1} = 40\text{ pF}, R_1 = 1.0\text{ k}\Omega, C_{L2} = 400\text{ pF}, R_2 = 120\text{ }\Omega$ |
| Side 1 Output (0.9 V_{DD1} to 0.9 V) | t_{f1} | 13 | 32 | 120 | ns | |
| Side 2 Output (0.9 V_{DD2} to 0.1 V_{DD2}) | t_{f2} | 32 | 61 | 120 | ns | |
| PROPAGATION DELAY | | | | | | |
| 5 V Operation | | | | | | $4.5\text{ V} \leq V_{DD1}, V_{DD2} \leq 5.5\text{ V}, C_{L1} = C_{L2} = 0\text{ pF}, R_1 = 1.6\text{ k}\Omega, R_2 = 180\text{ }\Omega$ |
| Side 1 to Side 2, Rising Edge ¹ | t_{PLH12} | | 95 | 130 | ns | |
| Side 1 to Side 2, Falling Edge ² | t_{PHL12} | | 162 | 275 | ns | |
| Side 2 to Side 1, Rising Edge ³ | t_{PLH21} | | 31 | 70 | ns | |
| Side 2 to Side 1, Falling Edge ⁴ | t_{PHL21} | | 85 | 155 | ns | |
| 3 V Operation | | | | | | $3.0\text{ V} \leq V_{DD1}, V_{DD2} \leq 3.6\text{ V}, C_{L1} = C_{L2} = 0\text{ pF}, R_1 = 1.0\text{ k}\Omega, R_2 = 120\text{ }\Omega$ |
| Side 1 to Side 2, Rising Edge ¹ | t_{PLH12} | | 82 | 125 | ns | |
| Side 1 to Side 2, Falling Edge ² | t_{PHL12} | | 196 | 340 | ns | |
| Side 2 to Side 1, Rising Edge ³ | t_{PLH21} | | 32 | 75 | ns | |
| Side 2 to Side 1, Falling Edge ⁴ | t_{PHL21} | | 110 | 210 | ns | |
| PULSE WIDTH DISTORTION | | | | | | |
| 5 V Operation | | | | | | $4.5\text{ V} \leq V_{DD1}, V_{DD2} \leq 5.5\text{ V}, C_{L1} = C_{L2} = 0\text{ pF}, R_1 = 1.6\text{ k}\Omega, R_2 = 180\text{ }\Omega$ |
| Side 1 to Side 2, $ t_{PLH12} - t_{PHL12} $ | PWD_{12} | | 67 | 145 | ns | |
| Side 2 to Side 1, $ t_{PLH21} - t_{PHL21} $ | PWD_{21} | | 54 | 85 | ns | |
| 3 V Operation | | | | | | $3.0\text{ V} \leq V_{DD1}, V_{DD2} \leq 3.6\text{ V}, C_{L1} = C_{L2} = 0\text{ pF}, R_1 = 1.0\text{ k}\Omega, R_2 = 120\text{ }\Omega$ |
| Side 1 to Side 2, $ t_{PLH12} - t_{PHL12} $ | PWD_{12} | | 114 | 215 | ns | |
| Side 2 to Side 1, $ t_{PLH21} - t_{PHL21} $ | PWD_{21} | | 77 | 135 | ns | |
| COMMON-MODE TRANSIENT IMMUNITY ⁵ | $ CM_H , CM_L $ | 25 | 35 | | kV/ μ s | |

¹ t_{PLH12} propagation delay is measured from the Side 1 input logic threshold to an output value of 0.7 V_{DD2} .

² t_{PHL12} propagation delay is measured from the Side 1 input logic threshold to an output value of 0.4 V.

³ t_{PLH21} propagation delay is measured from the Side 2 input logic threshold to an output value of 0.7 V_{DD1} .

⁴ t_{PHL21} propagation delay is measured from the Side 2 input logic threshold to an output value of 0.9 V.

⁵ CM_H is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8 V_{DD2}$. CM_L is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O < 0.8\text{ V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.

PACKAGE CHARACTERISTICS

Table 3.

| Parameter | Symbol | Min | Typ | Max | Unit | Test Conditions/Comments |
|--|------------------|-----|------------------|-----|------|---|
| Resistance (Input to Output) ¹ | R _{I-O} | | 10 ¹² | | Ω | |
| Capacitance (Input to Output) ¹ | C _{I-O} | | 2.2 | | pF | f = 1 MHz |
| Input Capacitance | C _I | | 4.0 | | pF | |
| IC Junction-to-Ambient Thermal Resistance | θ _{JA} | | 45 | | °C/W | Thermocouple located at center of package underside |

¹ The device is considered a 2-terminal device; Pin 1 through Pin 8 are shorted together, and Pin 9 through Pin 16 are shorted together.

REGULATORY INFORMATION

The ADuM2250/ADuM2251 are approved by the organizations listed in Table 4.

Table 4.

| UL | CSA | VDE |
|---|---|---|
| Recognized under UL 1577 component recognition program ¹ | Approved under CSA Component Acceptance Notice #5A | Certified according to DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 ² |
| Single protection, 5000 V rms isolation voltage | Basic insulation per CSA 60950-1-07 and IEC 60950-1, 600 V rms (849 V peak) maximum working voltage RW-16 package: Reinforced insulation per CSA 60950-1-07 and IEC 60950-1, 380 V rms (537 V peak) maximum working voltage Reinforced insulation per IEC 60601-1, 125 V rms (176 V peak) maximum working voltage RI-16-1 package: Reinforced insulation per CSA 60950-1-07 and IEC 60950-1, 400 V rms (565 V peak) maximum working voltage Reinforced insulation per IEC 60601-1, 250 V rms (353 V peak) maximum working voltage | Reinforced insulation, 849 V peak |
| File E214100 | File 205078 | File 2471900-4880-0001 |

¹ In accordance with UL 1577, each ADuM2250/ADuM2251 is proof tested by applying an insulation test voltage ≥ 6000 V rms for 1 sec (current leakage detection limit = 10 μA).

² In accordance with DIN V VDE V 0884-10 (VDE V 0884-10):2006-12, each ADuM2250/ADuM2251 is proof tested by applying an insulation test voltage ≥ 1590 V peak for 1 sec (partial discharge detection limit = 5 pC). The asterisk (*) marking branded on the component designates DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 approval.

INSULATION AND SAFETY-RELATED SPECIFICATIONS

Table 5.

| Parameter | Symbol | Value | Unit | Test Conditions/Comments |
|--|--------|-----------|-------|--|
| Rated Dielectric Insulation Voltage | | 5000 | V rms | 1-minute duration |
| Minimum External Air Gap (Clearance) | L(I01) | 8.0 min | mm | Distance measured from input terminals to output terminals, shortest distance through air along the PCB mounting plane, as an aid to PC board layout |
| Minimum External Tracking (Creepage) | L(I02) | | | Measured from input terminals to output terminals, shortest distance path along body |
| RW-16 Package | | 7.7 min | mm | |
| RI-16-1 Package | | 8.3 min | mm | |
| Minimum Internal Distance (Internal Clearance) | | 0.017 min | mm | Insulation distance through insulation |
| Tracking Resistance (Comparative Tracking Index) | CTI | >175 | V | DIN IEC 112/VDE 0303, Part 1 |
| Isolation Group | | IIIa | | Material Group (DIN VDE 0110, 1/89, Table 1) |

DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 INSULATION CHARACTERISTICS

These isolators are suitable for reinforced isolation only within the safety limit data. Maintenance of the safety data is ensured by protective circuits. The asterisk (*) marking branded on the component designates DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 approval for an 849 V peak working voltage.

Table 6.

| Description | Test Conditions/Comments | Symbol | Characteristic | Unit |

| Side 1 (V_{SDA1} , V_{SCL1}) ¹ | -0.5 V to $V_{DD1} + 0.5\text{ V}$ |
| Side 2 (V_{SDA2} , V_{SCL2}) ¹ | -0.5 V to $V_{DD2} + 0.5\text{ V}$ |
| Average Output Current per Pin ² | |
| Side 1 (I_{O1}) | $\pm 18\text{ mA}$ |
| Side 2 (I_{O2}) | $\pm 100\text{ mA}$ |
| Common-Mode Transients ³ | $-100\text{ kV}/\mu\text{s}$ to $+100\text{ kV}/\mu\text{s}$ |

¹ All voltages are relative to their respective grounds.

² See Figure 3 for maximum rated current values for various temperatures.

³ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum rating may cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

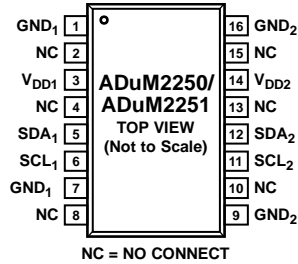

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES

1. PIN 1 AND PIN 7 ARE INTERNALLY CONNECTED TO EACH OTHER, AND IT IS RECOMMENDED THAT BOTH PINS BE CONNECTED TO A COMMON GROUND.
2. PIN 9 AND PIN 16 ARE INTERNALLY CONNECTED TO EACH OTHER, AND IT IS RECOMMENDED THAT BOTH PINS BE CONNECTED TO A COMMON GROUND.

09870-004

TEST CONDITIONS

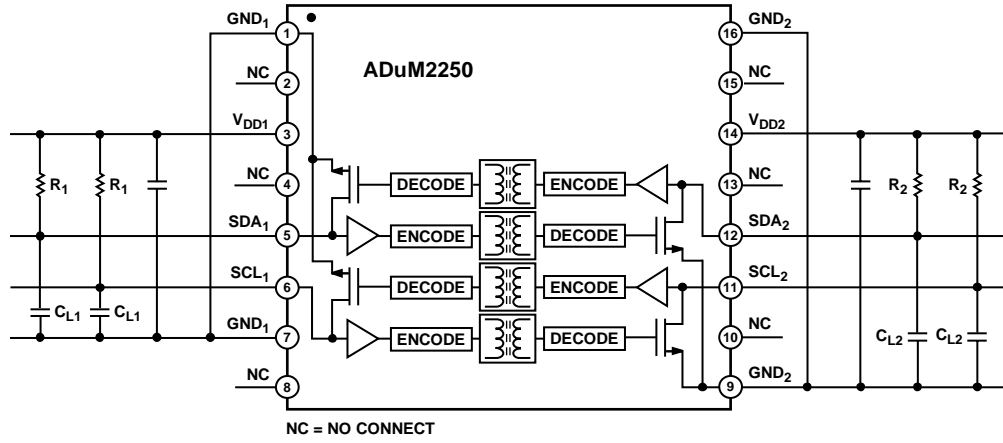

Figure 5. Timing Test Diagram

APPLICATIONS INFORMATION

FUNCTIONAL DESCRIPTION

The ADuM2250/ADuM2251 interface on each side to I²C signals. Internally, the bidirectional I²C signals are split into two unidirectional channels communicating in opposite directions via dedicated iCoupler isolation channels. One channel of each pair (the Side 1 input of each I/O pin in Figure 6) implements a special input buffer and output driver that can differentiate between externally generated inputs and its own output signals. It transfers only externally generated input signals to the corresponding Side 2 data or clock pin.

Both the Side 1 and Side 2 I²C pins are designed to interface to an I²C bus operating in the 3.0 V to 5.5 V range. A logic low on either side causes the corresponding I/O pin across the coupler to be pulled low enough to comply with the logic low threshold requirements of other I²C devices on the bus. Bus contention and latch-up are avoided by guaranteeing that the input low threshold at SDA₁ or SCL₁ is at least 50 mV less than the output low signal at the same pin. This prevents an output logic low at Side 1 from being transmitted back to Side 2 and pulling down the I²C bus by latching the state.

Because the Side 2 logic levels/thresholds and drive capabilities comply fully with standard I²C values, multiple ADuM2250/ADuM2251 devices connected to a bus by their Side 2 pins can communicate with each other and with other I²C-compatible devices, as shown in Figure 7. Note the distinction between I²C compatibility and I²C compliance. I²C compatibility refers to situations in which the logic levels or drive capability of a component do not necessarily meet the requirements of the I²C specification but still allow the component to communicate with an I²C-compliant device. I²C compliance refers to situations in which the logic levels and drive capability of a component fully meet the requirements of the I²C specification.

Because the Side 1 pin has a modified output level/input threshold, Side 1 of the ADuM2250/ADuM2251 can communicate only with devices that are fully compliant with the I²C standard. In other words, Side 2 of the ADuM2250/ADuM2251 is I²C-compliant, whereas Side 1 is only I²C-compatible.

The Side 1 I/O pins must not be connected to other I²C buffers that implement a similar scheme of dual I/O threshold detection. This latch-up prevention scheme is implemented in several popular I²C level shifting and bus extension products currently available from Analog Devices and other manufacturers. Care should be taken to review the data sheet of potential I²C bus buffering products to ensure that only one buffer on a bus segment implements a dual threshold scheme.

A bus segment is a portion of the I²C bus that is isolated from other portions of the bus by galvanic isolation, bus extenders, or level shifting buffers. Table 11 shows how multiple ADuM2250/ADuM2251 components can coexist on a bus as long as two Side 1 buffers are not connected to the same bus segment.

Table 11. ADuM2250/ADuM2251 Buffer Compatibility

| | Side 1 | Side 2 |
|--------|--------|--------|
| Side 1 | No | Yes |
| Side 2 | Yes | Yes |

The output logic low levels are independent of the V_{DD1} and V_{DD2} voltages. The input logic low threshold at Side 1 is also independent of V_{DD1}. However, the input logic low threshold at Side 2 is designed to be at 0.3 V_{DD2}, consistent with I²C requirements. The Side 1 and Side 2 I/O pins have open-collector outputs whose high levels are set via pull-up resistors to their respective supply voltages.

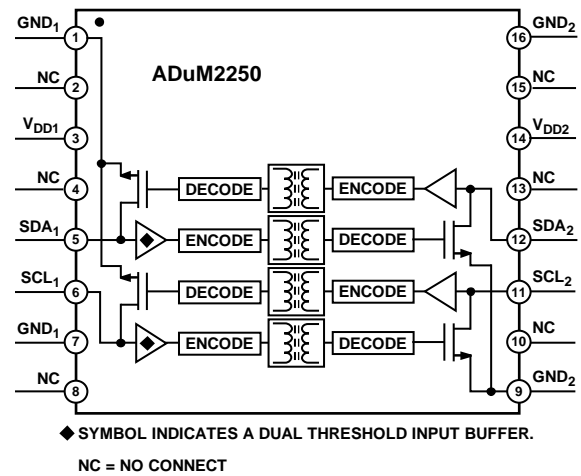

Figure 6. ADuM2250 Block Diagram

Figure 7 shows a typical application circuit, including the pull-up resistors required for both Side 1 and Side 2 buses. Bypass capacitors with values from 0.01 μF to 0.1 μF are required between V_{DD1} and GND₁ and between V_{DD2} and GND₂. The 200 Ω resistor shown in Figure 7 is required for latch-up immunity if the ambient temperature can be between 105°C and 125°C.

STARTUP

Both the V_{DD1} and V_{DD2} supplies have an undervoltage lockout feature that prevents the signal channels from operating unless certain criteria are met. This feature prevents the possibility of input logic low signals pulling down the I²C bus inadvertently during power-up/power-down.

For the signal channels to be enabled, the following criteria must be met:

- Both supplies must be at least 2.5 V.
- At least 40 μ s must elapse after both supplies exceed the internal start-up threshold of 2.0 V.

Until both criteria are met for both supplies, the ADuM2250/ADuM2251 outputs are pulled high, thereby ensuring a startup that avoids any disturbances on the bus. Figure 8 and Figure 9 illustrate the supply conditions for fast and slow input supply slew rates.

Figure 9. Start-Up Condition, Supply Slew Rate < 12.5 V/ms

MAGNETIC FIELD IMMUNITY

The ADuM2250/ADuM2251 are extremely immune to external magnetic fields. The limitation on the magnetic field immunity of the ADuM2250/ADuM2251 is set by the condition in which induced voltage in the receiving coil of the transformer is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADuM2250/ADuM2251 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V. The decoder has a sensing threshold at approximately 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt) \sum \pi r_n^2; n = 1, 2, \dots, N$$

where:

β is the magnetic flux density (gauss).

r_n is the radius of the nth turn in the receiving coil (cm).

N is the number of turns in the receiving coil.

Given the geometry of the receiving coil in the ADuM2250/ADuM2251 and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated, as shown in Figure 10.

Figure 10. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This voltage is approximately 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse (and is of the worst-case polarity), it reduces the received pulse from >1.0 V to 0.75 V—still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances away from the [ADuM2250/ADuM2251](#) transformers. Figure 11 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown in Figure 11, the [ADuM2250/ADuM2251](#) are extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example, a 0.5 kA current must be placed 5 mm away from the [ADuM2250/ADuM2251](#) to affect the operation of the component.

Note that at combinations of strong magnetic fields and high frequencies, any loops formed by printed circuit board traces can induce error voltages sufficiently large to trigger the thresholds of succeeding circuitry. Exercise care in the layout of such traces to avoid this possibility.
