

FEATURES

- Qualified for automotive applications
- Enhanced system level ESD performance per IEC 61000-4-x
- Low power operation
 - 5 V operation
 - 1.8 mA per channel maximum at 0 Mbps to 1 Mbps
 - 3.9 mA per channel maximum at 10 Mbps
 - 3 V operation
 - 1.2 mA per channel maximum at 0 Mbps to 1 Mbps
 - 2.4 mA per channel maximum at 10 Mbps
- Bidirectional communication
- 3 V/5 V level translation
- High temperature operation: 125°C
- High data rate: dc to 10 Mbps (NRZ)
- Precise timing characteristics
 - 3.5 ns maximum pulse width distortion
 - 3.5 ns maximum channel-to-channel matching
- High common-mode transient immunity: >25 kV/μs
- Output enable function
- 16-lead SOIC, wide body, RoHS compliant package
- Safety and regulatory approvals
 - UL recognition: 2500 V rms for 1 minute per UL 1577
 - CSA Component Acceptance Notice #5A
 - VDE certificate of conformity
 - DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
 - $V_{IORM} = 560$ V peak

APPLICATIONS

Hybrid electric vehicles, battery monitors, and motor drives

GENERAL DESCRIPTION

The ADuM3300W¹ and ADuM3301W¹ are triple-channel digital isolators based on Analog Devices, Inc., *iCoupler*® technology. Combining high speed CMOS and monolithic air core transformer technologies, these isolation components provide outstanding performance characteristics superior to alternatives, such as optocoupler devices.

iCoupler devices remove the usual optocoupler design difficulties. Typical optocoupler concerns regarding uncertain current transfer ratios, nonlinear transfer functions, and temperature and lifetime effects are eliminated by the simple *iCoupler* digital interfaces and stable performance characteristics. These *iCoupler* products also eliminate the need for external drivers and other discrete components. Furthermore, *iCoupler* devices consume one tenth to one sixth the power of optocouplers at comparable signal data rates.

¹ Protected by U.S. Patents 5,952,849; 6,873,065; and 7,075,329.

FUNCTIONAL BLOCK DIAGRAMS

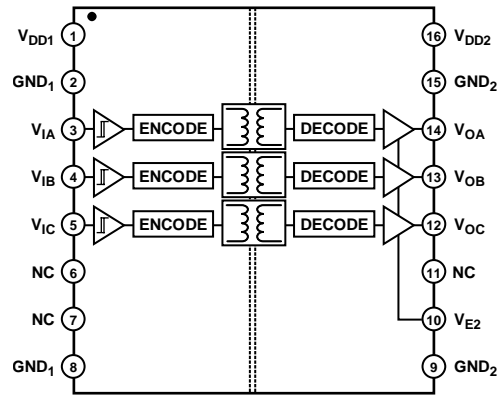

Figure 1. ADuM3300W

Figure 2. ADuM3301W

The ADuM3300W/ADuM3301W isolators provide three independent isolation channels in a variety of channel configurations and data rates (see the Ordering Guide). All models operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, providing compatibility with lower voltage systems, as well as enabling voltage translation functionality across the isolation barrier. In the absence of input logic transitions and during power-up/power-down conditions, the ADuM3300W/ADuM3301W isolators have a patented refresh feature that ensures dc correctness.

In comparison to the ADuM130x isolator family, the ADuM3300W/ADuM3301W isolators contain various circuit and layout changes that offer increased capability relative to system level IEC 61000-4-x testing (ESD, burst, and surge). The design and layout of the user's system determine the precise capability in the IEC 61000-4-x tests for the ADuM130x and ADuM3300W/ADuM3301W products.

REVISION HISTORY

4/13—Revision 0: Initial Version

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = V_{DD2} = 5\text{ V}$. Minimum/maximum specifications apply over the entire recommended operating range of $4.5\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$, $4.5\text{ V} \leq V_{DD2} \leq 5.5\text{ V}$, and $-40^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$, unless otherwise noted. Switching specifications are tested with $C_L = 15\text{ pF}$ and CMOS signal levels, unless otherwise noted.

¹ $|CM|$ is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8 V_{DD}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. $V_{CM} = 1000$ V, transient magnitude = 800 V.

ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = V_{DD2} = 3.3$ V. Minimum/maximum specifications apply over the entire recommended operation range of $3.0\text{ V} \leq V_{DD1} \leq 3.6\text{ V}$, $3.0\text{ V} \leq V_{DD2} \leq 3.6\text{ V}$, and $-40^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$, unless otherwise noted. Switching specifications are tested with $C_L = 15$ pF and CMOS signal levels, unless otherwise noted.

¹ The device is considered a 2-terminal device; Pin 1 through Pin 8 are shorted together, and Pin 9 through Pin 16 are shorted together.

² Input capacitance is from any input data pin to ground.

REGULATORY INFORMATION

The ADuM3300W/ADuM3301W are approved by the organizations listed in Table 14. See Table 19 and the Insulation Lifetime section for more information regarding recommended maximum working voltages for specific cross isolation waveforms and insulation levels.

Table 14.

| UL | CSA | VDE |
|---|---|--|
| Recognized under UL 1577 component recognition program ¹ | Approved under CSA Component Acceptance Notice #5A | Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12 ² |
| Single insulation, 2500 V rms Isolation Voltage | Basic insulation per CSA 60950-1-03 and IEC 60950-1, 400 V rms (566 V peak) maximum working voltage | Reinforced insulation, 560 V peak |
| File E214100 | File 205078 | File 2471900-4880-0001 |

¹ In accordance with UL 1577, each ADuM3300W/ADuM3301W is proof tested by applying an insulation test voltage of ≥3000 V rms for 1 sec (current leakage detection limit = 5 μA).

² In accordance with DIN V VDE V 0884-10, each ADuM3300W/ADuM3301W is proof tested by applying an insulation test voltage of ≥1050 V peak for 1 sec (partial discharge detection limit = 5 pC). An asterisk (*) marking branded on the component designates DIN V VDE V 0884-10 approval.

¹ All voltages are relative to their respective grounds. See the DC Correctness and Magnetic Field Immunity section for information on immunity to external magnetic fields.

ABSOLUTE MAXIMUM RATINGS

Ambient temperature = 25°C, unless otherwise noted.

Table 18.

| Parameter | Rating ¹ |
|---|------------------------------------|
| Temperature Range | |
| Storage (T _{ST}) | –65°C to +150°C |
| Operating (Ambient, T _A) | –40°C to +125°C |
| Supply Voltages ¹ (V _{DD1} , V _{DD2}) | –0.5 V to +7.0 V |
| Input Voltage ^{1,2} (V _{IA} , V _{IB} , V _{IC} , V _{E1} , V _{E2}) | –0.5 V to V _{DD1} + 0.5 V |
| Output Voltage ^{1,2} (V _{OA} , V _{OB} , V _{OC}) | –0.5 V to V _{DD0} + 0.5 V |
| Average Output Current per Pin ³ | |
| Side 1 (I _{O1}) | –10 mA to +10 mA |
| Side 2 (I _{O2}) | –10 mA to +10 mA |
| Common-Mode Transients ⁴ (CM _H , CM _L) | –100 kV/μs to +100 kV/μs |

¹ V_{DD1} and V_{DD0} refer to the supply voltages on the input and output sides of a given channel, respectively.

² All voltages are relative to their respective grounds.

³ See Figure 3 for maximum rated power values for various temperatures.

⁴ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum rating can cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 19. Maximum Continuous Working Voltage¹

| Parameter | Max | Unit | Constraint |
|-------------------------------|------|--------|--------------------------|
| AC Voltage, Bipolar Waveform | 560 | V peak | 50-year minimum lifetime |
| AC Voltage, Unipolar Waveform | | | |
| Basic Insulation | 1131 | V peak | 50-year minimum lifetime |
| DC Voltage | | | |
| Basic Insulation | 1131 | V peak | 50-year minimum lifetime |

¹ Refers to continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more information.

Table 20. Truth Table Abbreviations

| Letter | Description |
|--------|-------------------------|
| H | High level |
| L | Low level |
| NC | No connect |
| X | Irrelevant (don't care) |
| Z | High impedance |

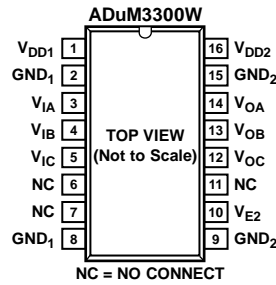

Table 21. Truth Table (Positive Logic)

| V _{ix} Input ¹ | V _{Ex} Input ² | V _{DD1} State ¹ | V _{DD0} State ¹ | V _{Ox} Output ¹ | Notes |
|------------------------------------|------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|---|
| H | H or NC | Powered | Powered | H | |
| L | H or NC | Powered | Powered | L | |
| X | L | Powered | Powered | Z | |
| X | H or NC | Unpowered | Powered | H | Outputs return to the input state within 1 μs of V _{DD1} power restoration. |
| X | L | Unpowered | Powered | Z | |
| X | X | Powered | Unpowered | Indeterminate | Outputs return to the input state within 1 μs of V _{DD0} power restoration when the V _{Ex} state is H or NC. Outputs return to a high impedance state within 8 ns of V _{DD0} power restoration when the V _{Ex} state is L. |

¹ V_{ix} and V_{Ox} refer to the input and output signals of a given channel (A, B, or C). V_{Ex} refers to the output enable signal on the same side as the V_{Ox} outputs. V_{DD1} and V_{DD0} refer to the supply voltages on the input and output sides of a given channel, respectively.

² In noisy environments, connecting V_{Ex} to an external logic high or low is recommended.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES

1. PIN 2 AND PIN 8 ARE INTERNALLY CONNECTED TO EACH OTHER, AND IT IS RECOMMENDED THAT BOTH PINS BE CONNECTED TO A COMMON GROUND.
2. PIN 9 AND PIN 15 ARE INTERNALLY CONNECTED TO EACH OTHER, AND IT IS RECOMMENDED THAT BOTH PINS BE CONNECTED TO A COMMON GROUND.

APPLICATIONS INFORMATION

PRINTED CIRCUIT BOARD LAYOUT

The ADuM3300W/ADuM3301W digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 14). Bypass capacitors are most conveniently connected between Pin 1 and Pin 2 for V_{DD1} and between Pin 15 and Pin 16 for V_{DD2} . Use capacitor values between 0.01 μF and 0.1 μF . Do not exceed 2 mm for total lead length between both ends of the capacitor and the input power supply pin. Consider bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16, unless the ground pair on each package side is connected close to the package.

Figure 14. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, ensure that board coupling across the isolation barrier is minimized. Furthermore, design the board layout such that any coupling that does occur affects all pins equally on a given component side. Failure to ensure this can cause voltage differentials between pins, thereby exceeding the absolute maximum ratings for the device, leading to latch-up or permanent damage. See the AN-1109 Application Note for board layout guidelines.

SYSTEM LEVEL ESD CONSIDERATIONS AND ENHANCEMENTS

System level ESD reliability (for example, per IEC 61000-4-x) is highly dependent on system design, which varies widely by application. The ADuM3300W/ADuM3301W incorporate many enhancements to make ESD reliability less dependent on system design. The enhancements include

- ESD protection cells are added to all input/output interfaces.
- Key metal trace resistances are reduced using wider geometry and paralleling of lines with vias.
- Guarding and isolation technique employed between the PMOS and NMOS devices minimizes the SCR effect inherent in CMOS devices.
- 45° corners on metal traces eliminate areas of high electric field concentration.
- Larger ESD clamps between each supply pin and its respective ground prevent supply pin overvoltage.

Although the ADuM3300W/ADuM3301W improve system level ESD reliability, these devices are no substitute for a robust system level design. See the AN-793 Application Note, *ESD/Latch-Up Considerations with iCoupler® Isolation Products*, for detailed recommendations on board layout and system level design.

PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The propagation delay to a logic low output can differ from the propagation delay to a logic high output (see Figure 15).

Figure 15. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately timing of the input signal is preserved.

Channel-to-channel matching refers to the maximum amount that the propagation delay differs between channels within a single ADuM3300W or ADuM3301W component.

Propagation delay skew refers to the maximum amount that the propagation delay differs between multiple ADuM3300W and ADuM3301W components operating under the same conditions.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (~1 ns) pulses to be sent to the decoder via the transformer. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than ~1 μs , a periodic set of refresh pulses indicative of the correct input state is sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than approximately 5 μs , the input side is assumed to be unpowered or nonfunctional, in which case the isolator output is forced to a default state by the watchdog timer circuit (see Table 21).

The limitation on the magnetic field immunity of the ADuM3300W/ADuM3301W is set by the condition in which induced voltage in the receiving coil of the transformer is sufficiently large to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3 V operating condition of the ADuM3300W/ADuM3301W is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V. The decoder has a sensing threshold at about 0.5 V, establishing a 0.5 V margin in which induced voltages are tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt) \sum \pi r_n^2; n = 1, 2, \dots, N$$

where:

β is the magnetic flux density (gauss).

r_n is the radius of the n^{th} turn in the receiving coil (cm).

N is the number of turns in the receiving coil.

Given the geometry of the receiving coil in the [ADuM3300W/ADuM3301W](#) and an imposed requirement that the induced voltage is at most 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated, as shown in Figure 16.

Figure 16. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such a magnetic field event were to occur during a transmitted pulse (and was of the worst-case polarity), it would reduce the received pulse from >1.0 V to 0.75 V—still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the [ADuM3300W](#) or [ADuM3301W](#) transformers. Figure 17 expresses these allowable current magnitudes as a function of frequency for selected distances. The [ADuM3300W/ADuM3301W](#) are extremely immune and can be affected only by extremely large currents operating at high frequency very close to the component (see Figure 17). For the 1 MHz example noted, a 0.5 kA current would have to be placed 5 mm away from the [ADuM3300W](#) or [ADuM3301W](#) to affect the operation of the component.

Figure 17. Maximum Allowable Current for Various Current to [ADuM3300W/ADuM3301W](#) Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board (PCB) traces can induce error voltages sufficiently large enough to trigger the thresholds of succeeding circuitry. Take care in the layout of such traces to avoid this possibility.

POWER CONSUMPTION

The supply current at a given channel of the [ADuM3300W](#) or [ADuM3301W](#) isolator is a function of the supply voltage, the data rate of the channel, and the output load of the channel.

For each input channel, the supply current is given by

$$I_{DDI} = I_{DDI(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDI} = I_{DDI(D)} \times (2f - f_r) + I_{DDI(Q)} \quad f > 0.5 f_r$$

For each output channel, the supply current is given by

$$I_{DDO} = I_{DDO(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDO} = (I_{DDO(D)} + (0.5 \times 10^{-3}) \times C_L \times V_{DDO}) \times (2f - f_r) + I_{DDO(Q)} \quad f > 0.5 f_r$$

where:

$I_{DDI(D)}$, $I_{DDO(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).

C_L is the output load capacitance (pF).

V_{DDO} is the output supply voltage (V).

f is the input logic signal frequency (MHz); it is half of the input data rate expressed in units of Mbps.

f_r is the input stage refresh rate (Mbps).

$I_{DDI(Q)}$, $I_{DDO(Q)}$ are the specified input and output quiescent supply currents (mA).

To calculate the total I_{DD1} and I_{DD2} supply current, the supply currents for each input and output channel corresponding to V_{DD1} and V_{DD2} are calculated and totaled. Figure 6 provides per channel input supply current as a function of data rate. Figure 7 and Figure 8 provide per channel output supply current as a function of data rate for an unloaded output condition and for a 15 pF output condition, respectively. Figure 9 through Figure 12 provide total V_{DD1} and V_{DD2} supply current as a function of data rate for [ADuM3300W/ADuM3301W](#) channel configurations.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation. In addition to the testing performed by the regulatory agencies, Analog Devices executes an extensive set of evaluations to determine the lifetime of the insulation structure within the [ADuM3300W](#) and [ADuM3301W](#).

Analog Devices performs accelerated life testing using voltage levels higher than the rated continuous working voltage. Acceleration factors for several operating conditions are determined. These factors allow calculation of the time to failure at the actual working voltage.

The values shown in Table 19 summarize the peak voltage for 50 years of service life. In many cases, the approved working voltage is higher than the 50-year service life voltage. Operation at these high working voltages can lead to shortened insulation life.

The insulation lifetime of the [ADuM3300W/ADuM3301W](#) depends on the voltage waveform type imposed across the isolation barrier. The *i*Coupler insulation structure degrades at different rates, depending on whether the waveform is bipolar ac, unipolar ac, or dc. Figure 18, Figure 19, and Figure 20 illustrate these different isolation voltage waveforms.

Bipolar ac voltage is the most stringent environment. The goal of a 50-year operating lifetime under the bipolar ac condition determines the maximum working voltage recommended by Analog Devices.

In the case of unipolar ac or dc voltage, the stress on the insulation is significantly lower. This allows operation at higher working voltages while still achieving a 50-year service life. The working voltages listed in Table 19 can be applied while maintaining the 50-year minimum lifetime, provided that the voltage conforms to either the unipolar ac or dc voltage cases. Treat any cross insulation voltage waveform that does not conform to Figure 19 or Figure 20 as a bipolar ac waveform, and limit its peak voltage to the 50-year lifetime voltage value listed in Table 19.

Note that the voltage presented in Figure 19 is shown as sinusoidal for illustration purposes only. It is meant to represent any voltage waveform varying between 0 V and some limiting value. The limiting value can be positive or negative, but the voltage cannot cross 0 V.
