

## 1. Features

- Medium-voltage and Standard-voltage Operation
  - 2.7 ( $V_{CC} = 2.7V$  to 5.5V)
- Automotive Temperature Range  $-40^{\circ}C$  to  $+125^{\circ}C$
- User Selectable Internal Organization
  - 16K: 2048 x 8 or 1024 x 16
- 3-wire Serial Interface
- Sequential Read Operation
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- 2 MHz Clock Rate (5V) Compatibility
- Self-timed Write Cycle (10 ms max)
- High Reliability
  - Endurance: 1 Million Write Cycles
  - Data Retention: 100 Years
- Lead-Free/Halogen-Free Devices Available
- 8-lead JEDEC SOIC and 8-lead TSSOP Packages

## 2. Description

The AT93C86A provides 16384 bits of serial electrically erasable programmable read only memory (EEPROM), organized as 1024 words of 16 bits each when the ORG pin is connected to  $V_{CC}$  and 2048 words of 8 bits each when it is tied to ground. The device is optimized for use in many automotive applications where low-power and low-voltage operations are essential. The AT93C86A is available in space saving 8-lead JEDEC SOIC and 8-lead TSSOP packages.

**Table 2-1.** Pin Configuration

Pin Name	Function
CS	Chip Select
SK	Serial Data Clock
DI	Serial Data Input
DO	Serial Data Output
GND	Ground
VCC	Power Supply
ORG	Internal Organization
DC	Don't Connect

The AT93C86A is enabled through the Chip Select pin (CS), and accessed via a three-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a Read instruction at DI, the address is decoded and the data is clocked out serially on the data output pin DO. The write cycle is completely self-timed and no separate erase cycle is required before Write. The write cycle is only enabled when the part is in the Erase/Write Enable state. When CS is brought "high" following the initiation of a write cycle, the DO pin outputs the Ready/Busy status of the part. The AT93C86A is available in a 2.7V to 5.5V version.

## Three-wire Automotive Temperature Serial EEPROM

16K (2048 x 8 or 1024 x 16)

## AT93C86A

## Absolute Maximum Ratings\*

Operating Temperature.....	-55°C to +125°C
Storage Temperature .....	-65°C to +150°C
Voltage on any Pin with Respect to Ground .....	-1.0V to +7.0V
Maximum Operating Voltage .....	6.25V
DC Output Current.....	5.0 mA

**\*NOTICE:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Figure 2-1.** Block Diagram

Note: When the ORG pin is connected to Vcc, the x 16 organization is selected. When it is connected to ground, the x 8 organization is selected. If the ORG pin is left unconnected and the application does not load the input beyond the capability of the internal 1 Meg ohm pullup, then the x 16 organization is selected.

**Table 2-2.** Pin Capacitance<sup>(1)</sup>

Applicable over recommended operating range from  $T_A = 25^\circ\text{C}$ ,  $f = 1.0\text{ MHz}$ ,  $V_{CC} = +5.0\text{V}$  (unless otherwise noted)

Symbol	Test Conditions	Max	Units	Conditions
$C_{OUT}$	Output Capacitance (DO)	5	pF	$V_{OUT} = 0\text{V}$
$C_{IN}$	Input Capacitance (CS, SK, DI)	5	pF	$V_{IN} = 0\text{V}$

Note: 1. This parameter is characterized and is not 100% tested.

**Table 2-3.** DC Characteristics

Applicable over recommended operating range from:  $T_A = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $V_{CC} = +2.7\text{V}$  to  $+5.5\text{V}$  (unless otherwise noted)

Symbol	Parameter	Test Condition		Min	Typ	Max	Unit
$V_{CC1}$	Supply Voltage			2.7		5.5	V
$V_{CC2}$	Supply Voltage			4.5		5.5	V
$I_{CC}$	Supply Current	$V_{CC} = 5.0\text{V}$	READ at 1.0 MHz		0.5	2.0	mA
			WRITE at 1.0 MHz		0.5	2.0	mA
$I_{SB1}$	Standby Current	$V_{CC} = 2.7\text{V}$	CS = 0V		6.0	10.0	$\mu\text{A}$
$I_{SB2}$	Standby Current	$V_{CC} = 5.0\text{V}$	CS = 0V		10.0	15.0	$\mu\text{A}$
$I_{IL}$	Input Leakage	$V_{IN} = 0\text{V}$ to $V_{CC}$			0.1	3.0	$\mu\text{A}$
$I_{OL}$	Output Leakage	$V_{IN} = 0\text{V}$ to $V_{CC}$			0.1	3.0	$\mu\text{A}$
$V_{IL1}^{(1)}$ $V_{IH1}^{(1)}$	Input Low Voltage Input High Voltage	$2.7\text{V} \leq V_{CC} \leq 5.5\text{V}$		-----0.6		0.8	V
				2.0		$V_{CC} + 1$	V
$V_{OL1}$ $V_{OH1}$	Output Low Voltage Output High Voltage	$2.7\text{V} \leq V_{CC} \leq 5.5\text{V}$	$I_{OL} = 2.1\text{ mA}$			0.4	V
			$I_{OH} = -0.4\text{ mA}$	2.4			V

Note: 1.  $V_{IL}$  min and  $V_{IH}$  max are reference only and are not tested.

**Table 2-4.** AC Characteristics

Applicable over recommended operating range from  $T_A = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $V_{CC} = \text{As Specified}$ ,

Note: 1. This parameter is characterized and is not 100% tested.

**Table 2-5.** Instruction Set for the AT93C86A

Instruction	SB	Op Code	Address		Data		Comments
			x 8	x 16	x 8	x 16	
READ	1	10	$A_{10} - A_0$	$A_9 - A_0$			Reads data stored in memory, at specified address.
EWEN	1	00	11XXXXXXXXXX	11XXXXXXXXXX			Write enable must precede all programming modes.
ERASE	1	11	$A_{10} - A_0$	$A_9 - A_0$			Erases memory location $A_n - A_0$ .
WRITE	1	01	$A_{10} - A_0$	$A_9 - A_0$	$D_7 - D_0$	$D_{15} - D_0$	Writes memory location $A_n - A_0$ .
ERAL	1	00	10XXXXXXXXXX	10XXXXXXXXXX			Erases all memory locations. Valid only at $V_{CC} = 4.5V$ to $5.5V$ .
WRAL	1	00	01XXXXXXXXXX	01XXXXXXXXXX	$D_7 - D_0$	$D_{15} - D_0$	Writes all memory locations. Valid when $V_{CC} = 4.5V$ to $5.5V$ and Disable Register cleared.
EWDS	1	00	00XXXXXXXXXX	00XXXXXXXXXX			Disables all programming instructions.

### 3. Functional Description

The AT93C86A is accessed via a simple and versatile 3-wire serial communication interface. Device operation is controlled by seven instructions issued by the host processor. *A valid instruction starts with a rising edge of CS and consists of a Start Bit (logic “1”) followed by the appropriate Op Code and the desired memory address location.*

**READ (READ):** The Read (READ) instruction contains the address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the serial output pin DO. Output data changes are synchronized with the rising edges of serial clock SK. It should be noted that a dummy bit (logic “0”) precedes the 8- or 16-bit data output string. The AT93C86A supports sequential read operations. The device will automatically increment the internal address pointer and clock out the next memory location as long as CS is held high. In this case, the dummy bit (logic “0”) will not be clocked out between memory locations, thus allowing for a continuous stream of data to be read.

**ERASE/WRITE (EWEN):** To assure data integrity, the part automatically goes into the Erase/Write Disable (EWDS) state when power is first applied. An Erase/Write Enable (EWEN) instruction must be executed first before any programming instructions can be carried out. Please note that once in the EWEN state, programming remains enabled until an EWDS instruction is executed or  $V_{CC}$  power is removed from the part.

**ERASE (ERASE):** The Erase (ERASE) instruction programs all bits in the specified memory location to the logical “1” state. The self-timed erase cycle starts once the Erase instruction and address are decoded. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). A logic “1” at pin DO indicates that the selected memory location has been erased, and the part is ready for another instruction.

**WRITE (WRITE):** The Write (WRITE) instruction contains the 8 or 16 bits of data to be written into the specified memory location. The self-timed programming cycle  $t_{WP}$  starts after the last bit of data is received at serial data input pin DI. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). A logic “0” at DO indicates that programming is still in progress. A logic “1” indicates that the memory location at the specified address has been written with the data pattern contained in the instruction and the part is ready for further instructions. *A Ready/Busy status cannot be obtained if the CS is brought high after the end of the self-timed programming cycle  $t_{WP}$ .*

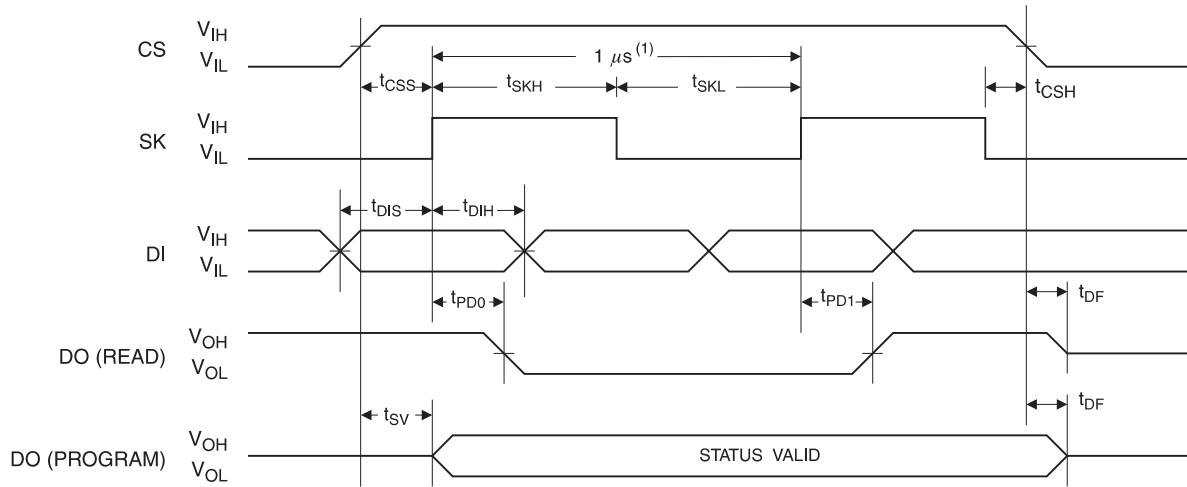

**ERASE ALL (ERAL):** The Erase All (ERAL) instruction programs every bit in the memory array to the logic “1” state and is primarily used for testing purposes. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). The Eral instruction is valid only at  $V_{CC} = 5.0V \pm 10\%$ .

**WRITE ALL (WRAL):** The Write All (WRAL) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of 250 ns ( $t_{CS}$ ). The Wral instruction is valid only at  $V_{CC} = 5.0V \pm 10\%$ .

**ERASE/WRITE DISABLE (EWDS):** To protect against accidental data disturbance, the Erase/Write Disable (EWDS) instruction disables all programming modes and should be executed after all programming operations. The operation of the Read instruction is independent of both the Ewen and Ewds instructions and can be executed at any time.
