

## 14-Bit, 105MSPS Analog-To-Digital Converter

### FEATURES

- 14-Bit Resolution
- 105MSPS Sample Rate
- High SNR: 72dBFS at 100MHz  $f_{IN}$
- High SFDR: 86dBc at 100MHz  $f_{IN}$
- 2.3V<sub>PP</sub> Differential Input Voltage
- Internal Voltage Reference
- 3.3V Single-Supply Voltage
- Analog Power Dissipation: 571mW
- Serial Programming Interface
- TQFP-64 PowerPAD™ Package
- Pin-Compatible With:
  - ADS5500 (14-Bit, 125MSPS)
  - ADS5542 (14-Bit, 80MSPS)
  - ADS5520 (12-Bit, 125MSPS)
  - ADS5521 (12-Bit, 105MSPS)
  - ADS5522 (12-Bit, 80MSPS)
- Recommended Op Amps:
  - OPA695, OPA847, THS3202, THS3201, THS4503, THS4509, THS9001

### APPLICATIONS

- Wireless Communication
  - Communication Receivers
  - Base Station Infrastructure
- Test and Measurement Instrumentation
- Single and Multichannel Digital Receivers
- Communication Instrumentation
  - Radar, Infrared
- Video and Imaging
- Medical Equipment
- Military Equipment

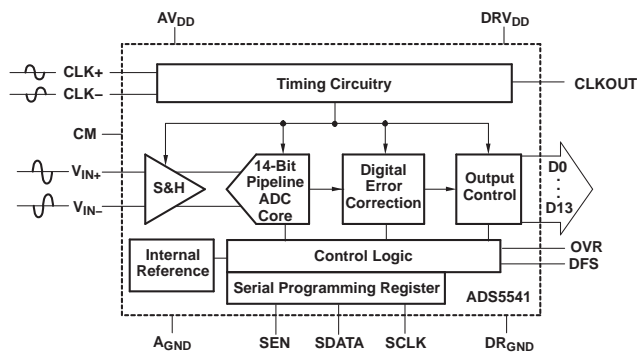

### DESCRIPTION

The ADS5541 is a high-performance, 14-bit, 105MSPS analog-to-digital converter (ADC). To provide a complete converter solution, it includes a high-bandwidth linear sample-and-hold stage (S&H) and internal reference. Designed for applications demanding the highest speed and highest dynamic performance in a small space, the ADS5541 has excellent analog power dissipation of 571mW at 3.3V single-supply voltage. This allows an even higher system integration density. The provided internal reference simplifies system design requirements. The parallel CMOS compatible outputs ensure seamless interfacing with common logic.

The ADS5541 is available in a TQFP-64 PowerPAD package over the industrial temperature range.

### ADS5500 PRODUCT FAMILY

	80MSPS	105MSPS	125MSPS
12-Bit	ADS5522	ADS5521	ADS5542
14-Bit	ADS5542	ADS5541	ADS5500

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**ORDERING INFORMATION<sup>(1)</sup>**

PRODUCT	PACKAGE-LEAD <sup>(2)</sup>	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ADS5541	HTQFP-64 PowerPAD	PAP	–40°C to +85°C	ADS5541I	ADS5541IPAP	Tray, 160
					ADS5541IPAPR	Tape and Reel, 1000

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).
- (2) Thermal pad size: 3.5mm x 3.5mm (min), 4mm x 4mm (max).  $\theta_{JA} = 21.47^{\circ}\text{C/W}$  and  $\theta_{JC} = 2.99^{\circ}\text{C/W}$ , when used with 2 oz. copper trace and pad soldered directly to a JEDEC standard, four-layer, 3in x 3in PCB.

**ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>**

Over operating free-air temperature range, unless otherwise noted.

		ADS5541	UNIT
Supply Voltage	$AV_{DD}$ to $A_{GND}$ , $DRV_{DD}$ to $DR_{GND}$	–0.3 to 3.7	V
	$A_{GND}$ to $DR_{GND}$	±0.1	V
Analog input to $A_{GND}$ <sup>(2)(3)</sup>		–0.3 to minimum ( $AV_{DD} + 0.3$ , +3.6)	V
Logic input to $DR_{GND}$		–0.3 to $DRV_{DD}$	V
Digital data output to $DR_{GND}$		–0.3 to $DRV_{DD}$	V
Operating temperature range		–40 to 85	°C
Junction temperature		105	°C
Storage temperature range		–65 to 150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) If the input signal can exceed 3.6V, then a resistor greater than or equal to 25Ω should be added in series with each of the analog input pins to support input voltages up to 3.8V. For input voltages above 3.8V, the device can only handle transients and the duty cycle of the overshoot should be limited to less than 5% for inputs up to 3.9V.
- (3) The overshoot duty cycle can be defined as the ratio of the total time of overshoot to the total intended device lifetime, expressed as a percentage. The total time of overshoot is the integrated time of all overshoot occurrences over the lifetime of the device.

**RECOMMENDED OPERATING CONDITIONS**

	ADS5541			UNIT
	MIN	TYP	MAX	
<b>Supplies</b>				
Analog supply voltage, $AV_{DD}$	3	3.3	3.6	V
Output driver supply voltage, $DRV_{DD}$	3	3.3	3.6	V
<b>Analog Input</b>

NOTE: It is recommended that the loading at CLKOUT and all data lines are accurately matched to ensure that the above timing matches closely with the specified values.

Figure 1. Timing Diagram

**TIMING CHARACTERISTICS<sup>(1)(2)</sup>**

At  $T_A = +25^\circ\text{C}$ , min and max specified over the full temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ , sampling rate = 105MSPS, 50% clock duty cycle,  $AV_{DD} = DRV_{DD} = 3.3\text{V}$ , and  $3V_{PP}$  differential clock, unless otherwise noted.

PARAMETER	DESCRIPTION	ADS5541			UNIT			
		MIN	TYP	MAX				
<b>Switching Specification</b>								
$t_A$	Aperture delay	Input CLK falling edge to data sampling point			1	ns		
	Aperture jitter (uncertainty)	Uncertainty in sampling instant			300	fs		
$t_{SU}$	Data setup time	Data valid <sup>(3)</sup> to 50% of CLKOUT rising edge			2.2	2.8	ns	
$t_H$	Data hold time	50% of CLKOUT rising edge to data becoming invalid <sup>(3)</sup>			2.2	2.5	ns	
$t_{START}^{(4)(5)}$	Input clock to output data valid start	Input clock rising edge to data valid start delay			1.9	2.8	ns	
$t_{END}^{(4)(5)}$	Input clock to output data valid end	Input clock rising edge to data valid end delay			5.8	7.3	ns	
$t_{JIT}$	Output clock jitter	Uncertainty in CLKOUT rising edge, peak-to-peak			175	250	ps	
$t_{RISE}$	Output clock rise time	Rise time of CLKOUT from 20% to 80% of $DRV_{DD}$			2	2.2	ns	
$t_{FALL}$	Output clock fall time	Fall time of CLKOUT from 80% to 20% of $DRV_{DD}$			1.7	1.8	ns	
$t_{PDI}$	Input clock to output clock delay	Input clock rising edge, zero crossing, to output clock rising edge 50%			4	4.7	5.5	ns
$t_R$	Data rise time	Data rise time measured from 20% to 80% of $DRV_{DD}$			4.4	5.1	ns	
$t_F$	Data fall time	Data fall time measured from 80% to 20% of $DRV_{DD}$			3.3	3.8	ns	
	Output enable(OE) to data output delay	Time required for outputs to have stable timings with regard to input clock <sup>(6)</sup> after OE is activated			1000		Clock cycles	
	Wakeup time	Time to valid data after coming out of software power down and stopping and restarting the clock			1000		Clock cycles	
	Latency	Time for a sample to propagate to the ADC outputs			17.5		Clock cycles	

- (1) Timing parameters are ensured by design and characterization and not tested in production.
- (2) See Table 5 through Table 8 in the Application Information section for timing information at additional sampling frequencies.
- (3) Data valid refers to 2V for LOGIC high and 0.8V for LOGIC low.
- (4) See the Output Information section for details on using the input clock for data capture.
- (5) These specifications apply when the CLKOUT polarity is set to rising edge (according to Table 3). Add 1/2 clock period for the valid number for a falling edge CLKOUT polarity.
- (6) Data outputs are available within a clock from assertion of OE; however, it takes 1000 clock cycles to ensure stable timing with respect to input clock.

Figure 2. Reset Timing Diagram

## RESET TIMING CHARACTERISTICS

Typical values given at  $T_A = +25^\circ\text{C}$ , min and max specified over the full temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ ,  $AV_{DD} = DRV_{DD} = 3.3\text{V}$ , and  $3V_{PP}$  differential clock, unless otherwise noted.

PARAMETER	DESCRIPTION	ADS5541			UNIT
		MIN	TYP	MAX	
<b>Switching Specification</b>					
$t_1$	Power-on delay	Delay from power-on of $AV_{DD}$ and $DRV_{DD}$ to RESET pulse		10	ms
$t_2$	Reset pulse width	Pulse width of active RESET signal		2	$\mu\text{s}$
$t_3$	Register write delay	Delay from RESET disable to SEN active		2	$\mu\text{s}$
	Power-up time	Delay from power-up of $AV_{DD}$ and $DRV_{DD}$ to output stable		40	ms

### SERIAL PROGRAMMING INTERFACE CHARACTERISTICS

The ADS5541 has a three-wire serial interface. The device latches the serial data SDATA on the falling edge of serial clock SCLK when SEN is active.

- Serial shift of bits is enabled when SEN is low. SCLK shifts serial data at the falling edge.
- Minimum width of data stream for a valid loading is 16 clocks.
- Data is loaded at every 16th SCLK falling edge while SEN is low.
- In case the word length exceeds a multiple of 16 bits, the excess bits are ignored.
- Data can be loaded in multiples of 16-bit words within a single active SEN pulse.
- The first 4-bit nibble is the address of the register while the last 12 bits are the register contents.

Figure 3. DATA Communication is 2-Byte, MSB First

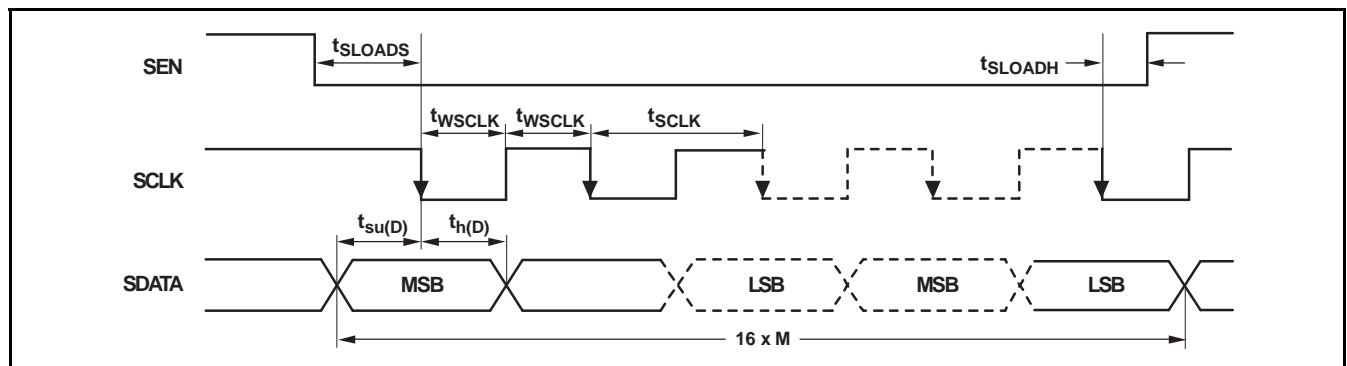

Figure 4. Serial Programming Interface Timing Diagram

Table 1. Serial Programming Interface Timing Characteristics

SYMBOL	PARAMETER	ADS5541			UNIT
		MIN <sup>(1)</sup>	TYP <sup>(1)</sup>	MAX <sup>(1)</sup>	
t <sub>SCLK</sub>	SCLK period	50			ns
t <sub>WSCLK</sub>	SCLK duty cycle	25	50	75	%
t <sub>SLOADS</sub>	SEN to SCLK setup time	8			ns
t <sub>SLOADH</sub>	SCLK to SEN hold time	6			ns
t <sub>S<sub>Y</sub>(D)</sub>	Data setup time	8			ns
t <sub>H(D)</sub>	Data hold time	6			ns

(1) Values are characterized, but not production tested.

**Table 2. Serial Register Table<sup>(1)</sup>**

A3	A2	A1	A0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	DESCRIPTION	
														DLL CTRL		<b>Clock DLL</b>	
1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	Internal DLL is on; recommended for 60MSPS to 105MSPS clock speeds.
1	1	0	1	0	0	0	0	0	0	0	0	0	0	1	0	0	Internal DLL is off; recommended for 2MSPS to 80MSPS clock speeds.
					TP<1>	TP<0>											<b>Test Mode</b>
1	1	1	0	0	0	0	0	0	0	0	0	0	0	X	0	0	Normal mode of operation
1	1	1	0	0	0	1	0	0	0	0	0	0	0	X	0	0	All outputs forced to 0
1	1	1	0	0	1	0	0	0	0	0	0	0	0	X	0	0	All outputs forced to 1
1	1	1	0	0	1	1	0	0	0	0	0	0	0	X	0	0	Each output bit toggles between 0 and 1. <sup>(2)(3)</sup>
					PDN												<b>Power Down</b>
1	1	1	1	0	0	0	0	0	0	0	0	0	0	X	0	0	Normal mode of operation
1	1	1	1	1	0	0	0	0	0	0	0	0	0	X	0	0	Device is put in power-down (low-current) mode.

- (1) The register contents default to the appropriate setting for normal operation up on RESET.
- (2) The patterns given are applicable to the straight offset binary output format. If two's complement output format is selected, the test mode outputs will be the binary two's complement equivalent of these patterns as described in the [Output Information](#) section.
- (3) While each bit toggles between 1 and 0 in this mode, there is no assured phase relationship between the data bits D0–D13. For example, when D0 is a 1, D1 is not assured to be a 0, and vice-versa.

**Table 3. Data Format Select (DFS) Table**

DFS-PIN VOLTAGE ( $V_{DFS}$ )	DATA FORMAT	CLOCK OUTPUT POLARITY
$V_{DFS} < \frac{2}{12} \times AV_{DD}$	Straight Binary	Data valid on rising edge
$\frac{4}{12} \times AV_{DD} < V_{DFS} < \frac{5}{12} \times AV_{DD}$	Two's Complement	Data valid on rising edge
$\frac{7}{12} \times AV_{DD} < V_{DFS} < \frac{8}{12} \times AV_{DD}$	Straight Binary	Data valid on falling edge
$V_{DFS} > \frac{10}{12} \times AV_{DD}$	Two's Complement	Data valid on falling edge

### PIN CONFIGURATION

#### PAP PACKAGE (TOP VIEW)

**PIN CONFIGURATION (continued)**  
**PIN ASSIGNMENTS<sup>(1)</sup>**

TERMINAL		NO. OF PINS	I/O	DESCRIPTION
NAME	NO.			
AV <sub>DD</sub>	5, 7, 9, 15, 22, 24, 26, 28, 33, 34, 37, 39	12	I	Analog power supply
A <sub>GND</sub>	6, 8, 12–14, 16, 18, 21, 23, 25, 27, 32, 36, 38	14	I	Analog ground (PowerPAD must be connected to analog ground).
DRV <sub>DD</sub>	49, 58	2	I	Output driver power supply
DR <sub>GND</sub>	1, 42, 48, 50, 57, 59	6	I	Output driver ground
INP	19	1	I	Differential analog input (positive)
INM	20	1	I	Differential analog input (negative)
REFP	29	1	O	Reference voltage (positive); 1μF capacitor in series with a 1Ω resistor to GND.
REFM	30	1	O	Reference voltage (negative); 1μF capacitor in series with a 1Ω resistor to GND.
IREF	31	1	I	Current set; 56kΩ resistor to GND; do not connect capacitors.
CM	17	1	O	Common-mode output voltage
RESET	35	1	I	Reset (active high); Internal 200kΩ resistor to AV <sub>DD</sub> . <sup>(2)</sup>
OE	41	1	I	Output enable (active high) <sup>(3)</sup>
DFS	40	1	I	Data format and clock out polarity select <sup>(4)(3)</sup>
CLKP	10	1	I	Data converter differential input clock (positive)
CLKM	11	1	I	Data converter differential input clock (negative)
SEN	4	1	I	Serial interface chip select <sup>(3)</sup>
SDATA	3	1	I	Serial interface data <sup>(3)</sup>
SCLK	2	1	I	Serial interface clock <sup>(3)</sup>
D0 (LSB)–D13 (MSB)	44–47, 51–56, 60–63	12	O	Parallel data output
OVR	64	1	O	Over-range indicator bit
CLKOUT	43	1	O	CMOS clock out in sync with data

(1) PowerPAD is connected to analog ground.

(2) If RESET pin is unused, it must be tied to AGND and serial interface should be used to reset the device. See the serial programming interface section for details.

(3) Pins OE, DFS, SEN, SDATA, and SCLK have internal clamping diodes to the DRV<sub>DD</sub> supply. Any external circuit driving these pins must also run off the same supply voltage as DRV<sub>DD</sub>.

(4) [Table 3](#) defines the voltage levels for each mode selectable via the DFS pin.

## DEFINITION OF SPECIFICATIONS

### Analog Bandwidth

The analog input frequency at which the power of the fundamental is reduced by 3dB with respect to the low frequency value.

### Aperture Delay

The delay in time between the falling edge of the input sampling clock and the actual time at which the sampling occurs.

### Aperture Uncertainty (Jitter)

The sample-to-sample variation in aperture delay.

### Clock Pulse Width/Duty Cycle

The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse width) to the period of the clock signal. Duty cycle is typically expressed as a percentage. A perfect differential sine wave clock results in a 50% duty cycle.

### Maximum Conversion Rate

The maximum sampling rate at which certified operation is given. All parametric testing is performed at this sampling rate unless otherwise noted.

### Minimum Conversion Rate

The minimum sampling rate at which the ADC functions.

### Differential Nonlinearity (DNL)

An ideal ADC exhibits code transitions at analog input values spaced exactly 1LSB apart. The DNL is the deviation of any single step from this ideal value, measured in units of LSBs.

### Integral Nonlinearity (INL)

The INL is the deviation of the ADC transfer function from a best fit line determined by a least squares curve fit of that transfer function, measured in units of LSBs.

### Gain Error

The gain error is the deviation of the ADC actual input full-scale range from its ideal value. The gain error is given as a percentage of the ideal input full-scale range. Gain error does not account for variations in the internal reference voltages (see the [Electrical Characteristics](#) section for limits on the variation of  $V_{REFP}$  and  $V_{REFM}$ ).

### Offset Error

The offset error is the difference, given in number of LSBs, between the ADC actual average idle channel output code and the ideal average idle channel output code. This quantity is often mapped into mV.

### Temperature Drift

The temperature drift coefficient (with respect to gain error and offset error) specifies the change per degree Celsius of the parameter from  $T_{MIN}$  to  $T_{MAX}$ . It is calculated by dividing the maximum deviation of the parameter across the  $T_{MIN}$  to  $T_{MAX}$  range by the difference ( $T_{MAX} - T_{MIN}$ ).

### Signal-to-Noise Ratio (SNR)

SNR is the ratio of the power of the fundamental ( $P_S$ ) to the noise floor power ( $P_N$ ), excluding the power at dc and the first eight harmonics.

$$SNR = 10\text{Log}_{10} \frac{P_S}{P_N} \quad (1)$$

SNR is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference or dBFS (dB to Full-Scale) when the power of the fundamental is extrapolated to the converter full-scale range.

### Signal-to-Noise and Distortion (SINAD)

SINAD is the ratio of the power of the fundamental ( $P_S$ ) to the power of all the other spectral components including noise ( $P_N$ ) and distortion ( $P_D$ ), but excluding dc.

$$SINAD = 10\text{Log}_{10} \frac{P_S}{P_N + P_D} \quad (2)$$

SINAD is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter full-scale range.

### Effective Number of Bits (ENOB)

The ENOB is a measure of a converter's performance as compared to the theoretical limit based on quantization noise.

$$ENOB = \frac{SINAD - 1.76}{6.02} \quad (3)$$

### Total Harmonic Distortion (THD)

THD is the ratio of the power of the fundamental ( $P_S$ ) to the power of the first eight harmonics ( $P_D$ ).

$$\text{THD} = 10\text{Log}_{10} \frac{P_S}{P_D} \quad (4)$$

THD is typically given in units of dBc (dB to carrier).

### Spurious-Free Dynamic Range (SFDR)

The ratio of the power of the fundamental to the highest other spectral component (either spur or harmonic). SFDR is typically given in units of dBc (dB to carrier).

### Two-Tone Intermodulation Distortion (IMD3)

IMD3 is the ratio of the power of the fundamental (at frequencies  $f_1$  and  $f_2$ ) to the power of the worst spectral component at either frequency  $2f_1 - f_2$  or  $2f_2 - f_1$ . IMD3 is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to full scale) when the power of the fundamental is extrapolated to the converter full-scale range.

### DC Power-Supply Rejection Ratio (DC PSRR)

The DC PSRR is the ratio of the change in offset error to a change in analog supply voltage. The DC PSRR is typically given in units of mV/V.

### Reference Error

The reference error is the variation of the actual reference voltage ( $V_{REFP} - V_{REFM}$ ) from its ideal value. The reference error is typically given as a percentage.

### Voltage Overload Recovery Time

The voltage overload recovery time is defined as the time required for the ADC to recover to within 1% of the full-scale range in response to an input voltage overload of 10% beyond the full-scale range.

### AC Power-Supply Rejection Ratio (AC PSRR)

The ratio of output spectral power at a given frequency with respect to the injected ac-power on  $AV_{DD}$  at that frequency. The rejected ac-input amplitude should be limited to less than  $100\text{mV}_{PP}$ . The PSRR is typically given in units of dB.

## APPLICATION INFORMATION

### THEORY OF OPERATION

The ADS5541 is a low-power, 14-bit, 105MSPS, CMOS, switched capacitor, pipeline ADC that operates from a single 3.3V supply. The conversion process is initiated by a falling edge of the external input clock. Once the signal is captured by the input S&H, the input sample is sequentially converted by a series of small resolution stages, with the outputs combined in a digital correction logic block. Both the rising and the falling clock edges are used to propagate the sample through the pipeline every half

clock cycle. This process results in a data latency of 17.5 clock cycles, after which the output data is available as a 14-bit parallel word, coded in either straight offset binary or binary two's complement format.

### INPUT CONFIGURATION

The analog input for the ADS5541 consists of a differential sample-and-hold architecture implemented using the switched capacitor technique shown in Figure 39.

NOTE: All Switches are ON in sampling phase, which is approximately one-half of a clock period.

**Figure 39. Analog Input Stage**

This differential input topology produces a high level of ac performance for high sampling rates. It also results in a very high usable input bandwidth, especially important for high intermediate-frequency (IF) or undersampling applications. The ADS5541 requires each of the analog inputs (INP, INM) to be externally biased around the common-mode level of the internal circuitry (CM, pin 17). For a full-scale differential input, each of the differential lines of the input signal (pins 19 and 20) swing symmetrically between  $CM + 0.575V$  and  $CM - 0.575V$ . This means that each input is driven with a signal of up to  $CM \pm 0.575V$ , so that each input has a maximum differential signal of  $1.15V_{PP}$  for a total differential input signal swing of  $2.3V_{PP}$ . The maximum swing is determined by the two reference voltages, the top reference (REFP, pin 29) and the bottom reference (REFM, pin 30).

The ADS5541 gives optimum performance when the analog inputs are driven differentially. The circuit shown in Figure 40 illustrates one possible configuration using an RF transformer.

The single-ended signal is fed to the primary winding of an RF transformer. Placing a  $25\Omega$  resistor in series with INP and INM is recommended to dampen ringing because of ADC kickback. Since the input signal must be biased around the common-mode voltage of the internal circuitry, the common-mode voltage ( $V_{CM}$ ) from the ADS5541 is connected to the center-tap of the secondary winding. To ensure a steady low-noise  $V_{CM}$  reference, best performance is attained when the CM output (pin 17) is filtered to ground with a  $10\Omega$  series resistor and parallel  $0.1\mu F$  and  $0.001\mu F$  low-inductance capacitors as illustrated in Figure 39.

Output  $V_{CM}$  (pin 17) is designed to directly drive the ADC input. When providing a custom CM level, be aware that the input structure of the ADC sinks a common-mode current in the order of  $500\mu A$  ( $250\mu A$  per input) at 105MSPS. Equation 5 describes the dependency of the common-mode current and the sampling frequency:

$$\frac{500\mu A \times f_s \text{ (in MSPS)}}{105 \text{ MSPS}} \quad (5)$$

Where:

$$f_s > 2 \text{ MSPS.}$$

This equation helps to design the output capability and impedance of the driving circuit accordingly.

Figure 40. Transformer Input to Convert Single-Ended Signal to Differential Signal

When it is necessary to buffer or apply a gain to the incoming analog signal, it is possible to combine single-ended operational amplifiers with an RF transformer, or to use a differential input/output amplifier without a transformer, to drive the input of the ADS5541. Texas Instruments offers a wide selection of single-ended operational amplifiers (including the [THS3201](#), [THS3202](#), [OPA847](#), and [OPA695](#)) that can be selected depending on the application. An RF gain block amplifier, such as Texas Instruments [THS9001](#), can also be used with an RF transformer for high input frequency applications. The THS4503 is a recommended differential input/output amplifier. [Table 4](#) lists the recommended amplifiers.

When using single-ended operational amplifiers (such as the [THS3201](#), [THS3202](#), [OPA847](#), or [OPA695](#)) to provide gain, a three-amplifier circuit is recommended with one amplifier driving the primary of an RF transformer and one amplifier in each of the legs of the secondary driving the two differential inputs of the ADS5520. These three amplifier circuits minimize even-order harmonics. For high frequency inputs, an RF gain block amplifier can be used to drive a transformer primary; in this case, the transformer secondary connections can drive the input of the ADS5541 directly, as shown in [Figure 40](#), or with the addition of the filter circuit shown in [Figure 41](#).

[Figure 41](#) illustrates how  $R_{IN}$  and  $C_{IN}$  can be placed to isolate the signal source from the switching inputs of the ADC and to implement a low-pass RC filter to limit the input noise in the ADC. It is recommended that these components be included in the ADS5541 circuit layout when any of the amplifier circuits discussed previously are used. The components allow fine-tuning of the circuit performance. Any mismatch between the differential lines of the ADS5541 input produces a degradation in performance at high input frequencies, mainly characterized by an increase in the even-order harmonics. In this case, special care should be taken to keep as much electrical symmetry as possible between both inputs.

Another possible configuration for lower-frequency signals is the use of differential input/output amplifiers that can simplify the driver circuit for applications requiring dc-coupling of the input. Flexible in their configurations (see [Figure 42](#)), such amplifiers can be used for single-ended-to-differential conversion signal amplification.

**Table 4. Recommended Amplifiers to Drive the Input of the ADS5520**

INPUT SIGNAL FREQUENCY	RECOMMENDED AMPLIFIER	TYPE OF AMPLIFIER	USE WITH TRANSFORMER
DC to 20MHz	<a href="#">THS4503</a>	Differential In/Out Amp	No
DC to 50MHz	<a href="#">OPA847</a>	Operational Amp	Yes
10MHz to 120MHz	<a href="#">OPA695</a>	Operational Amp	Yes
	<a href="#">THS3201</a>	Operational Amp	Yes
	<a href="#">THS3202</a>	Operational Amp	Yes
Over 100MHz	<a href="#">THS9001</a>	RF Gain Block	Yes

**Figure 41. Converting a Single-Ended Input Signal to a Differential Signal Using an RF Transformer**

Figure 42. Using the THS4503 with the ADS5520

**POWER-SUPPLY SEQUENCE**

The preferred mode of power-supply sequencing is to power up AV<sub>DD</sub> first, followed by DRV<sub>DD</sub>. Raising both supplies simultaneously is also a valid power-supply sequence. In the event that DRV<sub>DD</sub> powers up before AV<sub>DD</sub> in the system, AV<sub>DD</sub> must power up within 10ms of DRV<sub>DD</sub>. Optionally, it is recommended to put a 2kΩ resistor from REFP (pin 29) to AV<sub>DD</sub> as shown in Figure 43. This configuration helps to make the device more robust to power supply ramp-up timings.

Figure 43.

**POWER-DOWN**

The device enters power-down in one of two ways: either by reducing the clock speed or by setting the PDN bit via the serial programming interface. Using the reduced clock speed, power-down may be initiated for clock frequency below 2MSPS. The exact frequency at which the power-down occurs varies from device to device.

Using the serial interface PDN bit to power down the device places the outputs in a high-impedance state and only the internal reference remains on to reduce the power-up time. The power-down mode reduces power dissipation to approximately 180mW.

**REFERENCE CIRCUIT**

The ADS5541 has built-in internal reference generation, requiring no external circuitry on the printed circuit board (PCB). For optimum performance, it is best to connect both REFP and REFM to ground with a 1µF decoupling capacitor (the 1Ω resistor shown in Figure 44 is optional). In addition, an external 56kΩ resistor should be connected from IREF (pin 31) to AGND, as shown in Figure 44. No capacitor should be connected between pin 31 and ground; only the 56kΩ resistor should be used.

Figure 44. REFP, REFM, and IREF Connections for Optimum Performance

### CLOCK INPUT

The ADS5541 clock input can be driven with either a differential clock signal or a single-ended clock input, with little or no difference in performance between both configurations. The common-mode voltage of the clock inputs is set internally to CM (pin 17) using internal 5kΩ resistors that connect CLKP (pin 10) and CLKM (pin 11) to CM (pin 17), as shown in Figure 45.

Figure 45. Clock Inputs

When driven with a single-ended CMOS clock input, it is best to connect CLKM (pin 11) to ground with a 0.01μF capacitor, while CLKP is ac-coupled with a 0.01μF capacitor to the clock source, as shown in Figure 46.

Figure 46. AC-Coupled, Single-Ended Clock Input

The ADS5541 clock input can also be driven differentially, reducing susceptibility to common-mode noise. In this case, it is best to connect both clock inputs to the differential input clock signal with 0.01μF capacitors, as shown in Figure 47.

Figure 47. AC-Coupled, Differential Clock Input

For high-input frequency sampling, it is recommended to use a clock source with low jitter. Additionally, the internal ADC core uses both edges of the clock for the conversion process. This means that, ideally, a 50% duty cycle should be provided. Figure 48 shows the performance variation of the ADC versus clock duty cycle.

Figure 48. AC Performance vs Clock Duty Cycle

Bandpass filtering of the source can help produce a 50% duty cycle clock and reduce the effect of jitter. When using a sinusoidal clock, the clock jitter further improves as the amplitude is increased. In that sense, using a differential clock allows for the use of larger amplitudes without exceeding the supply rails and absolute maximum ratings of the ADC clock input. Figure 49 shows the performance variation of the device versus input clock amplitude. For detailed clocking schemes based on transformer or PECL-level clocks, see the ADS5541EVM User's Guide (SLWU010), available for download from [www.ti.com](http://www.ti.com).

Figure 49. AC Performance vs Clock Amplitude

## INTERNAL DLL

In order to achieve the fastest possible sampling rates with the ADS5541, the device uses an internal delay locked loop (DLL). The effective delay range of the DLL limits its use to sampling rates above 60MSPS. In order to operate the device below 60MSPS, the internal DLL must be shut off using the DLL OFF mode described in the [Serial Programming Interface](#) section. The [Typical Characteristics](#) show the performance obtained in both modes of operation: DLL ON (default) and DLL OFF. In either

of the two modes, the device enters power-down mode if no clock or a slow clock is provided. The limit of the clock frequency where the device functions properly with default settings is ensured to be over 2MHz.

## OUTPUT INFORMATION

The ADC provides 14 data outputs (D13 to D0, with D13 being the MSB and D0 the LSB), a data-ready signal (CLKOUT, pin 43), and an out-of-range indicator (OVR, pin 64) that equals '1' when the output reaches the full-scale limits.

Two different output formats (straight offset binary or two's complement) and two different output clock polarities (latching output data on rising or falling edge of the output clock) can be selected by setting DFS (pin 40) to one of four different voltages. Table 3 details the four modes. In addition, output enable control (OE, pin 41, active high) is provided to put the outputs into a high-impedance state.

In the event of an input voltage overdrive, the digital outputs go to the appropriate full-scale level. For a positive overdrive, the output code is 0x3FFF in straight offset binary output format, and 0x1FFF in two's complement output format. For a negative input overdrive, the output code is 0x0000 in straight offset binary output format, and 0x2000 in two's complement output format. These outputs to an overdrive signal are ensured through design and characterization

The output circuitry of the ADS5541, by design, minimizes the noise produced by the data switching transients, and, in particular, its coupling to the ADC analog circuitry. Output D4 (pin 51) senses the load capacitance and adjusts the drive capability of all the output pins of the ADC to maintain the same output slew rate described in the timing diagram of Figure 1. Care should be taken to ensure that all output lines (including CLKOUT) have nearly the same load as D4 (pin 51). This circuit also reduces the sensitivity of the output timing versus supply voltage or temperature. Placing external resistors in series with the outputs is **not** recommended.

The timing characteristics of the digital outputs change for sampling rates below the 105MSPS maximum sampling frequency. Table 5 and Table 6 show the setup, hold, and input clocks to output data delays, and rise and fall times for different sampling frequencies with the DLL on and off, respectively.

Table 7 and Table 8 show the values of various timing parameters for lower sampling frequencies, both with DLL on and off.

To use the input clock as the data capture clock, it is necessary to delay the input clock by a delay,  $t_D$ , that results in the desired setup or hold time. Use either of the following equations to calculate the value of  $t_D$ .

$$\text{Desired setup time} = t_D - t_{\text{START}}$$

$$\text{Desired hold time} = t_{\text{END}} - t_D$$

## SERIAL PROGRAMMING INTERFACE

The ADS5541 has internal registers for the programming of some of the modes described in the previous sections. The registers should be reset after power-up by applying a 2 $\mu$ s (minimum) high pulse on RESET (pin 35); this pulse also resets the entire ADC and sets the data outputs to low. This pin has a 200k $\Omega$  internal pullup resistor to AV<sub>DD</sub>. The programming is done through a three-wire interface.

Table 2 shows the different modes and the bit values to be written to the register to enable them.

Note that some of these modes may modify the standard operation of the device and possibly vary the performance with respect to the typical data shown in this data sheet.

Applying a RESET signal is absolutely essential to set the internal registers to the default states for normal operation. If the hardware RESET function is not used in the system, the RESET pin must be tied to ground, and it is necessary to write the default values to the internal registers through the serial programming interface. The registers must be written in the following order.

Write 9000h (Address 9, Data 000)  
 Write A000h (Address A, Data 000)  
 Write B000h (Address B, Data 000)  
 Write C000h (Address C, Data 000)  
 Write D000h (Address D, Data 000)  
 Write E000h (Address E, Data 804)  
 Write 0000h (Address 0, Data 000)  
 Write 1000h (Address 1, Data 000)  
 Write F000h (Address F, Data 000)

**NOTE:** This procedure is only required if a RESET pulse is not provided to the device.

## PowerPAD PACKAGE

The PowerPAD package is a thermally-enhanced standard size IC package designed to eliminate the use of bulky heatsinks and slugs traditionally used in thermal packages. This package can be easily mounted using standard printed circuit board (PCB) assembly techniques, and can be removed and replaced using standard repair procedures.

The PowerPAD package is designed so that the lead

frame die pad (or thermal pad) is exposed on the bottom of the IC. This provides an extremely low thermal resistance path between the die and the exterior of the package. The thermal pad on the bottom of the IC can then be soldered directly to the PCB, using the PCB as a heatsink.

## Assembly Process

1. Prepare the PCB top-side etch pattern including etch for the leads as well as the thermal pad as illustrated in the *Mechanical Data* section. The recommended thermal pad dimension is 8mm  $\times$  8mm.
2. Place a 5-by-5 array of thermal vias in the thermal pad area. These holes should be 13mils in diameter. The small size prevents wicking of the solder through the holes.
3. It is recommended to place a small number of 25mil diameter holes under the package, but outside the thermal pad area to provide an additional heat path.
4. Connect all holes (both those inside and outside the thermal pad area) to an internal copper plane (such as a ground plane).
5. Do not use the typical web or spoke via connection pattern when connecting the thermal vias to the ground plane. The spoke pattern increases the thermal resistance to the ground plane.
6. The top-side solder mask should leave exposed the terminals of the package and the thermal pad area.
7. Cover the entire bottom side of the PowerPAD vias to prevent solder wicking.
8. Apply solder paste to the exposed thermal pad area and all of the package terminals.

For more detailed information regarding the PowerPAD package and its thermal properties, see either the application brief [SLMA004B](#) (*PowerPAD Made Easy*) or technical brief [SLMA002](#) (*PowerPAD Thermally Enhanced Package*).

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**
**REEL DIMENSIONS**

**TAPE DIMENSIONS**

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

## THERMAL PAD MECHANICAL DATA

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
