

# CDCEL913-Q1

SCAS888-SEPTEMBER 2009

# Programmable 1-PLL VCXO Clock Synthesizer With 1.8-V, 2.5-V, and 3.3-V Outputs

Check for Samples: CDCEL913-Q1

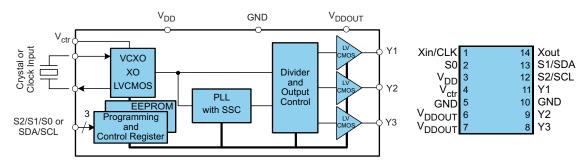

## **FEATURES**

- Qualified for Automotive Applications
- Member of Programmable Clock Generator Family
  - CDCE913/CDCEL913: 1-PLL, 3 Outputs
  - CDCE925/CDCEL925: 2-PLL, 5 Outputs
  - CDCE937/CDCEL937: 3-PLL, 7 Outputs
  - CDCE949/CDCEL949: 4-PLL, 9 Outputs
- In-System Programmability and EEPROM
  - Serial Programmable Volatile Register
  - Nonvolatile EEPROM to Store Customer Setting
- Flexible Input Clocking Concept
  - External Crystal: 8 MHz to 32 MHz
  - On-Chip VCXO: Pull Range ±150 ppm
  - Single-Ended LVCMOS up to 160 MHz
- Free Selectable Output Frequency up to 230 MHz
- Low-Noise PLL Core
  - PLL Loop Filter Components Integrated
  - Low Period Jitter (Typical 50 ps)
- Separate Output Supply Pins
  - CDCE913: 3.3 V and 2.5 V
  - CDCEL913: 1.8 V

- Flexible Clock Driver
  - Three User-Definable Control Inputs [S0/S1/S2], for example., SSC Selection, Frequency Switching, Output Enable, or Power Down
  - Generates Highly Accurate Clocks for Video, Audio, USB, IEEE1394, RFID, Bluetooth™, WLAN, Ethernet™, and GPS
  - Generates Common Clock Frequencies Used With TI- DaVinci™, OMAP™, DSPs
  - Programmable SSC Modulation
  - Enables 0-PPM Clock Generation
- 1.8-V Device Power Supply
- Wide Temperature Range –40°C to 85°C
- Packaged in TSSOP
- Development and Programming Kit for Easy PLL Design and Programming (TI Pro-Clock™)
- Latch-Up Exceeds 100 mA per JESD78B - Class I

## APPLICATIONS

• D-TV, STB, IP-STB, DVD-Player, DVD-Recorder, Printer

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## DESCRIPTION

The CDCE913 and CDCEL913 are modular PLL-based low-cost, high-performance, programmable clock synthesizers, multipliers, and dividers. They generate up to three output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using the integrated configurable PLL.

The CDCx913 has separate output supply pins,  $V_{DDOUT}$ , which is 1.8 V for CDCEL913 and 2.5 V to 3.3 V for CDCE913.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 to 20 pF. Additionally, an on-chip VCXO is selectable which allows synchronization of the output frequency to an external control signal, that is, PWM signal.

The deep M/N divider ratio allows the generation of zero-ppm audio/video, networking (WLAN, BlueTooth, Ethernet, GPS) or interface (USB, IEEE1394, Memory Stick) clocks from, for example, a 27-MHz reference input frequency.

The PLL supports SSC (spread-spectrum clocking). SSC can be center-spread or down-spread clocking which is a common technique to reduce electro-magnetic interference (EMI).

Based on the PLL frequency and the divider settings, the internal loop filter components are automatically adjusted to achieve high stability and optimized jitter transfer characteristic.

The device supports non-volatile EEPROM programming for ease customization of the device to the application. It is preset to a factory default configuration (see the DEFAULT DEVICE CONFIGURATION section). It can be re-programmed to a different application configuration before PCB assembly, or re-programmed by in-system programming. All device settings are programmable through SDA/SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1 and S2, can be used to select different frequencies, or change SSC setting for lowering EMI, or other control features like, outputs disable to low, outputs 3-state, power down, PLL bypass, etc).

The CDCx913 operates in a 1.8-V environment. It operates in a temperature range of -40°C to 85°C.

| T <sub>A</sub> | PACKAGE    |              | ORDERABLE PART NUMBER | TOP-SIDE MARKING |  |  |  |  |
|----------------|------------|--------------|-----------------------|------------------|--|--|--|--|
| –40°C to 85°C  | TSSOP – PW | Reel of 2000 | CDCEL913IPWRQ1        | CEL913Q          |  |  |  |  |

### ORDERING INFORMATION<sup>(1)</sup> <sup>(2)</sup>

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

### SCAS888-SEPTEMBER 2009

## **ABSOLUTE MAXIMUM RATINGS**

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                  |  | VALUE                         | UNIT |
|------------------|--|-------------------------------|------|
| $V_{DD}$         | Supply voltage range                         | -0.5 to 2.5                   | V    |
| VI               | Input voltage range <sup>(2) (3)</sup>       | –0.5 to V <sub>DD</sub> + 0.5 | V    |
| Vo               | Output voltage range <sup>(2)</sup>          | –0.5 to V <sub>DD</sub> + 0.5 | V    |
| l <sub>l</sub>   | Input current ( $V_I < 0$ , $V_I > V_{DD}$ ) | 20                            | mA   |
| I <sub>O</sub>   | Continuous output current                    | 50                            | mA   |
| T <sub>stg</sub> | Storage temperature range                    | -65 to 150                    | °C   |
| TJ               | Maximum junction temperature                 | 125                           | °C   |

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

(3) SDA and SCL can go up to 3.6V as stated in the Recommended Operating Conditions table.

## PACKAGE THERMAL RESISTANCE<sup>(1)</sup> <sup>(2)</sup>

over operating free-air temperature range (unless otherwise noted)

|  | PARAMETER                               | AIRFLOW<br>(Ifm) | TSSOP14<br>°C/W |
|--|---|------------------|-----------------|
|  |   | 0                | 106             |
|  |   | 150              | 93              |
| R <sub>0JA</sub> Thermal resistance, junction to ambient | Thermal resistance, junction to ambient | 200              | 92              |
|  |   | 250              | 90              |
|  |   | 500              | 85              |
| $R_{\theta JC}$  | Thermal resistance, junction to case    | —                | 43              |
| $R_{\theta JB}$  | Thermal resistance, junction to board   | —                | 66              |
| $R_{\theta JT}$  | Thermal resistance, junction to top     | —                | 1.4             |
| $R_{\theta JB}$  | Thermal resistance, junction to bottom  | —                | 62              |

(1) The package thermal impedance is calculated in accordance with JESD 51 and JEDEC2S2P (high-k board).

(2) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

## PARAMETER MEASUREMENT INFORMATION

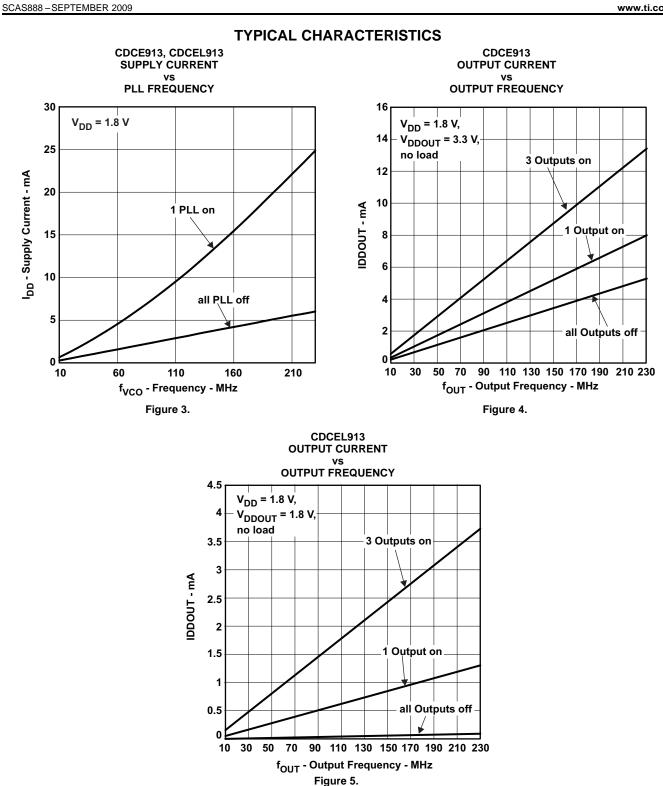

www.ti.com

## **APPLICATION INFORMATION**

## **CONTROL TERMINAL CONFIGURATION**

The CDCE913/CDCEL913 has three user-definable control terminals (S0, S1, and S2) which allow external control of device settings. They can be programmed to any of the following functions:

- Spread spectrum clocking selection  $\rightarrow$  spread type and spread amount selection
- Frequency selection  $\rightarrow$  switching between any of two user-defined frequencies
- Output state selection  $\rightarrow$  output configuration and power down control

The user can predefine up to eight different control settings. Table 1 and Table 2 explain these settings.

#### **Table 1. Control Terminal Definition**

| External Control Bits |                            | PLL1 Setting  |                        | Y1Setting                          |

|    | 0             | State0            |                       |          |  |
|    | 1             | State1            |                       |          |  |
|    |               |                   |                       |          |  |

(1) Center/Down-Spread, Frequency0/1 and State0/1 are user-definable in PLLx Configuration Register;

(2) Frequency0 and Frequency1 can be any frequency within the specified f<sub>VCO</sub> range.

(3) State0/1 selection is valid for both outputs of the corresponding PLL module and can be power down, 3-state, low or active

| Y1 SELECTION |          |  |  |  |  |
|--------------|----------|--|--|--|--|
| Y1           | FUNCTION |  |  |  |  |
| 0            | State 0  |  |  |  |  |
| 1            | State 1  |  |  |  |  |

Table 3. Y1 Setting<sup>(1)</sup>

(1) State0 and State1 are user definable in Generic Configuration Register and can be power down, 3-state, low, or active.

S1/SDA and S2/SCL pins of the CDCE913/CDCEL913 are dual function pins. In default configuration they are defined as SDA/SCL for the serial programming interface. They can be programmed as control-pins (S1/S2) by setting the appropriate bits in the EEPROM. Note that the changes to the Control Register (Bit [6] of Byte 02h) have no effect until they are written into the EEPROM.

Once they are set as control pins, the serial programming interface is no longer available. However, if V<sub>DDOUT</sub> is forced to GND, the two control pins, S1 and S2, temporally act as serial programming pins (SDA/SCL).

S0 is **not** a multi use pin; it is a control pin only.

## DEFAULT DEVICE CONFIGURATION

The internal EEPROM of CDCE913/CDCEL913 is pre-configured with a factory default configuration as shown in Figure 6 (The input frequency is passed through the output as a default). This allows the device to operate in default mode without the extra production step of programming it. The default setting appears after power is supplied or after power-down/up sequence until it is reprogrammed by the user to a different application configuration. A new register setting is programmed via the serial SDA/SCL Interface.

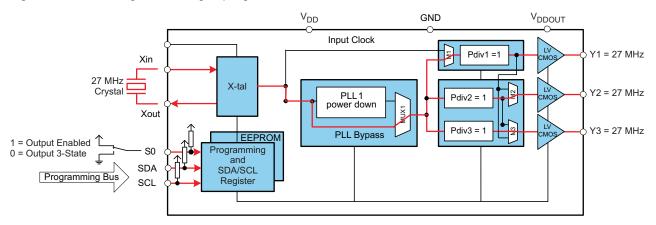

Figure 6. Default Configuration

A different default setting can be programmed upon customer request. Contact Texas Instruments sales or marketing representative for more information.

Table 4 shows the factory default setting for the Control Terminal Register. Note that even though 8 different register settings are possible, in default configuration, only the first two settings (0 and 1) can be selected with S0, as S1 and S2 are configured as programming pins in default mode.

|                       |           |    | Y1               |                     | PLL1 Settings |                  |
|-----------------------|-----------|----|------------------|---------------------|---------------|------------------|
| External Control Pins |           |    | Output Selection | Frequency Selection | SSC Selection | Output Selection |
| S2                    | S1        | S0 | Y1               | FS1                 | SSC1          | Y2Y3             |
| SCL (I2C)             | SDA (I2C) | 0  | 3-state          | f <sub>VCO1_0</sub> | off           | 3-state          |
| SCL (I2C)             | SDA (I2C) | 1  | enabled          | f <sub>VCO1_0</sub> | off           | enabled          |

 Table 4. Factory Default Setting for Control Terminal Register<sup>(1)</sup>

(1) In default mode or when programmed respectively, S1 and S2 act as serial programming interface, SDA/SCL. They do not have any control-pin function but they are internally interpreted as if S1=0 and S2=0. S0, however, is a control-pin which in the default mode switches all outputs ON or OFF (as previously predefined).

## SDA/SCL SERIAL INTERFACE

The CDCE913/CDCEL913 operates as a slave device of the 2-wire serial SDA/SCL bus, compatible with the popular SMBus or I2C specification. It operates in the standard-mode transfer (up to 100kbit/s) and fast-mode transfer (up to 400kbit/s) and supports 7-bit addressing.

The S1/SDA and S2/SCL pins of the CDCE913/CDCEL913 are dual function pins. In the default configuration they are used as SDA/SCL serial programming interface. They can be re-programmed as general purpose control pins, S1 and S2, by changing the corresponding EEPROM setting, Byte **02h**, Bit **[6]**.

## DATA PROTOCOL

The device supports Byte Write and Byte Read and Block Write and Block Read operations.

For Byte Write/Read operations, the system controller can individually access addressed bytes.

For *Block Write/Read* operations, the bytes are accessed in sequential order from lowest to highest byte (with most significant bit first) with the ability to stop after any complete byte has been transferred. The numbers of Bytes read-out are defined by Byte Count in the Generic Configuration Register. At Block Read instruction, all bytes defined in the Byte Count must be readout to correctly finish the read cycle.

Once a byte has been sent, it is written into the internal register and is effective immediately. This applies to each transferred byte regardless of whether this is a *Byte Write* or a *Block Write* sequence.

If the EEPROM Write Cycle is initiated, the internal SDA registers are written into the EEPROM. During this Write Cycle, data is not accepted at the SDA/SCL bus until the write cycle is completed. However, data can be read out during the programming sequence (Byte Read or Block Read). The programming status can be monitored by *EEPIP*, byte 01h–bit 6.

The offset of the indexed byte is encoded in the command code, as described in Table 5.

| DEVICE           | A6 | A5 | A4 | A3 | A2 | A1 <sup>(1)</sup> | A0 <sup>(1)</sup> | R/W |
|------------------|----|----|----|----|----|-------------------|-------------------|-----|
| CDCE913/CDCEL913 | 1  | 1  | 0  | 0  | 1  | 0                 | 1                 | 1/0 |
| CDCE925/CDCEL925 | 1  | 1  | 0  | 0  | 1  | 0                 | 0                 | 1/0 |
| CDCE937/CDCEL937 | 1  | 1  | 0  | 1  | 1  | 0                 | 1                 | 1/0 |
| CDCE949/CDCEL949 | 1  | 1  | 0  | 1  | 1  | 0                 | 0                 | 1/0 |

#### Table 5. Slave Receiver Address (7 Bits)

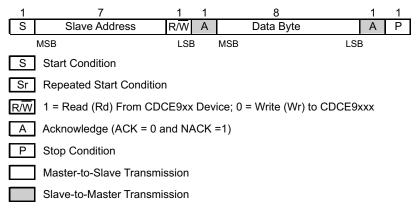

(1) Address bits A0 and A1 are programmable via the SDA/SCL bus (byte **01**, bit [**1:0**]. This allows addressing up to 4 devices connected to the same SDA/SCL bus. The least-significant bit of the address byte designates a write or read operation.

## COMMAND CODE DEFINITION

### Table 6. Command Code Definition

| BIT   | DESCRIPTION  |

## Timing Diagram for the SDA/SCL Serial Control Interface

### SDA/SCL HARDWARE INTERFACE

Figure 13 shows how the CDCE913/CDCEL913 clock synthesizer is connected to the SDA/SCL serial interface bus. Multiple devices can be connected to the bus but the speed may need to be reduced (400 kHz is the maximum) if many devices are connected.

Note that the pullup resistors (R<sub>P</sub>) depends on the supply voltage, bus capacitance, and number of connected devices. The recommended pullup value is 4.7 k $\Omega$ . It must meet the minimum sink current of 3 mA at V<sub>OL</sub>max = 0.4 V for the output stages (for more details see the SMBus or I<sup>2</sup>C<sup>TM</sup> Bus specification).

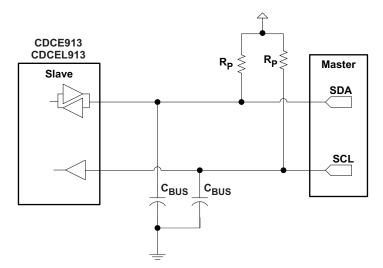

Figure 13. SDA / SCL Hardware Interface

### SDA/SCL CONFIGURATION REGISTERS

The clock input, control pins, PLLs, and output stages are user configurable. The following tables and explanations describe the programmable functions of the CDCE913/CDCEL913. All settings can be manually written into the device via the SDA/SCL bus or easily programmed by using the TI Pro-Clock<sup>™</sup> software. TI Pro-Clock<sup>™</sup> software allows the user to quickly make all settings and automatically calculates the values for optimized performance at lowest jitter.

| - | Table 7 | . SDA/SCL | Registers |  |
|---|---------|-----------|-----------|--|
|   |         |           |           |  |

| Address Offset | Register Description           | Table    |

- (1) Writing data beyond '20h' may affect device function.
- (2) All data transferred with the MSB first.
- (3) Unless customer-specific setting.
- (4) During EEPROM programming, no data is allowed to be sent to the device via the SDA/SCL bus until the programming sequence is completed. Data, however, can be read out during the programming sequence (Byte Read or Block Read).
- (5) If this bit is set to high in the EEPROM, the actual data in the EEPROM is permanently locked. No further programming is possible. Data, however can still be written via SDA/SCL bus to the internal register to change device function on the fly. But new data can no longer be saved to the EEPROM. EELOCK is effective only, if written into the EEPROM.
- (6) Selection of "control pins" is effective only if written into the EEPROM. Once written into the EEPROM, the serial programming pins are no longer available. However, if V<sub>DDOUT</sub> is forced to GND, the two control pins, S1 and S2, temporally act as serial programming pins (SDA/SCL), and the two slave receiver address bits are reset to A0="0" and A1="0".
- (7) These are the bits of the Control Terminal Register (see Table 8). The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2.
- (8) The internal load capacitor (C1, C2) has to be used to achieve the best clock performance. External capacitors should be used only to finely adjust CL by a few picofarads. The value of CL can be programmed with a resolution of 1 pF for a crystal load range of 0 pF to 20 pF. For CL > 20 pF, use additional external capacitors. Also, the value of the device input capacitance has to be considered which always adds 1.5 pF (6 pF//2 pF) to the selected CL. For more information about VCXO configuration and crystal recommendation, see application report SCAA085.

## Table 9. Generic Configuration Register (continued)

| Offset (1) | Bit <sup>(2)</sup> | Acronym | Default (3) | Description  |  |  |  |  |
|------------|--------------------|---------|-------------|--|--|--|--|--|
| 06h        | 7:1                | BCOUNT  | 20h         | 7-Bit Byte Count (defines the number of bytes which will be sent from this device at the next Block Read transfer); all by have to be read out to correctly finish the read cycle. |  |  |  |  |
| 0011       | 0                  | EEWRITE | 0b          | Initiate EEPROM Write Cycle (4) (9)  | 0– no EEPROM write cycle<br>1 – start EEPROM write cycle (internal register are saved to the EEPROM) |  |  |  |
| 07h-0Fh    |                    | _       | 0h          | Unused address range   |  |  |  |  |

(9) The EEPROM WRITE bit must be sent last. This ensures that the content of all internal registers are stored in the EEPROM. The EEWRITE cycle is initiated with the rising edge of the EEWRITE bit. A static level high does not trigger an EEPROM WRITE cycle. The EEWRITE bit has to be reset to low after the programming is completed. The programming status can be monitored by reading out EEPIP. If EELOCK is set to high, no EEPROM programming is possible.

## Table 10. PLL1 Configuration Register

(1) Writing data beyond 20h may adversely affect device function.

(2) All data is transferred MSB-first.

(3) Unless a custom setting is used

(4) The user can predefine up to eight different control settings. In normal device operation, these settings can be selected by the external control pins, S0, S1, and S2.

## Table 10. PLL1 Configuration Register (continued)

## PLL Multiplier/Divider Definition

At a given input frequency ( $f_{IN}$ ), the output frequency ( $f_{OUT}$ ) of the CDCE913/CDCEL913 can be calculated:

$$f_{\text{OUT}} = \frac{f_{\text{IN}}}{\text{Pdiv}} \times \frac{N}{M}$$
(1)

where

M (1 to 511) and N (1 to 4095) are the multiplier/divide values of the PLL; Pdiv (1 to 127) is the output divider.

The target VCO frequency ( $f_{VCO}$ ) of each PLL can be calculated:

$$f_{\rm VCO} = f_{\rm IN} \times \frac{\rm N}{\rm M}$$

The PLL internally operates as fractional divider and needs the following multiplier/divider settings:

• N

• 
$$P = 4 - int \left( \log_2 \frac{N}{M} \right) [if P < 0 \text{ then } P = 0]$$

• 
$$Q = int \left(\frac{M}{M}\right)$$

•  $R = N' - M \times Q$ 

where

N' = N × 2<sup>P</sup>; N ≥ M; 100 MHz <  $f_{VCO}$  > 200 MHz.

## Example:

for  $f_{IN} = 27$  MHz; M = 1; N = 4; Pdiv = 2;for  $f_{IN} = 27$  MHz; M = 2; N = 11; Pdiv = 2; $\rightarrow f_{OUT} = 54$  MHz $\rightarrow f_{OUT} = 74.25$  MHz $\rightarrow f_{VCO} = 108$  MHz $\rightarrow f_{VCO} = 148.50$  MHz $\rightarrow P = 4 - int(log_24) = 4 - 2 = 2$  $\rightarrow P = 4 - int(log_25.5) = 4 - 2 = 2$  $\rightarrow N'' = 4 \times 2^2 = 16$  $\rightarrow N'' = 11 \times 2^2 = 44$  $\rightarrow Q = int(16) = 16$  $\rightarrow Q = int(22) = 22$  $\rightarrow R = 16 - 16 = 0$  $\rightarrow R = 44 - 44 = 0$ 

The values for P, Q, R, and N' are automatically calculated when using TI Pro-Clock™ software.

(2)

## **PACKAGING INFORMATION**

| Orderable Device | Status <sup>(1)</sup> | Package<br>Type | Package<br>Drawing |      | ackage<br>Qty | Eco Plan <sup>(2)</sup>    | Lead/Ball Finish | MSL Peak Temp <sup>(3)</sup> |
|------------------|-----------------------|-----------------|--------------------|------|---------------|----------------------------|------------------|------------------------------|
| CDCEL913IPWRQ1   | ACTIVE                | TSSOP           | PW                 | 14 2 | 2000          | Green (RoHS &<br>no Sb/Br) | CU NIPDAU        | Level-1-260C-UNLIM           |

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE

A. An integration of the information o

Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.

Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.

E. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.

- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
- E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
