

Dual-Channel, 10-/12-Bit, 500-MSPS Digital-to-Analog Converters (DACs)

Check for Samples: [DAC3152](#), [DAC3162](#)

FEATURES

- **Low Power: 270 mW at 500 MSPS**
- **LVDS Input Data Bus**
 - Interleaved DDR Data Load
- **High DC Accuracy: ± 0.25 LSB DNL (10-bit), ± 0.5 LSB INL (12-bit)**
- **Low Latency: 1.5 Clock Cycles**
- **Simple Control: No Software Required**
- **Differential Scalable Output: 2 mA to 20 mA**
- **On-Chip 1.2-V Reference**
- **1.8-V and 3.3-V DC Supplies**
- **Space Saving Package: 48-pin 7-mm x 7-mm QFN**

APPLICATIONS

- Cellular Base Stations
- Wideband Communications
- Medical Instrumentation
- Test and Measurement

FUNCTIONAL BLOCK DIAGRAM

DESCRIPTION

The DAC3152/DAC3162 is a low-power, low-latency, high-dynamic-range, dual-channel, 10-/12-bit, pin-compatible family of digital-to-analog converters (DACs) with a sample rate as high as 500 MSPS.

The device simplicity (no software required), low latency, and low power simplify the design of complex systems. The DACs interface seamlessly with the high-performance TRF370333 analog quadrature modulator for direct upconversion architectures.

Digital data for both DAC channels is interleaved through a single LVDS data bus with on-chip termination. The high input rate of the devices allows the processing of wide-bandwidth signals.

The devices are characterized for operation over the entire industrial temperature range of -40°C to 85°C and are available in a small 48-pin 7-mm x 7-mm QFN package.

The low power, small size, speed, superior crosstalk, simplicity, and low latency of the DAC3152/DAC3162 make them an attractive fit for a variety of applications.

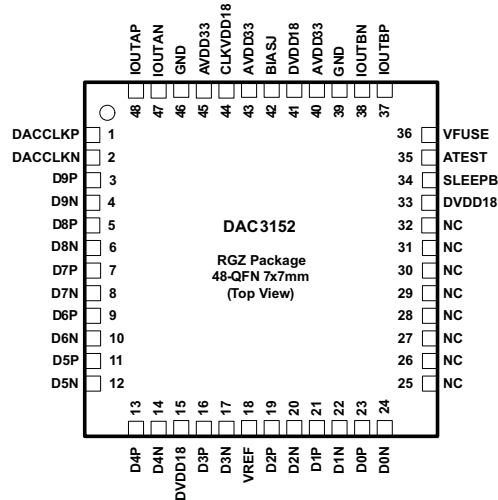

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

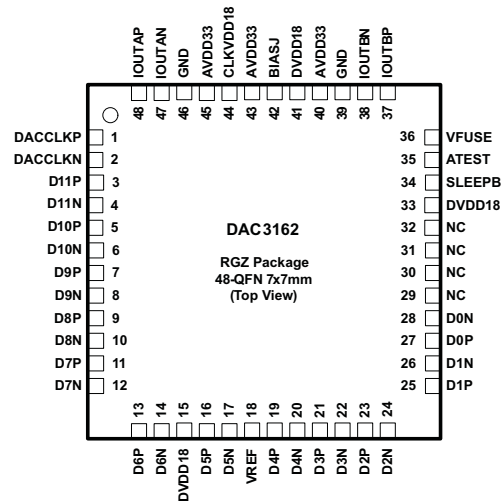

DAC3152 PINOUT AND PIN FUNCTIONS

PIN FUNCTIONS

PIN		I/O	DESCRIPTION
NAME	NO.		
ATEST	35	O	Factory use only. Leave unconnected for normal operation.
AVDD33	40, 43, 45	–	Analog supply voltage (3.3 V)
BIASJ	42	O	Full-scale output current bias. For 20-mA full-scale output current, connect a 960-Ω resistor to GND.
CLKVDD18	44	–	Internal clock buffer supply voltage (1.8 V) This supply can be shared with DIGVDD18.
D[9..0]P	3, 5, 7, 9, 11, 13, 16, 19, 21, 23	I	LVDS positive-input data bits 0 through 9. Each positive/negative LVDS pair has an internal 100-Ω termination resistor. Data format relative to DACCLKP/N clock is double data rate (DDR) with two data transfers per DACCLKP/N clock cycle. Dual-channel data is interleaved on this bus. D9P is most-significant data bit (MSB) – pin 3 D0P is least-significant data bit (LSB) – pin 23
D[9..0]N	4, 6, 8, 10, 12, 14, 17, 20, 22, 24	I	LVDS negative-input data bits 0 through 9. (See D[9:0]P description) D9N is most-significant data bit (MSB) – pin 4 D0N is least-significant data bit (LSB) – pin 24
DACCLKP	1	I	Positive external LVPECL clock input with a self-bias of approximately CLKVDD18/2. Input data is latched on both edges of DACCLKP/N (double data rate). The LVPECL clock signal should be AC coupled.
DACCLKN	2	I	Complementary external LVPECL clock input (see the DACCLKP description). The LVPECL clock signal should be AC coupled.
DVDD18	15, 33, 41	–	Digital supply voltage (1.8 V). This supply can be shared with CLKVDD18.
GND	39, 46, Thermal pad	–	Pins 39 and 46 and the thermal pad located on the bottom of the QFN package are ground for all supplies.
IOUTAP	48	O	A-channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full-scale current sink and the least-positive voltage on the IOUTAP pin. Similarly, a 0x3FF data input results in a 0-mA current sink and the most-positive voltage on the IOUTAP pin.
IOUTAN	47	O	A-channel DAC complementary current output. IOUTAN has the opposite behavior of the IOUTAP described for IOUTAP. An input data value of 0x0000 results in a 0-mA sink and the most-positive voltage on the IOUTAN pin.
IOUTBP	37	O	B-channel DAC current output. See the IOUTAP description.
IOUTBN	38	O	B-channel DAC complementary current output. See the IOUTAN description.
NC	25–32	–	No connect. Leave unconnected for normal operation.
SLEEPB	34	I	Connect to GND to put the device in sleep mode or to AVDD for active mode. Internal pullup
VFUSE	36	–	Digital supply voltage (1.8 V). This supply pin is also used for factory fuse programming. Connect to DVDD18 pins for normal operation.
VREF	18	I/O	Factory use only. Connect to a 0.1-μF decoupling capacitor to GND.

DAC3162 PINOUT AND PIN FUNCTIONS

APPLICATION INFORMATION

DATA INTERFACE

The parallel-port data interface to the device consists of a single LVDS bus that accepts interleaved A and B data with up to 12-bit resolution. Data is sampled by the LVPECL double-data-rate (DDR) clock DACCLK. DACCLK is additionally used for the data conversion process, and hence a low-jitter source is recommended. Setup and hold requirements must be met for proper sampling.

The interleaved data for channels A and B is interleaved in the form A0, B0, A1, B1... into the data bus. Data into the device is formatted according to the diagram shown in [Figure 32](#).

Figure 32. Data Transmission Format

CLOCK INPUT

The DAC clock (DACCLKP/N) is an internally biased differential input that for optimal performance should be driven by a low-jitter clock source. The DACCLK signal is used for both data latching (in DDR format) and as the data conversion clock. Figure 33 shows an equivalent circuit for the DAC input clock.

Figure 33. DACCLKP/N Equivalent Input Circuit

The preferred configuration for driving the DACCLK input consists of a differential ECL/PECL source as shown in Figure 34. Although not optimal due to the limited signal swing, an LVDS source can also be used to drive the clock input with the preferred configuration shown in Figure 35.

Figure 34. Clock Input Configuration LVPECL

Figure 35. Clock Input Configuration LVDS

A single-ended clock, such as a clean sinusoid or a 1.8 V LVCMOS signal (for low-rate operation), can also be used to drive the clock if configured as in the input circuits of [Figure 36](#) and [Figure 37](#).

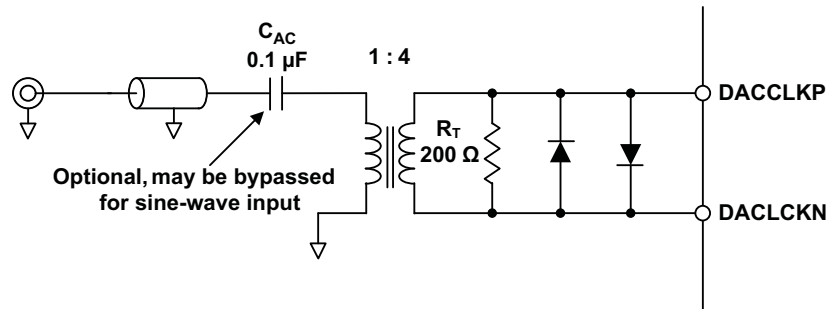

Figure 36. Clock Input Configuration Using 50-Ω Cable Input

Figure 37. Clock Input Configuration With a Single-Ended TTL/CMOS Clock

DATA INPUTS

The input data LVDS pairs (D[11:0]P/N) have the input configuration shown in Figure 38. Figure 39 shows the typical input levels and common-mode voltage used to drive these inputs.

Figure 38. D[13:0]P/N LVDS Input Configuration

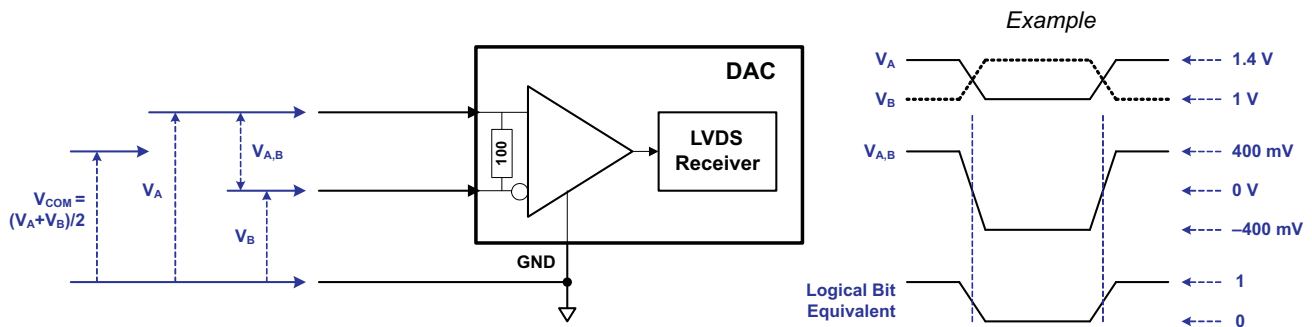

Figure 39. LVDS Data Input Levels

Table 1.

Applied Voltages		Resulting Differential Voltage	Resulting Common-Mode Voltage	Logical Bit Binary Equivalent
V_A	V_B	$V_{A,B}$	V_{COM}	
1.4 V	1 V	400 mV	1.2 V	1
1 V	1.4 V	-400 mV		0
1.2 V	0.8 V	400 mV	1 V	1
0.8 V	1.2 V	-400 mV		0

CMOS INPUT

Figure 40 shows a schematic of the SLEEPB equivalent CMOS digital inputs. See the specification table for logic thresholds. The pullup circuitry is approximately equivalent to 100 kΩ.

Figure 40. SLEEPB Digital Equivalent Input

REFERENCE OPERATION

The DAC3152/DAC3162 uses a band-gap reference and control amplifier for biasing the full-scale output current. The full-scale output current is set by applying an external resistor R_{BIAS} to pin BIASJ. The bias current I_{BIAS} through resistor R_{BIAS} is defined by the on-chip band-gap reference voltage and control amplifier. The default full-scale output current equals 16 times this bias current and can thus be expressed as:

$$I_{OUT_{FS}} = 16 \times I_{BIAS} = 16 \times V_{BG} / R_{BIAS}$$

The band-gap reference voltage delivers an accurate voltage of 1.2 V. The full-scale output current can be adjusted from 20 mA down to 2 mA by varying resistor R_{BIAS} . The internal control amplifier has a wide input range, supporting the full-scale output current range of 20 dB. The recommended value for R_{BIAS} is 960 Ω , which results in a full-scale output current of 20 mA.

DAC TRANSFER FUNCTION

The DAC outputs of the DAC3152/DAC3162 consist of a segmented array of NMOS current sinks, capable of sinking a full-scale output current up to 20 mA. Differential current switches direct the current to either one of the complementary output nodes IOUTP or IOUTN. Complementary output currents enable differential operation, thus canceling out common-mode noise sources (digital feed-through, on-chip and PCB noise), dc offsets, and even-order distortion components, and increasing signal output power by a factor of four.

The full-scale output current is set using external resistor R_{BIAS} in combination with an on-chip band-gap voltage reference source (1.2 V) and control amplifier. Current I_{BIAS} through resistor R_{BIAS} is mirrored internally to provide a maximum full-scale output current equal to 16 times I_{BIAS} .

The relation between IOUTP and IOUTN can be expressed as:

$$I_{OUT_{FS}} = I_{OUTP} + I_{OUTN}$$

Current flowing into a node is denoted as – current, and current flowing out of a node as + current. Because the output stage is a current sink, the current flows from AVDD33 into the IOUTP and IOUTN pins. The output current flow in each pin driving a resistive load can be expressed as:

$$I_{OUTP} = I_{OUT_{FS}} \times ((2^N - 1) - \text{CODE}) / 2^N$$

$$I_{OUTN} = I_{OUT_{FS}} \times \text{CODE} / 2^N$$

where CODE is the decimal representation of the DAC data input word and N is the DAC bit resolution.

For the case where IOUTP and IOUTN drive resistor loads R_L directly, this translates into single-ended voltages at IOUTP and IOUTN:

$$V_{OUTP} = AVDD - |I_{OUTP}| \times R_L$$

$$V_{OUTN} = AVDD - |I_{OUTN}| \times R_L$$

Assuming that the data is full scale ($2^N - 1$ in offset binary notation) and the R_L is 25 Ω , the differential voltage between pins IOUTP and IOUTN can be expressed as:

$$V_{OUTP} = AVDD - | - 0 \text{ mA} | \times 25 \Omega = 3.3 \text{ V}$$

$$V_{OUTN} = AVDD - | -20 \text{ mA} | \times 25 \Omega = 2.8 \text{ V}$$

$$V_{DIFF} = V_{OUTP} - V_{OUTN} = 0.5 \text{ V}$$

Note that care should be taken not to exceed the compliance voltages at nodes IOUTP and IOUTN, which would lead to increased signal distortion.

ANALOG CURRENT OUTPUTS

The DAC outputs can be easily configured to drive a doubly terminated 50-Ω cable using a properly selected RF transformer. Figure 41 and Figure 42 show the 50-Ω doubly terminated transformer configuration with 1:1 and 4:1 impedance ratios, respectively. Note that the center tap of the primary input of the transformer must be connected to AVDD to enable a dc current flow. Applying a 20-mA full-scale output current leads to a 0.5-V_{pp} output for a 1:1 transformer and a 1-V_{pp} output for a 4:1 transformer. The low dc impedance between IOU_{TP} or IOU_{TN} and the transformer center tap sets the center of the ac signal to AVDD, so the 1-V_{pp} output for the 4:1 transformer results in an output between AVDD – 0.5 V and AVDD + 0.5 V.

Figure 41. Driving a Doubly Terminated 50-Ω Cable Using a 1:1 Impedance-Ratio Transformer

Figure 42. Driving a Doubly Terminated 50-Ω Cable Using a 4:1 Impedance-Ratio Transformer

PASSIVE INTERFACE TO ANALOG QUADRATURE MODULATORS

A common application in communication systems is to interface the DAC to an IQ modulator like the TRF3703 family of modulators from Texas Instruments. The input of the modulator is generally of high impedance and requires a specific common-mode voltage. A simple resistive network can be used to maintain 50-Ω load impedance for the DAC3152/DAC3162 and also provide the necessary common-mode RF voltages for both the DAC and the modulator.

Figure 43. DAC3152/DAC3162 to Analog Quadrature Modulator Interface

The DAC3152/DAC3162 has a maximum 20-mA full-scale output and a voltage compliance range of $AVDD \pm 0.5$ V. The TRF3703 IQ modulator family has three common-mode voltage options: 1.5 V, 1.7 V, and 3.3 V, and the TRF370417 IQ modulator has a 1.7-V common mode.

Figure 44 shows the recommended passive network to interface the DAC to the TRF370317, which has a common-mode voltage of 1.7 V. The network generates the 3.3-V common mode required by the DAC output and 1.7 V at the modulator input, while still maintaining a 50-Ω load for the DAC.

Figure 44. DAC3152/DAC3162 to TRF370317 or TRF370417 Interface

If V_1 is set to 5 V and V_2 is set to -5 V, the corresponding resistor values are $R_1 = 57 \Omega$, $R_2 = 80 \Omega$, and $R_3 = 336 \Omega$. The loss developed through R_2 is about -1.86 dB. When there is no -5 -V supply available and V_2 is set to 0 V, the resistor values are $R_1 = 66 \Omega$, $R_2 = 101 \Omega$, and $R_3 = 107 \Omega$. The loss with these values is -5.76 dB.

Figure 45 shows the recommended network for interfacing with the TRF370333, which requires a common mode of 3.3 V. This is the simplest interface, as there is no voltage shift. With $V_1 = 5$ V and $V_2 = 0$ V, the resistor values are $R_1 = 66 \Omega$ and $R_3 = 208 \Omega$.

Figure 45. DAC3152/DAC3162 to TRF370333 Interface

In most applications, a baseband filter is required between the DAC and the modulator to eliminate the DAC images. This filter can be placed after the common-mode biasing network. For the DAC-to-modulator network shown in Figure 46, R2 and the filter load R4 must be considered into the DAC impedance. The filter must be designed for the source impedance created by the resistor combination of $R3 \parallel (R2 + R1)$. The effective impedance seen by the DAC is affected by the filter termination resistor, resulting in $R1 \parallel (R2 + R3 \parallel (R4/2))$.

Figure 46. DAC to Modulator Interface With Filter

Factoring in R4 into the DAC load, a typical interface to the TRF370317 with $V1 = 5\text{ V}$ and $V2 = 0\text{ V}$ results in the following values: $R1 = 72\ \Omega$, $R2 = 116\ \Omega$, $R3 = 124\ \Omega$ and $R4 = 150\ \Omega$. This implies that the filter must be designed for 75- Ω input and output impedance (single-ended impedance). The common-mode levels for the DAC and modulator are maintained at 3.3 V and 1.7 V, and the DAC load is 50 Ω . The added load of the filter termination causes the signal to be attenuated by -10.8 dB.

A filter can be implemented in a similar manner to interface with the TRF370333. In this case, it is much simpler to balance the loads and common-mode voltages, due to the absence of R2. An added benefit is that there is no loss in this network. With $V1 = 5\text{ V}$ and $V2 = 0\text{ V}$, the network can be designed such that $R1 = 115\ \Omega$, $R3 = 681\ \Omega$, and $R4 = 200\ \Omega$. This results in a filter impedance of $R1 \parallel R2 = 100\ \Omega$, and a DAC load of $R1 \parallel R3 \parallel (R4/2)$, which is equal to 50 Ω . R4 is a differential resistor and does not affect the common-mode level created by R1 and R3. The common-mode voltage is set at 3.3 V for a full-scale current of 20 mA.

For more information on how to interface the DAC3152/DAC3162 to an analog quadrature modulator, see the application reports *Passive Terminations for Current Output DACs* (SLAA399) and *Design of Differential Filters for High-Speed Signal Chains* (SLWA053).

POWER-UP SEQUENCE

The following start-up sequence is recommended to power up the DAC3152/DAC3162:

- Supply 1.8 V to DVDD18 and CLKVDD18 simultaneously, and 3.3 V to AVDD33. Within AVDD33, the multiple AVDD33 pins should be powered up simultaneously. The 1.8-V and 3.3-V supplies can be powered up simultaneously or in any order.
There are no specific requirements on the ramp rate for the supplies.
- Provide the DAC clock to the DACCLKP/N inputs.
- Toggle the SLEEPB pin for a minimum 25-ns low pulse duration.
- Provide the LVDS data inputs.

DEFINITION OF SPECIFICATIONS

Adjacent-Carrier Leakage Ratio (ACLR): Defined for a 3.84-Mcps 3GPP W-CDMA input signal measured in a 3.84-MHz bandwidth at a 5-MHz offset from the carrier with a 12-dB peak-to-average ratio.

Analog and Digital Power-Supply Rejection Ratio (APSRR, DPSRR): Defined as the percentage error in the ratio of the delta IOUT and delta supply voltage normalized with respect to the ideal IOUT current.

Differential Nonlinearity (DNL): Defined as the variation in analog output associated with an ideal 1-LSB change in the digital input code.

Gain Drift: Defined as the maximum change in gain, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Gain Error: Defined as the percentage error (in FSR%) for the ratio between the measured full-scale output current and the ideal full-scale output current.

Integral Nonlinearity (INL): Defined as the maximum deviation of the actual analog output from the ideal output, determined by a straight line drawn from zero scale to full scale.

Intermodulation Distortion (IMD3): The two-tone IMD3 is defined as the ratio (in dBc) of the third-order intermodulation distortion product to either fundamental output tone.

Offset Drift: Defined as the maximum change in dc offset, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Offset Error: Defined as the percentage error (in FSR%) for the ratio between the measured mid-scale output current and the ideal mid-scale output current.

Output Compliance Range: Defined as the minimum and maximum allowable voltage at the output of the current-output DAC. Exceeding this limit may result in reduced reliability of the device or adversely affecting distortion performance.

Reference Voltage Drift: Defined as the maximum change of the reference voltage in ppm per degree Celsius from the value at ambient (25°C) to values over the full operating temperature range.

Noise Spectral Density (NSD): Defined as the difference of power (in dBc) between the output tone signal power and the noise floor of 1 Hz bandwidth within the first Nyquist zone, excluding harmonics.

Signal-to-Noise Ratio (SNR): Defined as the ratio of the rms value of the fundamental output signal to the RMS sum of all other spectral components below the Nyquist frequency, including noise, but excluding the first six harmonics and dc.

REVISION HISTORY

Changes from Original (November 2010) to Revision A Page

- Deleted the DAC3172 device 1
-

Changes from Revision A (November 2010) to Revision B Page

- Changed Feature bullet From: High DC Accuracy: ± 1 LSB DNL, ± 2 LSB INL To: High DC Accuracy: ± 0.25 LSB DNL (10-bit), ± 0.5 LSB INL (12-bit) 1
 - Added text "The LVPECL clock signal should be AC coupled" to Pin DACCLKP and DACCLKN descriptions. 2
 - Added text "The LVPECL clock signal should be AC coupled" to Pin DACCLKP and DACCLKN descriptions. 3
 - Added values to the Thermal Information table 4
 - Changed the ELECTRICAL CHARACTERISTICS – DC SPECIFICATION table 5
 - Added Min and Max values to V_{COM} - Internal common mode 6
 - Added Min and Max values to Z_T - Internal termination 6
 - Changed the AC Performance Typical values for DAC3152 and DAC3162 7
 - Added the Typical Characteristics section 8
 - Replaced Signal to Noise Ratio (SNR) with Noise Spectral Density (NSD) 22
-

Changes from Revision B (December 2011) to Revision C Page

- Changed the CLOCK INPUT: DACCLKP/N - Differential voltage MIN value From: 0.4V To: 0.2V for both devices 6
 - Deleted Note 2 From the DIGITAL SPECIFICATIONS table- Driving the clock input with a differential voltage lower than 1 V results in degraded performance. 6
-

Changes from Revision C (February 2012) to Revision D Page

- Added [Figure 31](#) 12
 - Changed [Figure 34](#) 15
 - Added [Figure 35](#) 15
 - Moved the DEFINITION OF SPECIFICATIONS to the end of the data sheet 22
-

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

RGZ (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
