

FULL DIFFERENTIAL ANALOG INPUT 24-BIT, 192-kHz STEREO A/D CONVERTER

Check for Samples: [PCM1804-Q1](#)

FEATURES

- Qualified for Automotive Applications
- AEC-Q100 Test Guidance With the Following Results:
 - Device Temperature Grade 3: –40°C to 85°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level H2
 - Device CDM ESD Classification Level C3B
- 24-Bit Delta-Sigma Stereo A/D Converter
- High Performance:
 - Dynamic Range: 112 dB (Typical)
 - SNR: 111 dB (Typical)
 - THD+N: –102 dB (Typical)
- High-Performance Linear Phase Antialias Digital Filter:
 - Pass-Band Ripple: ±0.005 dB
 - Stop-Band Attenuation: –100 dB
- Fully Differential Analog Input: ±2.5 V
- Audio Interface: Master- or Slave-Mode Selectable
- Data Formats: Left-Justified, I²S, Standard 24-Bit, and DSD
- Function:
 - Peak Detection
 - High-Pass Filter (HPF): –3 dB at 1 Hz, $f_s = 48$ kHz
- Sampling Rate up to 192 kHz
- System Clock: 128 f_s , 256 f_s , 384 f_s , 512 f_s , or 768 f_s

- Dual Power Supplies:
 - 5 V for Analog
 - 3.3 V for Digital
- Power Dissipation: 225 mW
- Small 28-Pin SSOP
- DSD Output: 1 Bit, 64 f_s

APPLICATIONS

- AV Amplifier
- MD Player
- Digital VTR
- Digital Mixer
- Digital Recorder

DESCRIPTION

The PCM1804-Q1 device is a high-performance, single-chip stereo A/D converter with fully differential analog voltage input which uses a precision delta-sigma modulator and includes a linear-phase antialias digital filter and high-pass filter (HPF) that removes DC offset from the input signal. The PCM1804-Q1 device is suitable for a wide variety of mid- to high-grade consumer and professional applications, where excellent performance and 5-V analog supply and 3.3-V digital power-supply operation are required. The PCM1804-Q1 device can achieve both PCM audio and DSD format due to the precision delta-sigma modulator. The PCM1804-Q1 device is fabricated using an advanced CMOS process and is available in a small 28-pin SSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision, Inc.
All other trademarks are the property of their respective owners.

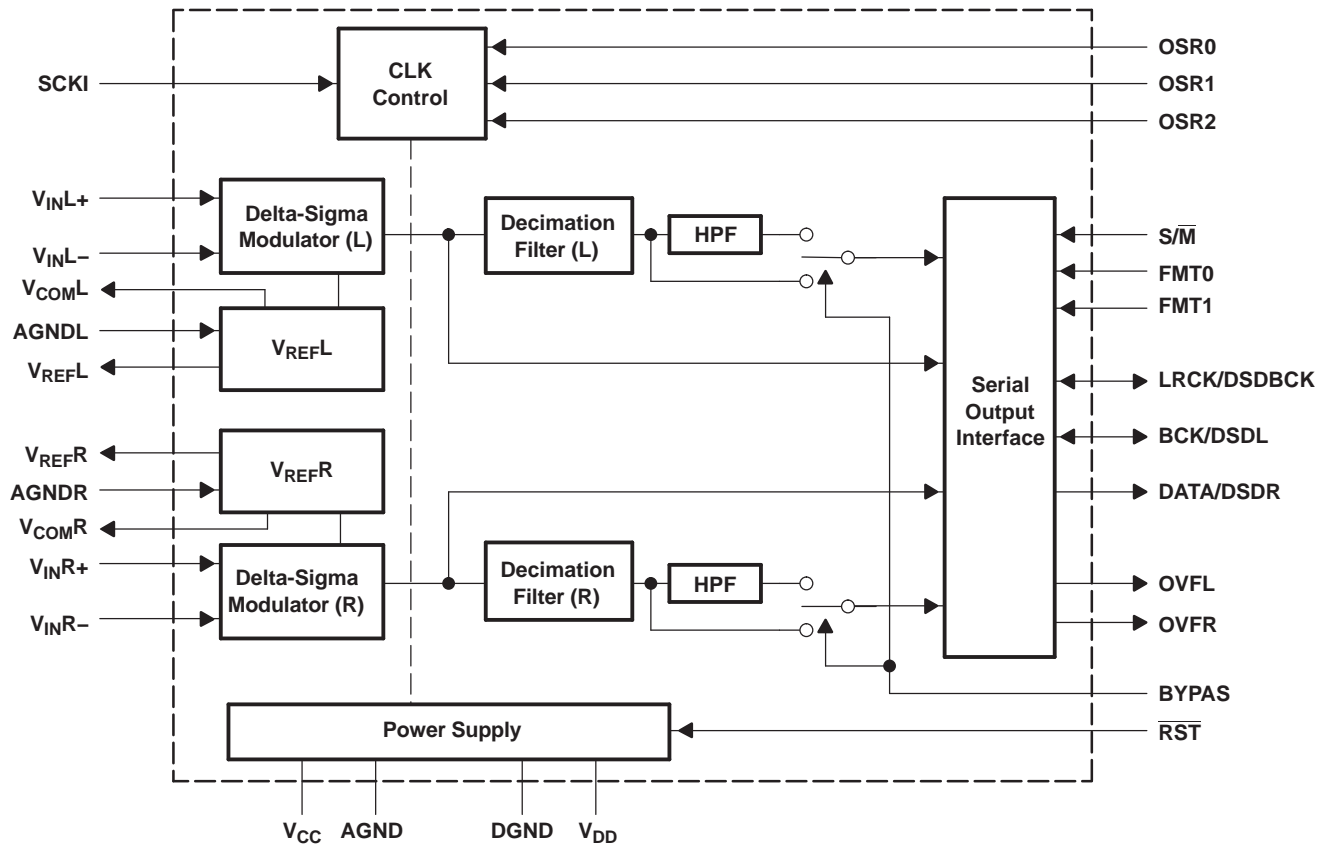

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range

		MIN	NOM	MAX	UNIT
Analog supply voltage, V _{CC} ⁽¹⁾		4.75	5	5.25	V
Digital supply voltage, V _{DD}		3	3.3	3.6	V
Analog input voltage, full-scale (–0 dB), differential input			5		V _{pp}
Digital input logic family		TTL compatible			
Digital input clock frequency	System clock	8.192		36.864	MHz
	Sampling clock	32		192	kHz
Digital output load capacitance				10	pF
Operating free-air temperature, T _A		–10		70	°C

(1) If the V_{CC} drops below the minimum recommended operating condition of 4.75 V, to avoid a brown out condition the V_{CC} power must be cycled to 0 V and then to > 4.75 V to ensure continued device functionality.

ELECTRICAL CHARACTERISTICS

All specifications at $T_A = 25^\circ\text{C}$, $V_{CC} = 5\text{ V}$, $V_{DD} = 3.3\text{ V}$, master mode, single-speed mode, $f_S = 48\text{ kHz}$, system clock = $256 f_S$, 24-bit data, unless otherwise noted.

PRINCIPLES OF OPERATION

THEORY OF OPERATION

The PCM1804-Q1 device consists of a band-gap reference, a delta-sigma modulator with full-differential architecture for L-channel and R-channel, a decimation filter with a high-pass filter, and a serial interface circuit. [Figure 30](#) illustrates the total architecture of the PCM1804-Q1 device. An on-chip, high-precision reference with 10- μ F external capacitor(s) provides all the reference voltage needed in the PCM1804-Q1 device, and it defines the full-scale voltage range of both channels. Full-differential architecture provides a wide dynamic range and excellent power-supply rejection performance. The input signal is sampled at $\times 128$, $\times 64$, and $\times 32$ oversampling rates according to the oversampling ratio control, OSR[0:2]. The single rate, dual rate, and quad rate eliminate the external sample-and-hold amplifier. [Figure 31](#) illustrates how for each oversampling ratio the PCM1804-Q1 device decimates, the modulator outputs down to PCM data when the modulator is running at 6.144 MHz. The delta-sigma modulation randomizes the modulator outputs and reduces the idle-tone level. The oversampled data stream from the delta-sigma modulator is converted to a $1-f_s$, 24-bit digital signal, while removing high-frequency noise components using a decimation filter. The DC components of the signal are removed by the HPF, and the HPF output is converted to a time-multiplexed serial signal through the serial interface, which provides flexible serial formats as well as master and slave modes. The PCM1804-Q1 device also has a DSD output mode. The PCM1804-Q1 device can output the signal directly from the modulators to DSDL (pin 16) and DSDR (pin 15).

PRINCIPLES OF OPERATION (continued)

B0029-01

Figure 30. Total Block Diagram of the PCM1804-Q1 Device

Figure 31. Spectrum of Modulator Output and Decimation Filter

PRINCIPLES OF OPERATION (continued)

SYSTEM CLOCK INPUT

The PCM1804-Q1 device supports $128 f_s$, $192 f_s$ (only in master mode at quad rate), $256 f_s$, $384 f_s$, $512 f_s$, and $768 f_s$ as a system clock, where f_s is the audio sampling frequency. The system clock must be supplied on SCKI (pin 18). Table 3 shows the relationship of typical sampling frequency and the system clock frequency, and Figure 32 shows system clock timing. In master mode, the system clock rate is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in Table 1. In slave mode, the system clock rate is automatically detected. In DSD mode, OSR2 (pin 11), OSR1 (pin 10), OSR0 (pin 9), and the system clock frequency are fixed as shown in Table 1 and Table 3.

PARAMETER		MIN	UNIT
$t_w(SCKH)$	System clock pulse duration, HIGH	11	ns
$t_w(SCKL)$	System clock pulse duration, LOW	11	ns

Figure 32. System Clock Input Timing

POWER-ON AND RESET FUNCTIONS

The PCM1804-Q1 device has both an internal power-on-reset circuit and \overline{RST} (pin 19). For internal power-on reset, initialization (reset) is performed automatically at the time when the digital power supply exceeds 2 V (typical) and analog power supply exceeds 4 V (typical). \overline{RST} accepts external forced reset, and a low level on \overline{RST} initiates the reset sequence. Because an internal pulldown resistor terminates \overline{RST} , no connection of \overline{RST} is equivalent to a low-level input. Because the system clock is used as a clock signal for the reset circuit, the system clock must be supplied as soon as power is supplied; more specifically, at least three system clocks are required prior to $V_{DD} > 2 V$, $V_{CC} > 4 V$, and $RST = high$. While $V_{DD} < 2 V$ (typical), $V_{CC} < 4 V$ (typical), or $RST = low$, and $1 / f_s$ (maximum) count after $V_{DD} > 2 V$ (typical), $V_{CC} > 4 V$ (typical) and $RST = high$, the PCM1804-Q1 device stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of $1116 / f_s$ has passed. Figure 33 and Figure 34 illustrate the internal power-on-reset and external-reset timing, respectively. Figure 35 illustrates the digital output for power-on reset and \overline{RST} control. The PCM1804-Q1 needs $\overline{RST} = low$ when control pins are changed or in slave mode when SCKI, LRCK, and BCK are changed.

POWER-DOWN FUNCTION

The PCM1804-Q1 device has a power-down feature that is controlled by \overline{RST} (pin 19). Entering the power-down mode is done by keeping the \overline{RST} input level low for more than $65536 / f_s$. In the master mode, the SCKI (pin 18) is used as the clock signal for the power-down counter. While in the slave mode, SCKI (pin 18) and LRCK (pin 17) are used as the clock signal. The clock(s) must be supplied until the power-down sequence completes. As soon as \overline{RST} goes high, the PCM1804-Q1 device starts the reset-release sequence described in the Power-On and Reset Functions section.

OVERSAMPLING RATIO

The oversampling ratio is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in Table 1 and Table 2. The PCM1804-Q1 device needs \overline{RST} to equal low when logic levels on the OSR2, OSR1, and OSR0 pins are changed.

Table 1. Oversampling Ratio in Master Mode

OSR2	OSR1	OSR0	OVERSAMPLING RATIO	SYSTEM CLOCK RATE
Low	Low	Low	Single rate ($\times 128 f_S$)	$768 f_S$

Figure 34. External-Reset Timing

T0051-01

- (1) In the DSD mode, DSDL is also controlled like DSDR.
- (2) The HPF transient response appears initially.

Figure 35. ADC Digital Output for Power-On-Reset and $\overline{\text{RST}}$ Control

AUDIO DATA INTERFACE

The PCM1804-Q1 device interfaces the audio system through BCK/DSDL (pin 16), LRCK/DSDBCK (pin 17), and DATA/DSDR (pin 15). The PCM1804-Q1 device needs $\overline{\text{RST}}$ to equal low in the interface mode and/or if the data format is changed.

INTERFACE MODE

The PCM1804-Q1 device supports master mode and slave mode as interface modes, which are selected by $\overline{\text{S/M}}$ (pin 8) as shown in [Table 4](#). In master mode, the PCM1804-Q1 device provides the timing of the serial audio data communications between the PCM1804-Q1 device and the digital audio processor or external circuit. While in slave mode, the PCM1804-Q1 device receives the timing for data transfer from an external controller. Slave mode is not available for DSD.

Table 4. Interface Mode

$\overline{\text{S/M}}$	MODE
Low	Master mode
High	Slave mode

DATA FORMAT

The PCM1804-Q1 device supports four audio data formats in both master and slave modes, and these data formats are selected by FMT0 (pin 6) and FMT1 (pin 7) as shown in [Table 5](#).

Table 5. Data Format

FMT1	FMT0	FORMAT	MASTER	SLAVE
Low	Low	PCM, left-justified, 24-bit	Yes	Yes
Low	High	PCM, I ² S, 24-bit	Yes	Yes
High	Low	PCM, standard, 24-bit	Yes	Yes
High	High	DSD	Yes	–

INTERFACE TIMING FOR PCM

Figure 36 through Figure 38 show the interface timing for PCM.

(1) Left-Justified Data Format; L-Channel = High, R-Channel = Low

(2) I²S Data Format; L-Channel = Low, R-Channel = High

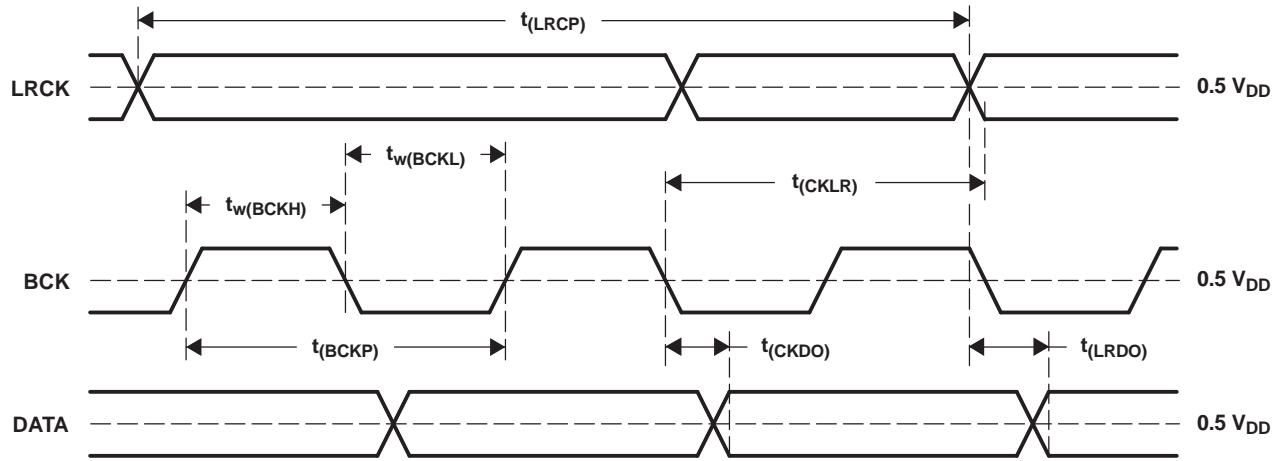

(3) Standard Data Format; L-Channel = High, R-Channel = Low

T0009-03

NOTE: LRCK and BCK work as outputs in master mode and as inputs in slave mode.

Figure 36. Audio Data Format for PCM

T0018-03

PARAMETERS		MIN	TYP	MAX	UNIT
$t_{(BCKP)}$	BCK period		$1 / (64 f_S)$

- (2) The load capacitance of the DSD BCK, DSDL, and DSDR signal is 10 pF.

Figure 40. Audio Data Interface Timing for DSD (Master Mode Only)

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM FOR PCM

In slave mode, the PCM1804-Q1 device operates under LRCK synchronized with the system clock SCKI. The PCM1804-Q1 device does not need a specific phase relationship between LRCK and SCKI, but it does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than ± 6 BCK during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within $1 / f_s$ and digital output is forced into BPZ code until resynchronization between LRCK and SCKI is completed.

For changes less than ± 5 BCK, resynchronization does not occur and the previously described digital output control and discontinuity do not occur.

Figure 41 shows the ADC digital output for loss of synchronization and resynchronization. During undefined data, the PCM1804-Q1 device may generate some noise in the audio signal. Also, the transition of normal to undefined data and undefined or zero data to normal causes a discontinuity of data on the digital output. This can generate noise in the audio signal. In master mode, synchronization loss never occurs.

HIGH-PASS FILTER (HPF) BYPASS CONTROL FOR PCM

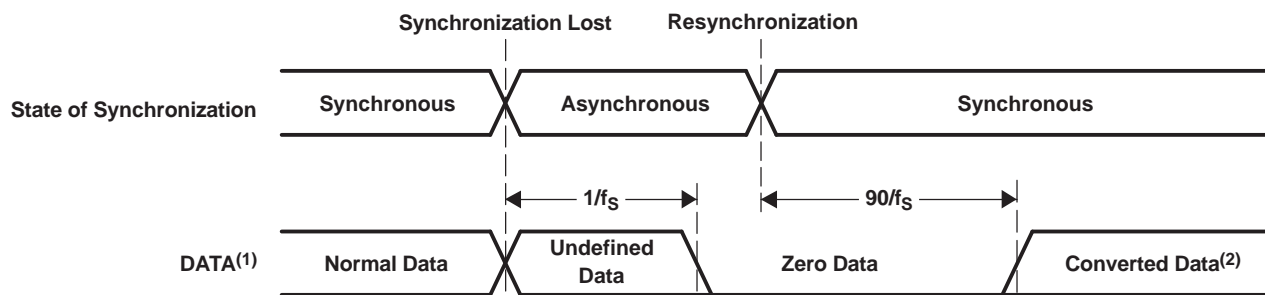

The built-in function for DC component rejection can be bypassed by the BYPAS (pin 12) control. In bypass mode, the DC component of the input analog signal and the internal DC offset are also converted and output in the digital output data.

Table 6. HPF Bypass Control

BYPAS PIN	HPF MODE
Low	Normal (high-pass) mode
High	Bypass (through) mode

OVERFLOW FLAG FOR PCM

The PCM1804-Q1 device has two overflow flag pins, OVFR (pin 20) and OVFL (pin 21). The pins go to high as soon as the analog input goes across the full-scale range. The high level is held for 1.016 s at maximum, and returns to low if the analog input does not go across the full-scale range for the period.

T0020-06

- (1) Applies only for slave mode; the loss of synchronization never occurs in master mode.
- (2) The HPF transient response appears initially.

Figure 41. ADC Digital Output for Loss of Synchronization and Resynchronization

TYPICAL CIRCUIT CONNECTION DIAGRAM

Figure 42 shows a typical circuit connection diagram in the PCM data format operation.

Figure 43. Typical Circuit Connection Diagram for DSD

APPLICATION INFORMATION

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC} and V_{DD} Pins

The digital and analog power supply lines to the PCM1804-Q1 device should be bypassed to the corresponding ground pins with 0.1- μ F ceramic and 10- μ F tantalum capacitors placed as close to the pins as possible to maximize the dynamic performance of the ADC. Although the PCM1804-Q1 device has two power lines to maximize the potential of dynamic performance, using one common power supply is recommended to avoid unexpected power-supply trouble like latch-up or the power-supply sequence.

V_{IN} Pins

Using 0.01- μ F film capacitors between the left-channel analog input positive pin and left-channel analog input negative pin, and between right-channel analog input positive pin and right-channel analog input negative pin is strongly recommended to remove higher-frequency noise from the delta-sigma input section.

V_{REFX} and V_{COMX} Inputs

Use 0.1- μ F ceramic and 10- μ F tantalum capacitors between the left-channel voltage reference output, right-channel voltage reference output, and corresponding analog ground pins, to ensure low source impedance at ADC references. Use 0.1- μ F tantalum capacitors between left-channel analog common-mode voltage, right-channel analog common-mode voltage and corresponding analog ground pins to ensure low source impedance of common voltage. These capacitors should be located as close as possible to the left-channel voltage reference output, right-channel voltage reference output, left-channel analog common-mode voltage, and right-channel analog common-mode voltage pins to reduce dynamic errors on references and common voltage. The DC voltage level of these pins is 2.5 V.

DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK Pins

The DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK pins in master mode have large load drive capability. Locating the buffer near the PCM1804-Q1 device and minimizing the load capacitance, minimizes the digital-analog crosstalk and maximizes the dynamic performance of the ADC.

System Clock

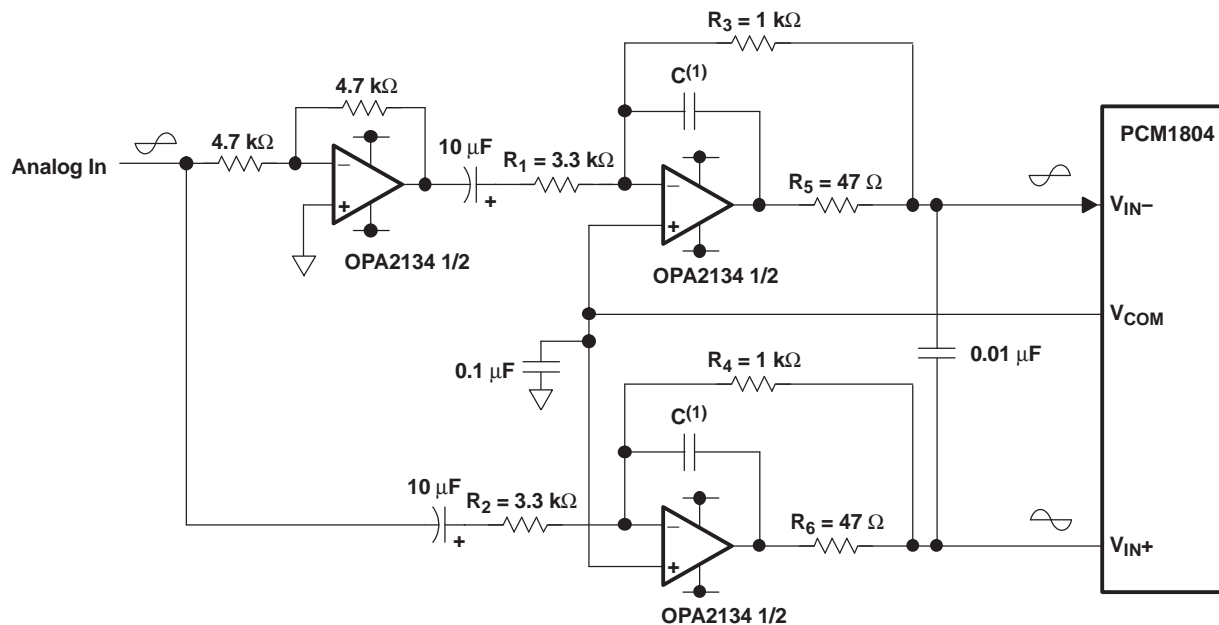

The quality of the system clock can influence dynamic performance because the PCM1804-Q1 device operates based on a system clock. Therefore, it might be necessary to consider the system clock duty, jitter, and the time difference between system clock transition and BCK/DSDL or LRCK/DSDBCK transition in slave mode.

Reset Control

If capacitors larger than 10 μ F are used on left-channel voltage reference output and right-channel voltage reference output, an external reset control with a delay time corresponding to the left-channel voltage reference output and right-channel voltage reference output response is required. Also, it works as a power-down control.

APPLICATION CIRCUIT FOR SINGLE-ENDED INPUT

An application diagram for a single-ended input circuit is shown in [Figure 44](#). The maximum signal input voltage and differential gain of this circuit is designed as $V_{in(max)} = 8.28 V_{pp}$, $A_d = 0.3$. Differential gain (A_d) is given by $R_3 / R_1(R_4 / R_2)$ in a circuit configured as a normal inverted-gain amplifier. Resistor R5 (R6) in the feedback loop gives low-impedance drive operation and noise filtering for the analog input of the PCM1804-Q1 device. The circuit technique using R5 (R6) is recommended.

S0059-01

- (1) A capacitor value of 1800 pF is recommended, unless an input signal greater than -6 dBFS at 100 kHz or higher is applied in the DSD mode. In that case, 3300 pF is recommended.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
