ControlNet™ TRANSCEIVER

Check for Samples: SN65HVD61

FEATURES

- **Compatible With the ControlNet Standard**
- **I/O Operates From 2.5-V to 5-V Supply**
- **Receiver thresholds within –120mV to 120mV**
- **Receiver hysteresis >50mV**
- **Low Power Standby Mode**
- **Thermal Shutdown Protection**
- **Power-Up/Down Glitch-free Bus Inputs and Outputs**
- **Short-Circuit Protection on Outputs**
- **RoHS Compliant**
- **ControlNet Vendor ID 806**

DESCRIPTION

The SN65HVD61 is designed to meet the requirements for the driver and receiver circuitry of the ControlNet coaxial-based physical layer.

These devices are single-channel circuits with one transceiver for single node operation or distributed stand-alone applications.

The pull-or-pull transmitter circuit is designed to sink current from a center-tapped transformer, providing galvanic isolation from the shared bus.

These devices incorporate a differential receiver (RX) with the 120 mV sensitivity needed by ControlNet industrial applications.

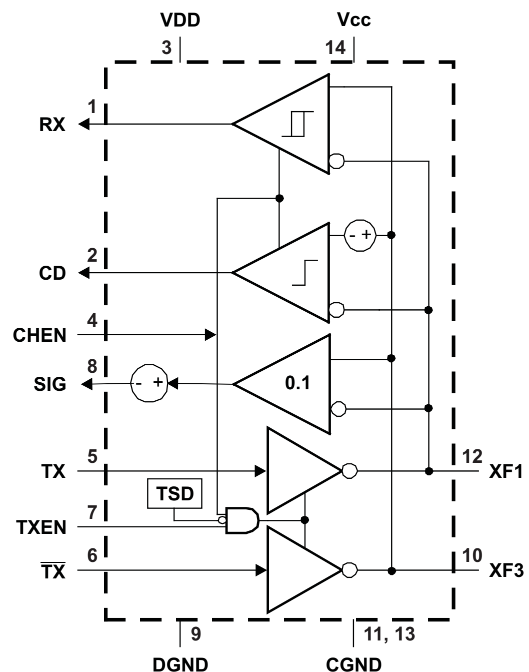
A secondary receiver (CD) detects the presence of a valid positive differential signal.

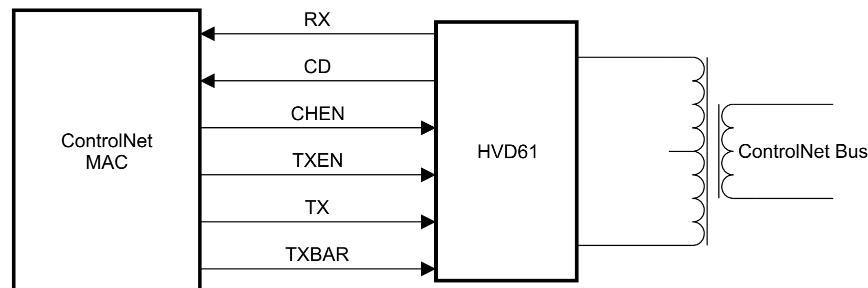
The third signal receiver function (SIG) provides a scaled analog output which is proportional to the differential voltage between XF1 and XF3. This output can be used for diagnostic purposes.

APPLICATIONS

- **Industrial Networks**
- **Programmable Controllers**
- **Industrial Drives**

FUNCTIONAL DIAGRAM





Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ControlNet is a trademark of ODVA.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2007–2011, Texas Instruments Incorporated

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

PART NUMBER	PACKAGE (1)	MARKED AS
SN65HVD61	D	65HVD61
	DR (2)	

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.
(2) R suffix indicates tape and reel

ABSOLUTE MAXIMUM RATINGS (1)

				VALUE	UNIT
V_{CC}	Supply voltage (2) (3)			–0.3 to 6	V
V_{DD}	Supply voltage (4)			–0.3 to 6	V
	Logic input voltage range (TX, TXBAR , TXEN, CHEN)			–0.5 to 6	V
	Bus terminal voltage range (XF1, XF3)			–22 to +22	V
	Logic input current, (TX, TXBAR , TXEN, CHEN)			–20 to 20	mA
	Bus terminal current (XF1, XF3)			Internally limited	
	Receiver output current (RX, CD)			±15	mA
	Electrostatic discharge	Human Body Model (4)	Bus pins (XF1, XF3)	16	kV
			All other pins	4	kV
		Charged Device Model (5)	All pins	1500	V
		Machine Model (6)		200	V
T_J	Junction temperature (see (7) below regarding thermal shutdown)			170	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) DGND and CGND should be connected to a common ground plane external to the device. All voltage values, except differential I/O bus voltages, are with respect to the ground plane
(3) V_{CC} and V_{DD} lower limits are DC conditions, see application information regarding start-up transients.
(4) Tested in accordance JEDEC Standard 22, Test Method A114-A.
(5) Tested in accordance JEDEC Standard 22, Test Method C101.
(6) Tested in accordance JEDEC Standard 22, Test Method A115-A.
(7) If the internal junction temperature exceeds 170°C, a thermal shutdown function will disable the transmitter.

DISSIPATION RATINGS

CIRCUIT BOARD MODEL (1)	$T_A \le 25°C$	DERATING FACTOR (2) ABOVE $T_A = 25°C$	$T_A = 65°C$	$T_A = 100°C$
Low-K	625 mW	5 mW/°C	425 mW	250 mW
High-K	1180 mW	9.5 mW/°C	800 mW	475 mW

(1) Tested in accordance with the Low-K or High-K thermal metric definitions of EIA/JESD51-3 for leaded surface mount packages. For additional information about JEDEC thermal models, see Texas Instruments Application Note *Thermal Characteristics of Logic and Linear Packages using JEDEC PCB Designs* (SZZA017).
(2) This is the inverse of the junction-to-ambient thermal resistance when board-mounted and with no air flow.

RECOMMENDED OPERATING CONDITIONS

			MIN	NOM	MAX	UNIT
V_{CC}	Analog supply voltage(1)		4.5	5	5.5	V
V_{DD}	Input/Output supply voltage(2)		2.375		5.5	V
V_{IH}	High-level logic input voltage	TX, TXBAR, TXEN, CHEN	0.7×VDD		VDD	V
V_{IL}	Low-level logic input voltage		0		0.3×VDD	
	Bus pin common-mode voltage	(VXF1 + VXF3) / 2	4.5		5.5	V
	Voltage at any bus terminal (XF1, XF3)		–10		15	V
	Transmitter peak output current (XF1, XF3)			130	150	mA
I_{OH}	High-level logic output current	RX, CD	–8			mA
I_{OL}	Low-level logic output current				8	
	Output current	SIG	–1		1	mA
T_A	Operating free-air temperature	4.75 V ≤ V_{CC} ≤ 5.25 V	–40		100	°C
		4.5 V ≤ V_{CC} ≤ 5.5 V	–30		100	
T_J	Junction temperature				150	
	Signaling rate			10		Mbps
	Relative humidity (non-condensing)				95%	

(1) A power-shutdown feature keeps the device disabled when the voltage at V_{CC} is below 2.1 V.
(2) The I/O ring voltage for this device (V_{DD}) should be the same as the power supply voltage for the controller with which it interfaces. In the case where the voltages are different, designers must consider the logic threshold compatibility between devices.

ELECTRICAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP[(1)]	MAX	UNIT
BUS PINS (XF1, XF3)						
$V_{OL(TX)}$	Transmitter output low voltage	Connect to V_{CC} through 37.5 Ω, ±1% resistor		0.9	1.2	V
$V_{OH(TX)}$	Transmitter output high voltage		V_{CC}–0.05	V_{CC}		
$V_{O(OFF)}$	Transmitter off noise level, |XF3-XF1|	R_L = 37.5 Ω, 0 to 20 MHz BW, TX and TXBAR inputs idle, CHEN and TXEN inputs LO			5	mV
$V_{SW(PP)}$	Receiver-to-bus reflection, peak-to-peak	R1=R2=50 Ω, C1=C2=15pF, See Figure 3			200	mV
V_{TH+}	Positive-going differential input threshold voltage	4.5V < Vcm < 5.5V		35	120	mV
V_{TH-}	Negative-going differential input threshold voltage	4.5V < Vcm < 5.5V	–120	–35		mV
V_{hys}	Hysteresis voltage (V_{TH+} – V_{TH-})	4.5V < Vcm < 5.5V, RX output	50	70		mV
V_{CD}	Carrier detect threshold voltage, (XF3–XF1)	4.5V < Vcm < 5.5V	23	175	255	mV
I_I	Bus terminal input leakage current	V_I = 10V, TXEN at 0V, Other input at –10V to 10V			1.2	mA
		V_I = –10V, TXEN at 0V Other input at –10V to 10V	–1.7			
$I_{I(off)}$	Bus terminal input leakage current	V_{CC} < 2V, V_I = -10V to 10V Other input at –10 V to 10 V	–1.7		1.2	mA
I_{OS}	Short-circuit output current	0 < V_O < V_{CC}	–400		400	mA
R_{IN}	Bus terminal input resistance	V_I = –10V to 10V, Other input at CGND, DC	12			kΩ
C_{IN}	Differential input capacitance (XF1-to-XF3)	10 MHz AC test frequency, 1V_{PP} amplitude using HP4194A or equivalent impedance analyzer, V_{CC} = 0V		7	11	pF
LOGIC INPUTS (TX, TXBAR, TXEN,CHEN)						
I_I	Logic input current	TX, TXBAR, TXEN, CHEN	–100		100	µA
$I_{I(off)}$	Logic input power-off current	V_{DD} at 0 V, TX,TXBAR, TXEN, CHEN		–100	100	µA
LOGIC OUTPUTS (RX, CD)						
V_{OH}	Logic output voltage, high level	C_L = 15 pF	0.8×V_{DD}			V
		I_O = –4 mA, V_{DD} > 3V	2.4			
V_{OL}	Logic output voltage, low level	C_L = 15 pF			0.2×V_{DD}	V
		I_O = 4 mA			0.4	
I_{OZ}	Logic output high-impedance-state current	RX, CD, 0 < V_O < V_{DD}	–20		20	µA
$I_{O(off)}$	Logic output power-off current	V_{DD} at 0 V, 0 < V_O < 5.5V	–1		1	mA
SIGNAL STRENGTH PIN (SIG)						
$V_{SIG(0)}$	SIG output voltage with zero differential input voltage	R_L = 5 kΩ	1.125	1.25	1.375	V
GAIN	SIG gain $\Delta V_O/\Delta V_{ID}$	V_{ID} switching at 10 Mbps, V_O measured with 20 MHz bandwidth, See Figure 10; 4.75V ≤ V_{CC} ≤ 5.25V			120	mV/V
		4.5V ≤ V_{CC} ≤ 5.5V			140	
POWER SUPPLY PINS (V_{CC}, CGND, VDD, DGND)						
I_{CC}	Analog supply current (dynamic)	CHEN and TXEN at logic high, No load		36	65	mA
	Analog supply current, chip disabled	CHEN at logic low		1.8	3	
	Analog supply current, Lowest power conditions	CHEN at DGND, TX and TXBAR at V_{DD}		0.8	2	
I_{DD}	I/O supply current, I/O, dynamic	CHEN at logic high, no load			5	mA
	I/O supply current, I/O, chip disabled	CHEN at logic low			105	µA

(1) All typical values are at 25°C and with a 5 V supply. For typical values with a 3.3V supply, refer to the TYPICAL CHARACTERISTICS curves.

APPLICATION INFORMATION

THERMAL SHUTDOWN

In most cases, the device's internal junction temperature will not reach the thermal shutdown temperature if operated within the recommended operating conditions. However, during fault conditions, such as driver short-circuit, the junction temperature may reach the thermal shutdown limit. This also depends on the thermal characteristics of the device mounting, the circuit board, and environmental factors. After the device reaches the thermal shutdown temperature, the driver outputs will be disabled, and the device will cool down. If the short-circuit is still present when the drivers are re-enabled, this *thermal shutdown cycle* will repeat until the short-circuit fault is removed.

For long-term reliability, the package power dissipation must not exceed the values in the data sheet POWER DISSIPATION RATINGS for extended periods.

POWER-UP TRANSIENTS

The absolute maximum ratings for Vcc and Vdd specify the limits for these supplies. During initial power-on, these supply voltages may instantaneously drop below the given lower limit. Designers should consider that diodes in the circuitry will begin to turn on if the voltage becomes too negative, and that damage may occur if these diodes dissipate significant power internal to the device. The actual threshold for possible damage is a function of both undervoltage magnitude and undervoltage transient duration. Further, the allowable undervoltage transient conditions depend on factors such as device junction temperature and power supply source impedance.

THERMAL CHARACTERISTICS OF IC PACKAGES

Junction-to-Ambient Thermal Resistance (θ_{JA}) is defined as the difference in junction temperature to ambient temperature divided by the operating power. θ_{JA} is NOT a constant and is a strong function of

- the PCB design (50% variation)
- altitude (20% variation)
- device power (5% variation)

θ_{JA} can be used to compare the thermal performance of packages if the specific test conditions are defined and used. Standardized testing includes specification of PCB construction, test chamber volume, sensor locations, and the thermal characteristics of holding fixtures. θ_{JA} is often misused when it is used to calculate junction temperatures for other installations.

TI uses two test PCBs as defined by JEDEC specifications. The low-k board gives average in-use condition thermal performance and consists of a single trace layer 25 mm long and 2-oz thick copper. The high-k board gives best case in-use condition and consists of 2 1-oz buried power planes with a single trace layer 25 mm long with 2-oz thick copper. A 4% to 50% difference in θ_{JA} can be measured between these two test cards

Junction-to-case thermal resistance (θ_{JC}) is defined as difference in junction temperature to case divided by the operating power. It is measured by putting the mounted package up against a copper block cold plate to force heat to flow from die, through the mold compound into the copper block.

θ_{JC} is a useful thermal characteristic when a heatsink is applied to package. It is NOT a useful characteristic to predict junction temperature as it provides pessimistic numbers if the case temperature is measured in a non-standard system and junction temperatures are backed out. It can be used with θ_{JB} in 1-dimensional thermal simulation of a package system.

Junction-to-board thermal resistance (θ_{JB}) is defined to be the difference in the junction temperature and the PCB temperature at the center of the package (closest to the die) when the PCB is clamped in a cold−plate structure. θ_{JB} is only defined for the high-k test card.

Copyright © 2007–2011, Texas Instruments Incorporated

θ_{JB} provides an overall thermal resistance between the die and the PCB. It includes a bit of the PCB thermal resistance (especially for BGA's with thermal balls) and can be used for simple 1-dimensional network analysis of package system.

	JEDEC High-K Model	JEDEC Low-K Model
θ_{JA}	105.7°C/W	199.5°C/W
θ_{JB}	52.3	52.3
θ_{JC}	56.32°C/W	56.32°C/W

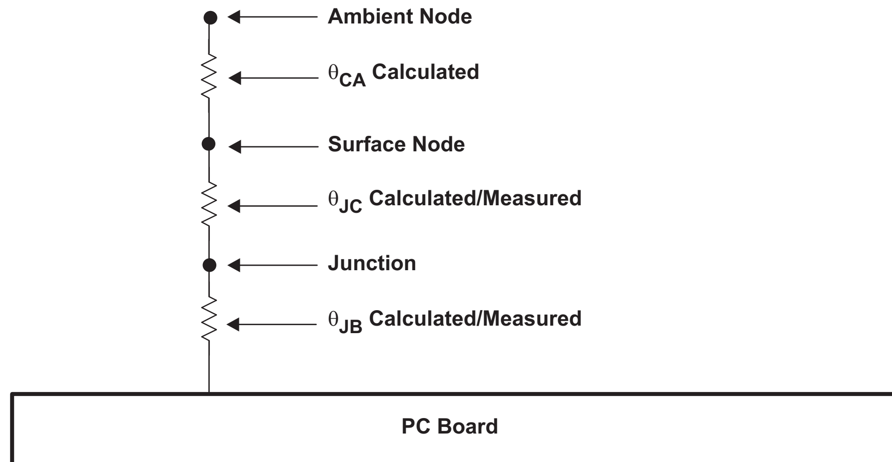

Figure 11. Thermal Resistance

Additional information about thermal metrics for integrated circuits is available in the Texas Instruments Application Note *IC Package Thermal Metrics* (SPRA953).

ControlNet APPLICATION

In a typical ControlNet application, several nodes will be connected to a common bus, as shown in Figure 12. At any time, only one node should actively drive the bus; all active nodes continually receive the bus state. The node which is actively driving the bus will sink current through either the XF1 or XF3 terminal, causing the voltage on the bus to be either differential high or differential low.

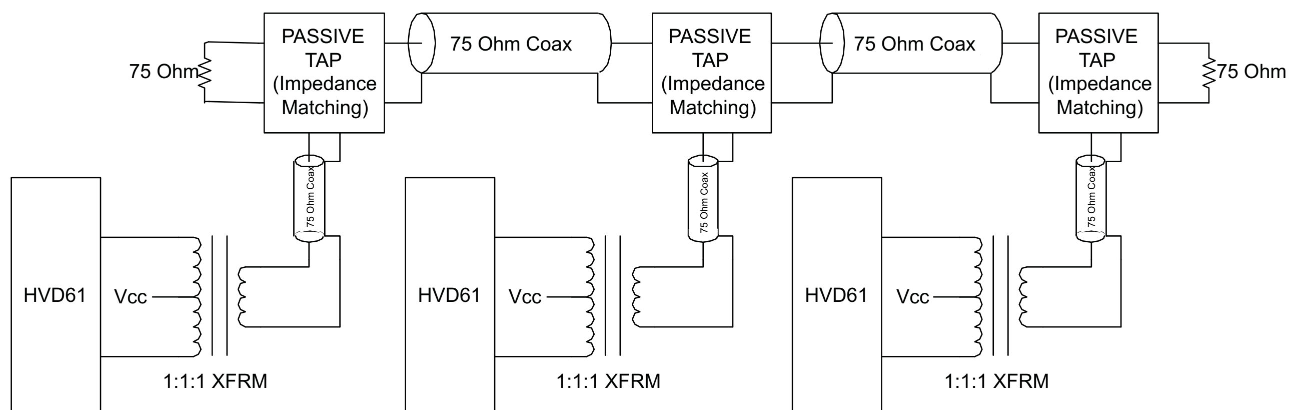

Figure 12. Typical ControlNet Application

Copyright © 2007–2011, Texas Instruments Incorporated

SYSTEM-LEVEL EMC PROTECTION

The ControlNet network is intended to operate reliably in harsh industrial environments. At a system level, the network is tested according to several international electromagnetic compatibility (EMC) standards. The requirements are summarized in the Table 2 and Figure 13.

Table 2. EMC Standard Requirements

EMC STANDARD	DESCRIPTION OF TEST METHOD	LEVEL
IEC 61000-4-2	Electro Static Discharge (ESD) Immunity	6 kV Contact 8 kV Air-Gap
IEC 61000-4-3	Radiated Radio Frequency (RF) Immunity	10V/m at 80 MHz to 2.7GHz
IEC 61000-4-4	Fast Transients / Burst Immunity	1 kV
IEC 61000-4-5	Surge Immunity	1 kV
IEC 61000-4-6	Conducted Radio Frequency (RF) Immunity	10V at 150 kHz to 80 MHz 1kHz AM 80% modulation

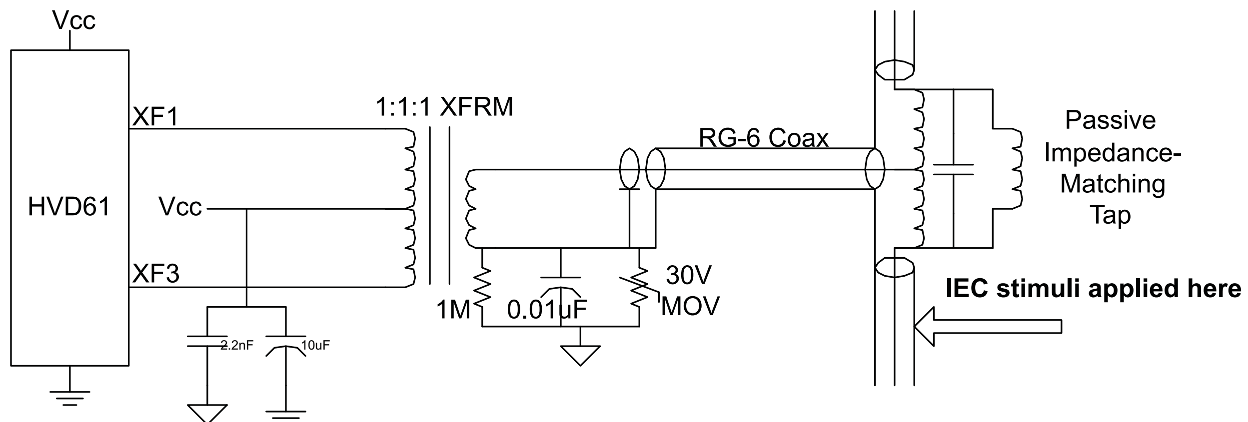

Figure 13. Simplified Test Set-Up for EMC Standards

DRIVER FUNCTIONS

The ControlNet standard requires the transmitter to generate a signal with nominal amplitude of 8.2Vpp into a 37.5 Ω load. This applies to the double-terminated coax bus as shown in Figure 12. Rise and fall times should not exceed 30 nsec, and the signal slew rate should not exceed 1 V/nsec. Transmit signal distortion (ringing, droop, overshoot) should not exceed 10% of the peak-to-peak amplitude.

RECEIVER FUNCTIONS

The function of the primary receiver (RX) and the carrier detect (CD) depends on the signals XF1 and XF3. The purpose of RX is to indicate the status of the two ControlNet bus lines, based on the signals XF1 and XF3. If the voltage at XF3 is greater than the voltage at XF1, then the bus state is positive, and RX should output a HIGH voltage. This corresponds to a Phy_1 symbol. If the voltage at XF3 is less than the voltage at XF1, then the bus state is negative, and RX should output a LOW voltage. This corresponds to a Phy_0 symbol. See Figure 14. Note that the allowable variation in V_{TH-}, V_{TH+}, and V_{CD} is specified in the ELECTRICAL CHARACTERISTICS table.

Copyright © 2007–2011, Texas Instruments Incorporated

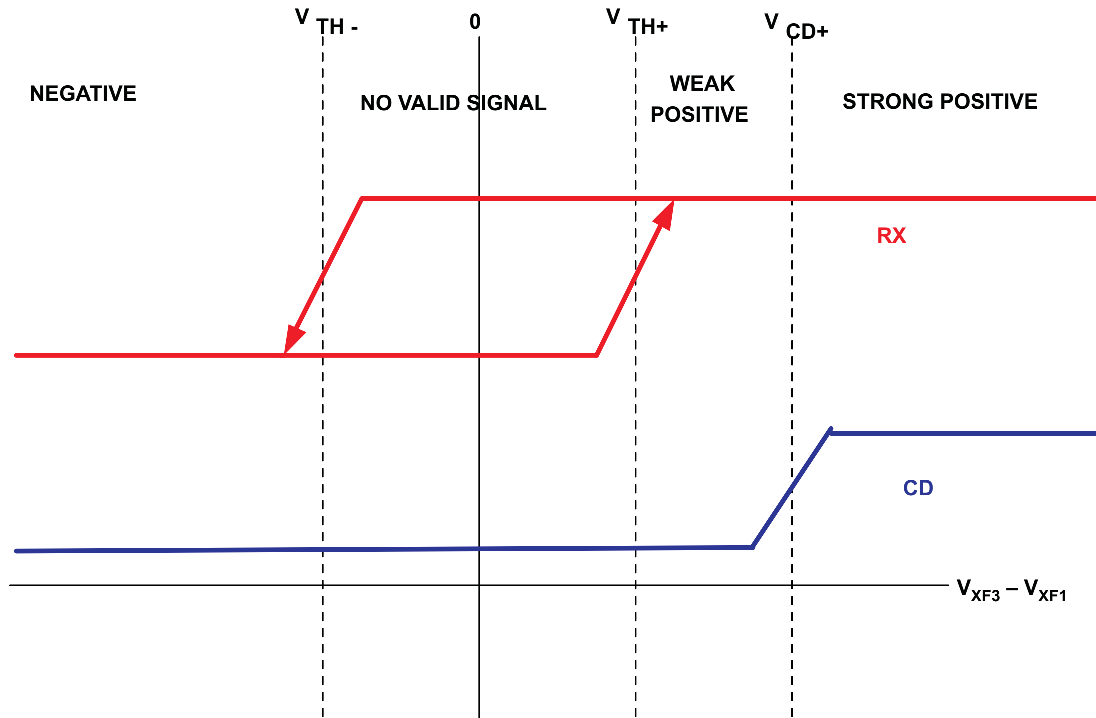

Figure 14. RX and CD Functions

SIGNAL STRENGTH OUTPUT

Vsig should be sampled at the beginning of a transmission in the preamble portion of the ControlNet Frame. This portion is the same for all nodes with the exception of the amplitude. Sampling Vsig in the preamble will provide the most consistent measurement. Further oversampling coupled with multiple frame sampling may provide further cable diagnostics such as identifying reflections due to cable breaks. By sampling multiple times in the preamble of a packet the distance to the break or short may be calculated.

REVISION HISTORY

NOTE: Page numbers of current version may differ from previous versions.

Changes from Revision C (May 2007) to Revision D **Page**

- Changed ControlNet is a trademark of ControlNet International, Ltd to ControlNet is a trademark of ODVA 1
- Changed Vcc MIN from "4.75V" to "4.5V" and changed Vcc MAX from "5.25V" to "5.5V" in the ROC table 3
- Changed V_{DD} spec. MAX voltage from "5.25V" to "5.5V" in the ROC table 3
- Changed Bus pin common-mode voltage MIN spec. from "4.75V to "4.5V" and MAX spec. from "5.25V to "5.5V" in the ROC table 3
- Added second T_A spec and condiitions in the ROC table 3
- Changed V_{TH+} spec. Test Conditions from "4.75V < Vcm < 5.25V" to "4.5V < Vcm < 5.5V" 4
- Changed V_{TH-} spec. Test Conditions from "4.75V < Vcm < 5.25V" to "4.5V < Vcm < 5.5V" 4
- Changed V_{hys} spec. Test Conditions from "4.75V < Vcm < 5.25V" to "4.5V < Vcm < 5.5V" 4
- Changed V_{CD} spec. Test Conditions from "4.75V < Vcm < 5.25V" to "4.5V < Vcm < 5.5V" 4
- Changed $I_{O(off)}$ spec. Test Conditions maximum voltage from "5.25V" to "5.5V" 4
- Added second GAIN spec with conditions of 4.5V ≤ V_{CC} ≤ 5.5V in the ELEC CHARA TABLE, and added 140 mV/V to the MAX column 4
- Changed I_{DD} (chip disabled) spec MAX from "10" to "105" µA 4
- Added "0°C < T < 85°C" to Test Conditions for SR spec. 5
- Deleted minimum spec value (1 ns) for Receivers (RX and CD) "Output rise time, t_r and Output fall time, t_f" 5
- Changed RECEIVERS (RX and CD) t_{PLH} spec and t_{PHL} spec MAX value from "35" tp "40" ns. 5
- Changed $t_{sk(p)}$ spec MAX value from "3.5" to 4.5" for RX test condition 5
- Changed RECEIVER t_{PLZ} spec and t_{PHZ} spec MAX value from "40" to "55" ns. 5

SN65HVD61DRG4	ACTIVE	SOIC	D	14	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 100	65HVD61	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

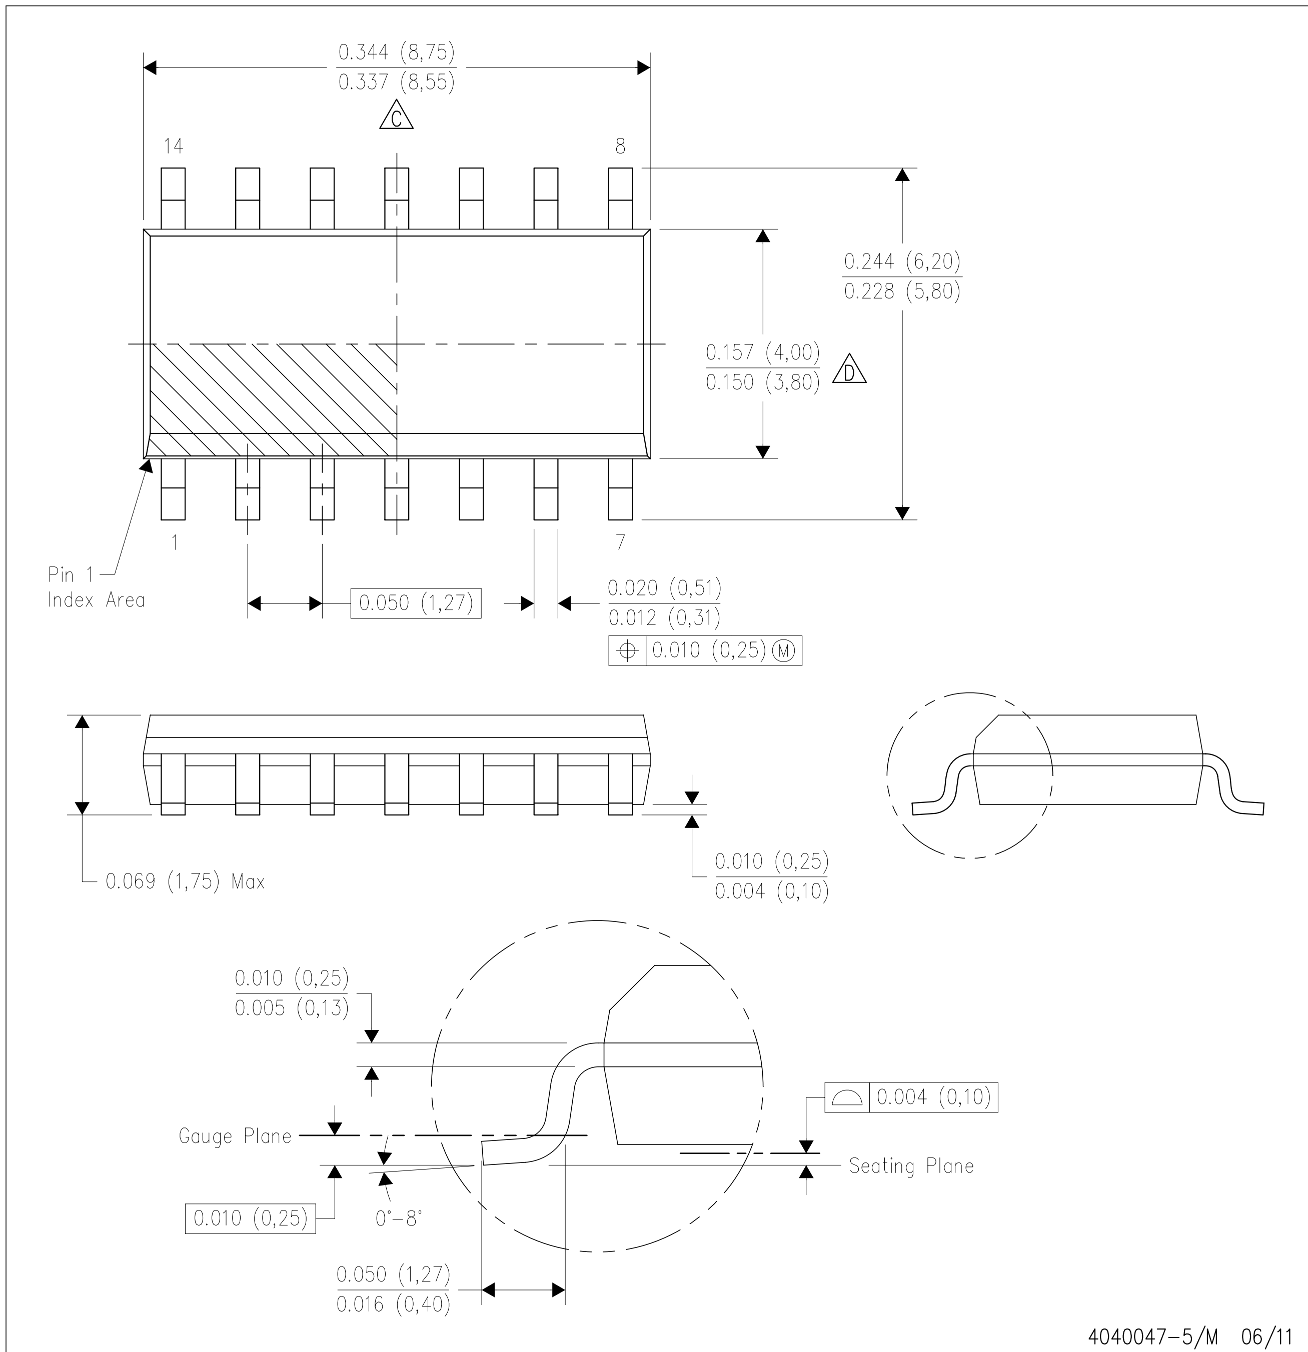
(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

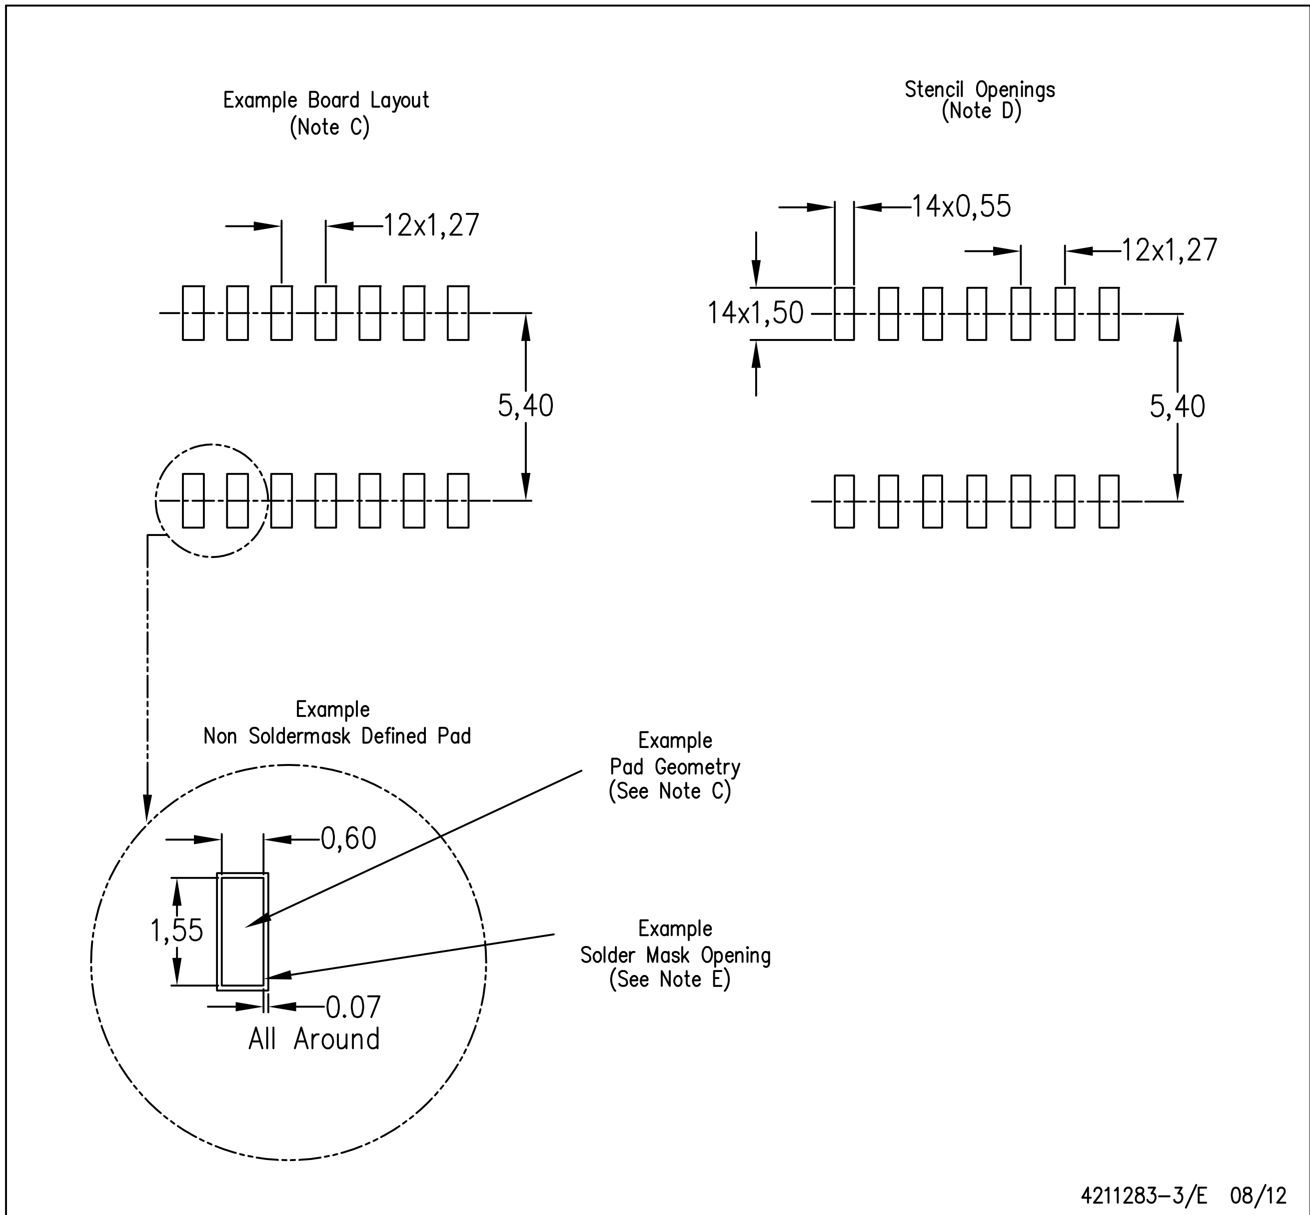
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

D (R–PDSO–G14) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
D. Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
E. Reference JEDEC MS-012 variation AB.

D (R–PDSO–G14) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC–7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
