

## Two-Port HDMI Switch

Check for Samples: [TMDS261B](#)

### FEATURES

- **2:1 Sink-side switch Supporting DVI Above 1920 × 1200 and HDMI HDTV Resolutions up to 1080p With 16-Bit Color Depth**
- **Designed for Signaling Rates up to 3 Gbps**
- **Supports HDMI 1.3a Specification**
- **Adaptive Equalization on inputs to support up to 20-m HDMI Cable at 2.25 Gbps for 1080p 12-Bit Color Depth**
- **TMDS Input Clock-Detect Circuit**
- **DDC Repeater Function**
- **<2-mW Low-Power Mode**
- **Local I<sup>2</sup>C or GPIO Configurable**
- **Enhanced ESD. HBM: 10 kV on All Input TMDS, DDC I<sup>2</sup>C, HPD Pins**

- **3.3-Volt Power Supply**
- **Temperature Range: 0°C to 70°C**
- **64-Pin TQFP Package: Pin-Compatible With TMDS251**
- **Robust TMDS Receive Stage That Can Work With Non-Compliant Input Common-Mode HDMI Signal**

### APPLICATIONS

- **High-Definition Digital TV**
  - LCD
  - Plasma
  - DLP<sup>®</sup>

### DESCRIPTION

The TMDS261B is a two-port digital video interface (DVI) or high-definition multimedia interface (HDMI) switch that allows up to two DVI or HDMI ports to be switched to a single display terminal. Four TMDS channels, one hot-plug detector, and a digital display control (DDC) interface are supported on each port. Each TMDS channel supports signaling rates up to 3 Gbps to allow 1080p resolution in 16-bit color depth. TMDS261B device is not intended for source side applications such as external switch boxes.

The TMDS261B provides an adaptive equalizer for different ranges of cable lengths. The equalizer automatically compensates for intersymbol interference [ISI] loss of an HDMI/DVI cable for up to 20 dB at 3 Gbps (see [Figure 15](#)).

### TYPICAL APPLICATION

M0124-02

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## DESCRIPTION (CONTINUED)

When any of the input ports are selected, the integrated terminations (50-Ω termination resistors pulled up to VCC) are switched on for the TMDS clock channel, the TMDS clock-detection circuit is enabled, and the DDC repeater is enabled. After a valid TMDS clock is detected, the integrated termination resistors for the data lines are enabled, and the output TMDS lines are enabled. When an input port is not selected, the integrated terminations are switched off, the TMDS receivers are disabled, and the DDC repeater is disabled. Clock-detection circuitry provides an automatic power-management feature, because if no valid TMDS clock is detected, the terminations on the input TMDS data lines are disconnected and the TMDS outputs are placed in a high-impedance state.

The TMDS261B is designed to be controlled via a local I<sup>2</sup>C interface or GPIO interface, based on the status of the I2C\_SEL pin. The local I<sup>2</sup>C interface in TMDS261B is a slave-only I<sup>2</sup>C interface. (See the [I2C INTERFACE NOTES](#) section.)

**I<sup>2</sup>C Mode:** When the I2C\_SEL pin is set low, the device is in I<sup>2</sup>C mode. With local I<sup>2</sup>C, the interface port status can be read, and the advanced configurations of the device such as TMDS output edge rate control, DDC I<sup>2</sup>C buffer output-voltage-select (OVS) settings (See the [DDC I2C Function Description](#) for detailed description on DDC I<sup>2</sup>C buffer description and OVS description), device power management, TMDS clock-detect feature, and TMDS input-port selection can be set. See [Table 8](#) through [Table 11](#).

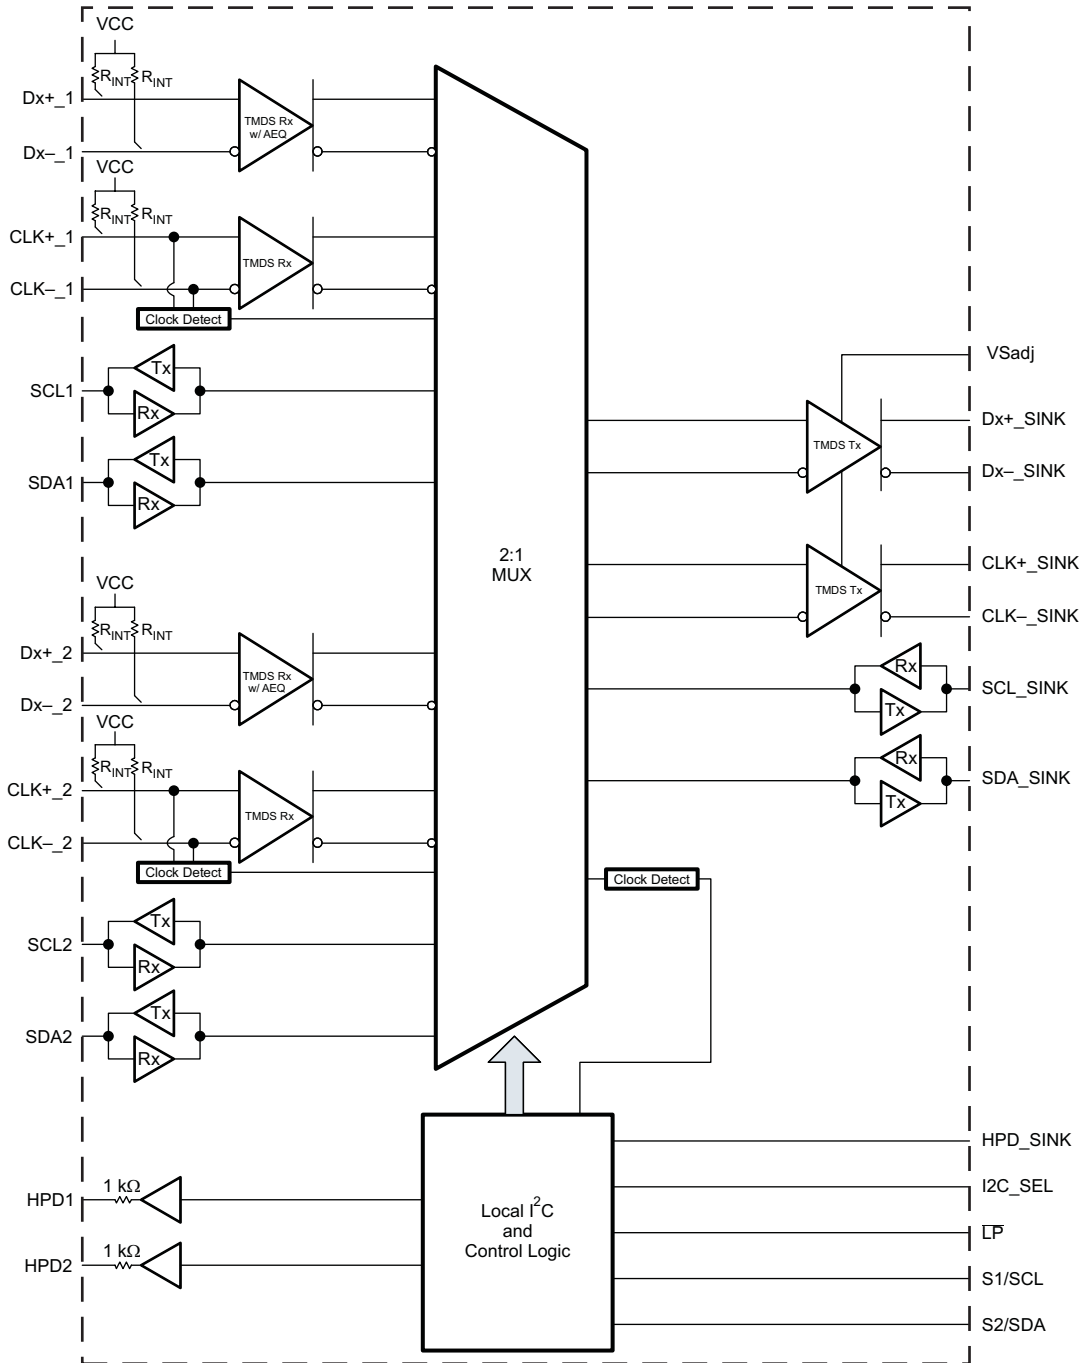

**GPIO mode:** When the I2C\_SEL pin is set high, the device is in GPIO control mode. The port selection is controlled with source selectors, S1 and S2. The power-saving mode is controlled through the LP pin. In GPIO mode, the default TMDS output edge rate that is the fastest setting of rise and fall time is set, and the default DDC I<sup>2</sup>C buffer OVS setting (OVS3) is set. See [Table 8](#) and the [DDC I2C Function Description](#) for a detailed description of the DDC I<sup>2</sup>C buffer.

Following are some of the key features (advantages) that the TMDS261B provides to the overall sink-side system (HDTV).

- 2×1 switch that supports TMDS data rates up to 3 Gbps on both input ports.
- ESD: Built-in support for high ESD protection (up to 10 kV on the HDMI source side). The HDMI source-side pins on the TMDS261B are connected via the HDMI/DVI exterior connectors and cable to the HDMI/DVI sources (e.g., DVD player). In TV applications, it can be expected that the source side may be subjected to higher ESD stresses compared to the sink side that is connected internally to the HDMI receiver.
- Adaptive equalization: The built-in adaptive equalization support compensates for intersymbol interference [ISI] loss of up to 20 dB, which represents a typical 20-m HDMI/DVI cable at 3 Gbps. Adaptive equalization adjusts the equalization gain **automatically**, based on the cable length and the incoming TMDS data rate.
- TMDS clock-detect circuitry: This feature provides an automatic power-management feature and also ensures that the TMDS output port is turned on only if there is a valid TMDS input signal. The TMDS clock-detect feature can be by-passed in I<sup>2</sup>C mode; see [Table 10](#) and [Table 11](#). It is recommended to enable TMDS clock-detect circuitry during normal operation. However, for HDMI compliance testing (TMDS termination-voltage test), the clock-detect feature should be disabled by using the I<sup>2</sup>C mode control. If the customer requires passing the TMDS termination-voltage test in the GPIO mode with the default TMDS clock-detect circuitry enabled, then a valid TMDS clock should be provided for this compliance test, so that the terminations on the TMDS data pair can be connected and thus customer can pass the TMDS termination-voltage test.
- DDC I<sup>2</sup>C buffer: This feature provides isolation on the source-side and sink-side DDC I<sup>2</sup>C capacitance, thus helping the sink system to pass system-level compliance.
- Robust TMDS receive stage: This feature ensures that the TMDS261B can work with TMDS input signals having common-mode voltage levels that can be either compliant or non-compliant with HDMI/DVI specifications.
- VSadj: This feature adjusts the TMDS output swing and can help the sink system to tune the output TMDS swing of the TMDS261B (if needed) based on the system requirements.
- GPIO or local I<sup>2</sup>C interface to control the device features
- TMDS output edge-rate control: This feature adjusts the TMDS261B TMDS output rise and fall times. There

are four settings of the rise and fall times that can be chosen. The default setting is the fastest rise and fall time; the other three settings are slower. Slower edge transitions can potentially help the sink system (HDTV) in passing regulatory EMI compliance.

# TMDS261B

SLLS987A – SEPTEMBER 2009 – REVISED JULY 2011

[www.ti.com](http://www.ti.com)

## DEVICE POWER

The TMDS261B is designed to operate from a single 3.3-V supply voltage. The TMDS261B has three power modes of operation. These three modes are referred to as normal mode, standby mode, and low-power mode.

Normal mode is designed to be used during typical operating conditions. In normal mode, the device is fully functional and consumes the greatest amount of power.

Standby mode is designed to be used when reduced power is desired, but DDC and HPD communication must be maintained. Standby mode can be enabled via the I<sup>2</sup>C interface (See Table 8 through Table 11) or GPIO interface (See Table 1). In standby mode, the high-speed TMDS data and clock channels are disabled to reduce power consumption. The internal I<sup>2</sup>C logic and DDC function normally. HPD[1:3] follow HPD\_SINK.

Low-power mode is designed to consume the least possible amount of power while still applying 3.3 V to the device. Low-power mode can be enabled by either the  $\overline{\text{LP}}$  pin or by local I<sup>2</sup>C (See Table 8 through Table 11). In low-power mode, all of the inputs and outputs are disabled with the exception of the internal I<sup>2</sup>C logic and  $\overline{\text{LP}}$  pin.

The clock-detect feature in the TMDS261B provides an automatic power-management feature in normal mode. If no valid TMDS clock is detected, the terminations on the input TMDS data lines are disconnected, and the TMDS outputs are high-Z. As soon as a valid TMDS clock is detected, the terminations on the TMDS data lines are connected, the TMDS outputs come out of high-Z, and the device is fully functional and consumes the greatest amount of power.

## ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>CC</sub>	Normal-mode supply current	$\overline{\text{LP}}$ = HIGH, TMDS: V <sub>ID(pp)</sub> = 1200 mV, 3 Gbps TMDS data pattern; HPD_SINK = HIGH, S1/S2 = LOW/HIGH, HIGH/HIGH		170	216	mA
I <sub>STBY</sub>	Standby supply current	$\overline{\text{LP}}$ = HIGH, TMDS: V <sub>ID(pp)</sub> = 1200 mV, 3 Gbps TMDS data pattern; HPD_SINK = HIGH, S1 = HIGH, S2 = LOW		3	5.5	mA
I <sub>SD</sub>	Shutdown current	$\overline{\text{LP}}$ = LOW		300	555	μA
I <sub>NCLK</sub>	Normal-mode supply current, with no active TMDS input clock	$\overline{\text{LP}}$ = HIGH, No TMDS input clock, HPD_SINK = HIGH, S1/S2 = LOW/HIGH, HIGH/HIGH		12	18	mA

## HOT-PLUG DETECT

The TMDS261B is designed to support the hot-plug indication to the input ports (HDMI/DVI sources connected to TMDS261B) via the HPD[1:2] output pins. The state of the hot-plug output of the selected source follows the state of the hot-plug input (HPD\_SINK input pin) from the sink side. The state of the hot-plug output for the non-selected source goes low (See Table 1).

The maximum V<sub>OH</sub> of the HPD depends on VCC. It is recommended that if V<sub>OH</sub> greater than 3.6 V is needed on HPD, then an external circuit can be used to drive the V<sub>OH</sub> from the 5 V of the HDMI source (connected as shown in Figure 45).

## ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>OH(HPD)</sub>	High-level output voltage	I <sub>OH</sub> = 100 μA	2		VCC	V
V <sub>OL(HPD)</sub>	Low-level output voltage	I <sub>OL</sub> = 100 μA	0		0.4	V
I <sub>H</sub>	High-level input current	V <sub>IH</sub> = 2 V, VCC = 3.6 V	-10		10	μA
I <sub>L</sub>	Low-level input current	V <sub>IL</sub> = 0.8 V, VCC = 3.6 V	-10		10	μA
R <sub>L</sub>	Output source impedance		800	1000	1200	Ω

## TMDS261B

SLLS987A – SEPTEMBER 2009 – REVISED JULY 2011

[www.ti.com](http://www.ti.com)

### TMDS DDC and Local I<sup>2</sup>C Pins

**DDC I<sup>2</sup>C Buffer or Repeater:** The TMDS261B provides buffering on the DDC I<sup>2</sup>C interface for each of the input ports connected. This feature isolates the capacitance on the source side from the sink side and thus helps in passing system-level compliance. See the [DDC I<sup>2</sup>C Function Description](#) section for a detailed description on how the DDC I<sup>2</sup>C buffer operates. Note that a key requirement on the sink side is that the  $V_{IL(Sink)}$  (input to TMDS261B) should be less than 0.4 V. This requirement should be met for the DDC I<sup>2</sup>C buffer to function properly. There are three settings of  $V_{IL(Sink)}$  and  $V_{OL(Sink)}$  that can be chosen based on OVS settings (See [Table 8](#) through [Table 11](#)).

**Local I<sup>2</sup>C Interface:** The TMDS261B includes a slave I<sup>2</sup>C interface to control device features like TMDS input port selection, TMDS output edge-rate control, power management, DDC buffer OVS settings, etc. See [Table 8](#) through [Table 11](#).

The TMDS261B is designed to be controlled via a local I<sup>2</sup>C interface or GPIO interface, based on the status of the I2C\_SEL pin. The local I<sup>2</sup>C interface in the TMDS261B is only a slave I<sup>2</sup>C interface. See the [I<sup>2</sup>C INTERFACE NOTES](#) section for a detailed description of I<sup>2</sup>C functionality.

### ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_L$	Low-level input current		VCC = 3.6 V, $V_I = 0$ V	-10		10	μA

## TMDS Main Link Pins

The TMDS port of the TMDS261B is designed to support the Digital Video Interface (DVI) 1.0 and High Definition Multimedia Interface (HDMI) 1.3 specifications. The differential output voltage swing can be fine-tuned with the VSadj resistor.

## ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>OH</sub>	Single-ended HIGH-level output voltage	AVCC = 3.3 V, R <sub>T</sub> = 50 Ω	AVCC – 10		AVCC + 10	mV
V <sub>OL</sub>	Single-ended LOW-level output voltage		AVCC – 600		AVCC – 400	mV
V <sub>SWING</sub>	Single-ended output voltage swing		400		600	mV
V <sub>OC(SS)</sub>	Change in steady-state common-mode output voltage between logic states				5	mV
V <sub>OD(pp)</sub>	Peak-to-peak output differential voltage		800		1200	mV
V <sub>(O)SBY</sub>	Single-ended standby output voltage		AVCC – 10		AVCC + 10	mV
I <sub>(O)OFF</sub>	Single-ended power-down output current	0 V ≤ VCC ≤ 1.5 V, AVCC = 3.3 V, R <sub>T</sub> = 50 Ω	–10		10	μA
I <sub>OS</sub>	Short-circuit output current	See <a href="#">Figure 16</a>	–15	12	15	mA
V <sub>CD(pp)</sub>	Minimum valid clock differential voltage (peak-to-peak)	Input TMDS clock frequency = 300 MHz	100			mV

## SWITCHING CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT	
t <sub>PLH</sub>	Propagation delay time	AVCC = 3.3 V, R <sub>T</sub> = 50 Ω. See <a href="#">Figure 9</a> and <a href="#">Figure 10</a> .	250		800	ps	
t <sub>PHL</sub>	Propagation delay time		250		800	ps	
t <sub>R1</sub>	Rise time, fastest mode (default setting): fastest setting		84	110	140	ps	
t <sub>F1</sub>	Fall time, fastest mode (default setting): fastest setting		84	110	140	ps	
t <sub>R2</sub>	Rise time, fastest mode + 50 ps (approximately)		142	160	190	ps	
t <sub>F2</sub>	Fall time, fastest mode + 50 ps (approximately)		142	160	190	ps	
t <sub>R3</sub>	Rise time, fastest mode + 100 ps (approximately)		187	210	230	ps	
t <sub>F3</sub>	Fall time, fastest mode + 100 ps (approximately)		187	210	230	ps	
t <sub>R4</sub>	Rise time, fastest mode + 120 ps (approximately): slowest setting		216	230	260	ps	
t <sub>F4</sub>	Fall time, fastest mode + 120 ps (approximately): slowest setting		216	230	260	ps	
t <sub>SK(P)</sub>	Pulse skew (see <sup>(2)</sup> )			8	15	ps	
t <sub>SK(D)</sub>	Intra-pair skew		AVCC = 3.3 V, R <sub>T</sub> = 50 Ω. See <a href="#">Figure 11</a> .		10	30	ps
t <sub>SK(O)</sub>	Inter-pair skew (see <sup>(3)</sup> )					100	ps
t <sub>JITD(pp)</sub>	Peak-to-peak output residual data jitter	AVCC = 3.3 V, R <sub>T</sub> = 50 Ω, dR = 2.25 Gbps. See <a href="#">Figure 14</a> for measurement setup; residual jitter is the total jitter measured at TTP4 minus the jitter measured at TTP1. See <a href="#">Figure 15</a> for the loss profile of the cable used for t <sub>JITD(pp)</sub> measurement. Also see <a href="#">Typical Curves</a> for t <sub>JITD(pp)</sub> across cable length and input TMDS data rate.		125	198	ps	

(1) All typical values are at 25°C and with a 3.3-V supply.

(2) t<sub>sk(p)</sub> is the magnitude of the time difference between t<sub>PLH</sub> and t<sub>PHL</sub> of a specified terminal.

(3) t<sub>sk(o)</sub> is the magnitude of the difference in propagation delay times between any specified terminals of a sink-port bank when inputs of the active source port are tied together.

**SWITCHING CHARACTERISTICS (continued)**

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$t_{JITC(PP)}$ Peak-to-peak output residual clock jitter	AVCC = 3.3 V, $R_T = 50 \Omega$ , input TMDS clock frequency = 225 MHz. See Figure 14 for measurement setup; residual jitter is the total jitter measured at TTP4 minus the jitter measured at TTP1. See Figure 15 for the loss profile of the cable used for $t_{JITC(PP)}$ measurement. $t_{JITC(PP)}$ is measured at TMDS differential clock signal crossing.		54	84	ps
$t_{CLK1}$ Valid clock-detect enable time	AVCC = 3.3 V, $R_T = 50 \Omega$ , input TMDS clock frequency = 300 MHz. See Figure 13.		300	500	ns
$t_{CLK2}$ Invalid clock-detect disable time	AVCC = 3.3 V, $R_T = 50 \Omega$ , input TMDS clock frequency = 1 MHz. See Figure 13.		500	800	ns
$t_{SEL1}$ Port selection time (see <sup>(4)</sup> )	AVCC = 3.3 V, $R_T = 50 \Omega$		300	500	ns
$t_{SEL2}$ Port deselection time (see <sup>(5)</sup> )	AVCC = 3.3 V, $R_T = 50 \Omega$		40	50	ns
$f_{CD}$ Clock-detect frequency	AVCC = 3.3 V, $R_T = 50 \Omega$ . See Figure 13.	25		300	MHz

- (4)  $t_{SEL1}$  includes the time for the valid clock-detect enable time and  $t_{S1(HPD)}$ , because the  $t_{S1(HPD)}$  event happens in parallel with  $t_{SEL1}$ ; thus, the  $t_{SEL1}$  time is primarily the  $t_{CLK1}$  time.
- (5)  $t_{SEL2}$  is primarily the  $t_{S2(HPD)}$  time.

## APPLICATION INFORMATION

**Table 3. TMDS261B vs TMDS251 Pinout**

PIN NUMBER	I/O	TMDS251	TMDS261B
Pins 32 and 33	I	GPIO mode: S1 and S2 configured as source selector pins	GPIO mode: S1 and S2 configured as source selector pins (same as TMDS251) I <sup>2</sup> C mode: S1 and S2 configured as SCL and SDA for local slave I <sup>2</sup> C communication
Pin 34	I	EQ: TMDS input equalization control select EQ = High – 10-m 28 AWG HDMI cable EQ = Low – HDMI 1.3 compliant cable	I2C_SEL: GPIO / local I <sup>2</sup> C control select I2C_SEL = High – Device is configured by GPIO logic. I2C_SEL = Low – Device is configured by I <sup>2</sup> C logic.
Pin 49	—	VDD: HPD/DDC power supply	$\overline{\text{LP}}$ : Low-power mode-select bar $\overline{\text{LP}}$ = High – Normal operational mode $\overline{\text{LP}}$ = Low – Device goes into low-power state.

Based on the differences listed in [Table 3](#), attention must be given to pin 34, which determines whether the device uses I<sup>2</sup>C or GPIO control.

### Supply Voltage

The TMDS261B is powered up with a single power source that is 3.3-V VCC for the TMDS circuitry for HPD, DDC, and most of the control logic.

### TMDS Input Fail-Safe

The TMDS261B incorporates clock-detect circuitry. If there is no valid TMDS clock from the connected HDMI/DVI source, the TMDS261B does not switch on the terminations on the source-side data channels. Additionally, the TMDS outputs are placed in the high-impedance state. This prevents the TMDS261B from turning on its outputs if there is no valid incoming HDMI/DVI data.

### TMDS Outputs

A 10% precision resistor, 4.02-k $\Omega$ , is recommended to control the output swing to the HDMI-supporting 800-mV to 1200-mV range  $V_{\text{OD(pp)}}$  (1000 mV typical). The TMDS outputs are high-impedance under standby-mode operation, S1 = H and S2 = L.

### DDC I<sup>2</sup>C Function Description

The TMDS261B provides buffers on the DDC I<sup>2</sup>C lines on both input ports. This section explains the operation of the buffer. For representation, the source side of the TMDS261B is represented by RSCL/RSDA, and the sink side is represented by TSCL/TSDA. The buffers on the RSCL/RSDA and TSCL/TSDA pins are 5-V tolerant when the device is powered off and high-impedance under low supply voltage, 1.5 V or below. If the device is powered up, the driver T (see [Figure 40](#)) is turned on or off depending on the corresponding R-side voltage level.

When the R side is driven low below 1.5 V, the corresponding T-side driver turns on and drives the T side down to a low level output voltage,  $V_{\text{OL}}$ . The value of  $V_{\text{OL}}$  and  $V_{\text{IL}}$  on the T side or the sink side of the TMDS261B switch depends on the output-voltage select (OVS) control settings. OVS control can be changed by the slave I<sup>2</sup>C, see [Table 8](#). When the OVS1 setting is selected,  $V_{\text{OL}}$  is typically 0.7 V and  $V_{\text{IL}}$  is typically 0.4 V. When the OVS2 setting is selected,  $V_{\text{OL}}$  is typically 0.6 V and  $V_{\text{IL}}$  is typically 0.4 V. When the OVS3 setting (default) is selected,  $V_{\text{OL}}$  is typically 0.5 V and  $V_{\text{IL}}$  is typically 0.3 V.  $V_{\text{OL}}$  is always higher than the driver-R input threshold,  $V_{\text{IL}}$  on the T side or the sink side, preventing lockup of the repeater loop. The TMDS261B is targeted primarily as a switch in the HDTV market and is expected to be a companion chip to an HDMI receiver; thus, the OVS control has been provided on the sink side, so that the requirement of  $V_{\text{IL}}$  to be less than 0.4 V can be met. The  $V_{\text{OL}}$  value can be selected to improve or optimize noise margins between  $V_{\text{OL}}$  and  $V_{\text{IL}}$  of the repeater itself or  $V_{\text{IL}}$  of some external device connected on the T side.

When the R side is pulled up, above 1.5 V, the T-side driver turns off and the T-side pin is high-impedance.

**Figure 40. I<sup>2</sup>C Drivers in the TMDS261B (R Side Is the HDMI Source Side, T Side Is the HDMI Sink Side)**

When the T side is driven below 0.4 V by an external I<sup>2</sup>C driver, both drivers R and T are turned on. Driver R drives the R side to near 0 V, and driver T is on, but is overridden by the external I<sup>2</sup>C driver. If driver T is already on, due to a low on the R side, driver R just turns on.

When the T side is released by the external I<sup>2</sup>C driver, driver T is still on, so the T side is only able to rise to the V<sub>OL</sub> of driver T. Driver R turns off, because V<sub>OL</sub> is above its 0.4-V V<sub>IL</sub> threshold, releasing the R side. If no external I<sup>2</sup>C driver is keeping the R side low, the R side rises, and driver T turns off once the R side rises above 1.5 V, see Figure 41.

**Figure 41. Waveform of Driver T Turning Off**

It is important that any external I<sup>2</sup>C driver on the T side is able to **drive** the bus below 0.4 V to achieve full operation. If the T side cannot be driven below 0.4 V, driver R may not recognize and transmit the low value to the R side.

**DDC I<sup>2</sup>C Behavior**

The typical application of the TMDS261B is as a 2×1 switch in a TV, connecting up to two HDMI input sources to an HDMI receiver. The I<sup>2</sup>C repeater is 5-V tolerant, and no additional circuitry is required to translate between 3.3-V and 5-V bus voltages. In the following example, the system master is running on an R-side I<sup>2</sup>C-bus, whereas the slave is connected to a T-side bus. Both buses run at 100 kHz, supporting standard-mode I<sup>2</sup>C operation. Master devices can be placed on either bus.

**Figure 42. Typical Application**

Figure 43 illustrates the waveforms seen on the R-side I<sup>2</sup>C-bus when the master writes to the slave through the I<sup>2</sup>C repeater circuit of the TMDS261B. This looks like a normal I<sup>2</sup>C transmission, and the turnon and turnoff of the acknowledge signals are slightly delayed.

Figure 43. Bus-R Waveform

Figure 44 illustrates the waveforms seen on the T-side I<sup>2</sup>C-bus under the same operation as in Figure 43. On the T-side of the I<sup>2</sup>C repeater, the clock and data lines would have a positive offset from ground equal to the V<sub>OL</sub> of the driver T. After the eighth clock pulse, the data line is pulled to the V<sub>OL</sub> of the slave device, which is very close to ground in this example. At the end of the acknowledge, the slave device releases and the bus level rises back to the V<sub>OL</sub> set by the driver until the R-side rises above V<sub>CC</sub>/2, after which it continues to be high. It is important to note that any arbitration or clock-stretching events require that the low level on the T-side bus at the input of the TMDS261B I<sup>2</sup>C repeater is below 0.4 V to be recognized by the device and then transmitted to the R-side I<sup>2</sup>C bus.

Figure 44. Bus-T Waveform

## I<sup>2</sup>C Pullup Resistors

The pullup resistor value is determined by two requirements:

1. The maximum sink current of the I<sup>2</sup>C buffer:

The maximum sink current is 3 mA or slightly higher for an I<sup>2</sup>C driver supporting standard-mode I<sup>2</sup>C operation.

$$R_{up(min)} = V_{DD} / I_{sink} \quad (1)$$

2. The maximum transition time on the bus:

The maximum transition time, T, of an I<sup>2</sup>C bus is set by an RC time constant, where R is the pullup resistor value and C is the total load capacitance. The parameter, k, can be calculated from Equation 3 by solving for t, the times at which certain voltage thresholds are reached. Different input threshold combinations introduce different values of t. Table 4 summarizes the possible values of k under different threshold combinations.

$$t = k \times RC \quad (2)$$

$$V(t) = V_{DD} (1 - e^{-t/RC}) \quad (3)$$

Table 4. Value of k for Different Input Threshold Voltages

V <sub>th-</sub> /V <sub>th+</sub>	0.7 V <sub>DD</sub>	0.65 V <sub>DD</sub>	0.6 V <sub>DD</sub>	0.55 V <sub>DD</sub>	0.5 V <sub>DD</sub>	0.45 V <sub>DD</sub>	0.4 V <sub>DD</sub>	0.35 V <sub>DD</sub>	0.3 V <sub>DD</sub>
0.1 V <sub>DD</sub>	1.0986	0.9445	0.8109	0.6931	0.5878	0.4925	0.4055	0.3254	0.2513
0.15 V <sub>DD</sub>	1.0415	0.8873	0.7538	0.6360	0.5306	0.4353	0.3483	0.2683	0.1942
0.2 V <sub>DD</sub>	0.9808	0.8267	0.6931	0.5754	0.4700	0.3747	0.2877	0.2076	0.1335

**Table 4. Value of k for Different Input Threshold Voltages (continued)**

0.25 V <sub>DD</sub>	0.9163	0.7621	0.6286	0.5108	0.4055	0.3102	0.2231	0.1431	0.0690
0.3 V <sub>DD</sub>	0.8473	0.6931	0.5596	0.4418	0.3365	0.2412	0.1542	0.0741	—

From Equation 1,  $R_{up(min)} = 5.5 \text{ V}/3 \text{ mA} = 1.83 \text{ k}\Omega$  to operate the bus under a 5-V pullup voltage and provide less than 3 mA when the I<sup>2</sup>C device is driving the bus to a low state. If a higher sink current, for example 4 mA, is allowed,  $R_{up(min)}$  can be as low as 1.375 k $\Omega$ .

Given a 5-V I<sup>2</sup>C device with input low and high threshold voltages at 0.3 V<sub>DD</sub> and 0.7 V<sub>dd</sub>, respectively, the value of k is 0.8473 from Table 4. Taking into account the 1.83-k $\Omega$  pullup resistor, the maximum total load capacitance is  $C_{(total-5V)} = 645 \text{ pF}$ .  $C_{cable(max)}$  should be restricted to be less than 545 pF if  $C_{source}$  and  $C_i$  can be as high as 50 pF. Here the  $C_i$  is treated as  $C_{sink}$ , the load capacitance of a sink device.

Fixing the maximum transition time from Table 4,  $T = 1 \mu\text{s}$ , and using the k values from Table 4, the recommended maximum total resistance of the pullup resistors on an I<sup>2</sup>C bus can be calculated for different system setups.

To support the maximum load capacitance specified in the HDMI specification,  $C_{cable(max)} = 700 \text{ pF}/C_{source} = 50 \text{ pF}/C_i = 50 \text{ pF}$ ,  $R_{(max)}$  can be calculated as shown in Table 5.

**Table 5. Pullup Resistors for Different Threshold Voltages and 800-pF Load**

V <sub>th-</sub> -V <sub>th+</sub>	0.7 V <sub>DD</sub>	0.65 V <sub>DD</sub>	0.6 V <sub>DD</sub>	0.55 V <sub>DD</sub>	0.5 V <sub>DD</sub>	0.45 V <sub>DD</sub>	0.4 V <sub>DD</sub>	0.35 V <sub>DD</sub>	0.3 V <sub>DD</sub>	UNIT
0.1 V <sub>DD</sub>	1.14	1.32	1.54	1.80	2.13	2.54	3.08	3.84	4.97	k $\Omega$
0.15 V <sub>DD</sub>	1.20	1.41	1.66	1.97	2.36	2.87	3.59	4.66	6.44	k $\Omega$
0.2 V <sub>DD</sub>	1.27	1.51	1.80	2.17	2.66	3.34	4.35	6.02	9.36	k $\Omega$
0.25 V <sub>DD</sub>	1.36	1.64	1.99	2.45	3.08	4.03	5.60	8.74	18.12	k $\Omega$
0.3 V <sub>DD</sub>	1.48	1.80	2.23	2.83	3.72	5.18	8.11	16.87	—	k $\Omega$

Or, limiting the maximum load capacitance of each cable to 400 pF to accommodate with I<sup>2</sup>C specification version 2.1,  $C_{cable(max)} = 400 \text{ pF}/C_{source} = 50 \text{ pF}/C_i = 50 \text{ pF}$ ; the maximum values of  $R_{(max)}$  are calculated as shown in Table 6.

**Table 6. Pullup Resistor Upon Different Threshold Voltages and 500-pF Loads**

V <sub>th-</sub> -V <sub>th+</sub>	0.7 V <sub>DD</sub>	0.65 V <sub>DD</sub>	0.6 V <sub>DD</sub>	0.55 V <sub>DD</sub>	0.5 V <sub>DD</sub>	0.45 V <sub>DD</sub>	0.4 V <sub>DD</sub>	0.35 V <sub>DD</sub>	0.3 V <sub>DD</sub>	UNIT
0.1 V <sub>DD</sub>	1.82	2.12	2.47	2.89	3.40	4.06	4.93	6.15	7.96	k $\Omega$
0.15 V <sub>DD</sub>	1.92	2.25	2.65	3.14	3.77	4.59	5.74	7.46	10.30	k $\Omega$
0.2 V <sub>DD</sub>	2.04	2.42	2.89	3.48	4.26	5.34	6.95	9.63	14.98	k $\Omega$
0.25 V <sub>DD</sub>	2.18	2.62	3.18	3.92	4.93	6.45	8.96	13.98	28.99	k $\Omega$
0.3 V <sub>DD</sub>	2.36	2.89	3.57	4.53	5.94	8.29	12.97	26.99	—	k $\Omega$

Obviously, to accommodate the 3-mA drive current specification, a narrower threshold voltage range is required to support a maximum 800-pF load capacitance for a standard-mode I<sup>2</sup>C bus.

When the input low- and high-level threshold voltages, V<sub>th-</sub> and V<sub>th+</sub>, are 0.7 V and 1.9 V, respectively, which is 0.15 V<sub>DD</sub> and 0.4 V<sub>DD</sub>, approximately, then with V<sub>DD</sub> = 5 V from Table 5, the maximum pullup resistor is 3.59 k $\Omega$ . The allowable pullup resistor is in the range of 1.83 k $\Omega$  and 3.59 k $\Omega$ .

## HPD Pins

The HPD circuits are powered by the 3.3-V VCC supply. This provides maximum V<sub>OH</sub> = VCC and maximum V<sub>OL</sub> = 0.4-V output signals to the SOURCE with a typical 1-k $\Omega$  output resistance. An external 1-k $\Omega$  resistor is not needed here. The HPD output of the selected source port follows the logic level of the HPD\_SINK input. Unselected HPD outputs are kept low. When the device is in standby mode, all HPD outputs follow HPD\_SINK.

If V<sub>OH</sub> greater than VCC is desired, then an external circuit as shown in Figure 45 can be used. In this case, the maximum V<sub>OH</sub> can be equal to the 5 V coming from the HDMI source.

VCC	HPD_SINK	HPD[1:2]	HPD_SOURCE
ON	L	H	L
ON	H	L	H
OFF	X	Z	H

Figure 45. External Circuit to Drive 5-V  $V_{OH}$  on HPD[1:2]

## Layout Considerations

The high-speed differential TMDS inputs are the most critical paths for the TMDS261B. There are several considerations to minimize discontinuities on these transmission lines between the connectors and the device:

- Maintain 100-Ω differential transmission-line impedance into and out of the TMDS261B.
- Keep an uninterrupted ground plane beneath the high-speed I/Os.
- Keep the ground-path vias to the device as close as possible to allow the shortest return current path.
- Keep the trace lengths of the TMDS signals between connector and device as short as possible.
- Keep intra-pair skew (trace length) between the positive and negative TMDS inputs matched to within 5 mils (0.005 inches or 0.127 mm).

## Using the TMDS261B in Systems with Different CEC Link Requirements

The TMDS261B supports a DTV with up to two HDMI inputs when used in conjunction with a signal-port HDMI receiver. Figure 46 and Figure 47 through Figure 49 show simplified application block diagrams for the TMDS261B in different DTVs with different consumer electronic control (CEC) requirements. The CEC is an optional feature of the HDMI interface for centralizing and simplifying user control instructions from multiple audio/video products in an interconnected system, even when all the audio/video products are from different manufacturers. This feature minimizes the number of remote controls in a system, as well as reducing the number of times buttons must be pressed.

### A DTV Supporting a Passive CEC Link

In Figure 46, the DTV does not have the capability of handling CEC signals, but allows CEC signals to pass over the CEC bus. The source selection is done by the control command of the DTV. The user cannot force the command from any audio/video product on the CEC bus. The selected source reads the E-EDID data after receiving an asserted HPD signal. The microcontroller loads different CEC physical addresses while changing the source by means of the S1 and S2 pins.

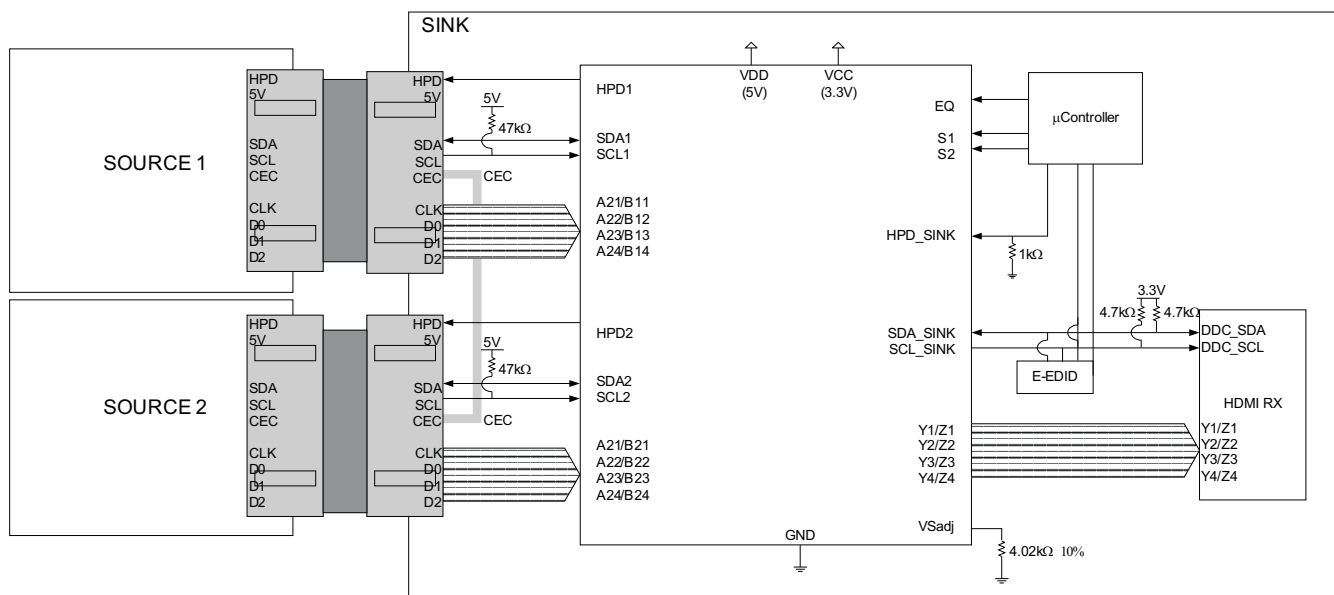

### E-EDID Reading Configurations in Standby Mode

When the DTV system is in standby mode, the sources do not read the E-EDID memory because the 1-k $\Omega$  pulldown resistor keeping the HPD\_SINK input at logic low forces all HPD pins to output logic-low to all sources. The source does not read the E-EDID data with a low on HPD signal. However, if reading the E-EDID data in the system standby mode is preferred, then TMDS261B can still support this need.

The recommended configuration sequences are:

1. Apply the same 3.3-V power to the VCC of TMDS261B and the TMDS line termination at the HDMI receiver.
2. Because the TMDS261B has clock-detect circuitry and there is no valid input TMDS clock in the standby mode, TMDS261B draws significantly less current.
3. Set S1 and S2 to select the source port which is allowed to read the E-EDID memory.

Note that if the source has a time-out limitation between the 5-V and the HPD signals, the foregoing configuration is not applicable. Uses individual EEPROMs assigned for each input port, see [Figure 47](#) through [Figure 49](#). The solution uses E-EDID data to be readable during system power-off or standby-mode operations.

**Figure 46. Two-Port HDMI-Enabled DTV With TMDS261B – CEC Commands Passing Through**

## A DTV Supporting an Active CEC Link

In [Figure 47](#), the CEC PHY and CEC LOGIC functions are added. The DTV can initiate and/or react to CEC signals from its remote control or other audio/video products on the same CEC bus. All sources must have their own CEC physical address to support the full functionality of the CEC link.

A source reads its CEC physical address stored in its E-EDID memory after receiving a logic-high from the HPD feedback. When HPD is high, the sink-assigned CEC physical address should be maintained. Otherwise, when HPD is low, the source sets the CEC physical address value to (F.F.F.F).

### Case 1 – AC-Coupled Source (See [Figure 47, Port 1](#))

When the source TMDS lines are ac-coupled or when the source cannot detect the TMDS termination provided in the connected sink, the indication of the source selection can only come from the HPD signal. The TMDS261B HPD1 pin should be applied directly as the HPD signal back to the source.

### Case 2 – DC-Coupled Source (See [Figure 48, Port 2](#))

When the source TMDS lines are dc-coupled, there are two methods to inform the source that it is the active source to the sink. One is checking the HPD signal from the sink, and the other is checking the termination condition in the sink.

In full-CEC operation mode, the HPD signal is set high whether the port is selected or not. The source loads and maintains the CEC physical address when HPD is high. As soon as HPD goes low, the source loses the CEC physical address. To keep the CEC physical address to the source, the HPD signal loops back from the source-provided 5-V signal through a 1-k $\Omega$  pullup resistor in the sink. This method is acceptable in applications where the HDMI transmitter can detect the receiver termination by current sensing and the receiver has a switchable termination on the TMDS inputs. The internal termination resistors are connected to the termination voltage when the port is selected, or they are disconnected when the port is not selected. The TMDS261B features switchable termination on the TMDS inputs.

### Case 3 – External Logic Control for HPD (See [Figure 49, Port 3](#))

When the HDMI transmitter does not have the capability of detecting the receiver termination, using the HPD signal as a reference for sensing port selections is the only possible method. External control logic for switching the connections of the HPD signals between the HPD pins of the TMDS261B and the 5-V signal from the source provides a good solution.

### *E-EDID Reading Configurations in Standby Mode*

When the TMDS261B is in standby-mode operation, S1 = H and S2 = L, all sources can read their E-EDID memories simultaneously with all HPD pins following HPD\_SINK in logic-high. HPD\_SINK input low prevents E-EDID reading in standby-mode operation. (See [Figure 47](#) through [Figure 49](#))

### I<sup>2</sup>C INTERFACE NOTES

The I<sup>2</sup>C interface is used to access the internal registers of the TMDS261B. I<sup>2</sup>C is a two-wire serial interface developed by Philips Semiconductor (see I<sup>2</sup>C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I<sup>2</sup>C-compatible devices connect to the I<sup>2</sup>C bus through open-drain I/O pins, SDA and SCL. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device. The TMDS261B works as a slave and supports standard-mode transfer (100 kbps).

The basic I<sup>2</sup>C start and stop access cycles are shown in Figure 50.

The basic access cycle consists of the following:

- A start condition
- A slave address cycle
- Any number of data cycles
- A stop condition

T0393-01

Figure 50. I<sup>2</sup>C Start and Stop Conditions

## GENERAL I<sup>2</sup>C PROTOCOL

- The *master* initiates data transfer by generating a *start condition*. The *start condition* is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 50. All I<sup>2</sup>C-compatible devices should recognize a *start condition*.
- The master then generates the SCL pulses and transmits the 7-bit address and the *read/write direction bit* R/W on the SDA line. During all transmissions, the master ensures that data is *valid*. A *valid data* condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 51). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an *acknowledge* (see Figure 52) by driving the SDA line low during the entire high period of the ninth SCL cycle. On detecting this acknowledge, the master knows that a communication link with a slave has been established.
- The master generates further SCL cycles to either *transmit* data to the slave (R/W bit 0) or *receive* data from the slave (R/W bit 1). In either case, the *receiver* must acknowledge the data sent by the *transmitter*. So an acknowledge signal can be generated either by the master or by the slave, depending on which one is the receiver. The 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary (See Figure 54 through Figure 57).
- To signal the end of the data transfer, the master generates a *stop condition* by pulling the SDA line from low to high while the SCL line is high (see Figure 50). This releases the bus and stops the communication link with the addressed slave. All I<sup>2</sup>C compatible devices must recognize the stop condition. Upon the receipt of a *stop condition*, all devices know that the bus is released, and they wait for a *start condition* followed by a matching address.

**Figure 51. I<sup>2</sup>C Bit Transfer**

**Figure 52. I<sup>2</sup>C Acknowledge**

Figure 53. I<sup>2</sup>C Address, Data Cycle(s), and Stop

During a write cycle, the transmitting device must not drive the SDA signal line during the acknowledge cycle so that the receiving device may drive the SDA signal low. After each byte transfer following the address byte, the receiving device pulls the SDA line low for one SCL clock cycle. A stop condition is initiated by the transmitting device after the last byte is transferred. An example of a write cycle can be found in Figure 54 and Figure 55. Note that the TMDS261B allows multiple write transfers to occur. See the *Example – Writing to the TMDS261* section for more information.

During a read cycle, the slave receiver acknowledges the initial address byte if it decodes the address as its address. Following this initial acknowledge by the slave, the master device becomes a receiver and acknowledges data bytes sent by the slave. When the master has received all of the requested data bytes from the slave, the not-acknowledge (A) condition is initiated by the master by keeping the SDA signal high just before it asserts the stop (P) condition. This sequence terminates a read cycle as shown in Figure 56 and Figure 57. See the *Example – Reading from the TMDS261* section for more information.

Figure 54. I<sup>2</sup>C Write Cycle

Figure 55. Multiple-Byte Write Transfer

Figure 56. I<sup>2</sup>C Read Cycle

**Figure 57. Multiple-Byte Read Transfer**

**Slave Address**

Both SDA and SCL must be connected to a positive supply voltage via a pullup resistor. These resistors should comply with the I<sup>2</sup>C specification that ranges from 2 kΩ to 19 kΩ. When the bus is free, both lines are high. The address byte is the first byte received following the START condition from the master device. The 7-bit address is factory preset to 0101 100. Table 7 lists the calls that the TMDS261B responds to.

**Table 7. TMDS261B Slave Address**

FIXED ADDRESS							READ/WRITE BIT
Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (R/W)
0	1	0	1	1	0	0	1/0

**EXAMPLE – WRITING TO THE TMDS261B**

The proper way to write to the TMDS261B is illustrated as follows:

An I<sup>2</sup>C master initiates a write operation to the TMDS261B by generating a start condition (S) followed by the TMDS261B I<sup>2</sup>C address (as shown following, in MSB-first bit order, followed by a 0 to indicate a write cycle. After receiving an acknowledge from the TMDS261B, the master presents the subaddress (sink port) to be written, consisting of one byte of data, MSB-first. The TMDS261B acknowledges the byte after completion of the transfer. Finally, the master presents the data to be written to the register (sink port), and the TMDS261B acknowledges the byte. The master can continue presenting data to be written after TMDS261B acknowledges the previous byte (steps 6, 7). After the last byte to be written has been acknowledged by TMDS261B, the I<sup>2</sup>C master then terminates the write operation by generating a stop condition (P).

<b>Step 1</b>	<b>0</b>
I <sup>2</sup> C start (master)	S

<b>Step 2</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
I <sup>2</sup> C general address (master)	0	1	0	1	1	0	0	0

<b>Step 3</b>	<b>8</b>
I <sup>2</sup> C acknowledge (slave)	A

<b>Step 4</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>

Data is the register address or register data to be written

<b>Step 7</b>	<b>8</b>
I <sup>2</sup> C acknowledge (slave)	A

<b>Step 8</b>	<b>0</b>
I <sup>2</sup> C stop (master)	P

An example of the proper bit control for selecting port 2 is:

Step 4: 0000 0001

Step 6: 1001 0000

### EXAMPLE – READING FROM THE TMDS261B

The read operation consists of two phases. The first phase is the address phase. In this phase, an I<sup>2</sup>C master initiates a write operation to the TMDS261B by generating a start condition (S) followed by the TMDS261B I<sup>2</sup>C address, in MSB-first bit order, followed by a 0 to indicate a write cycle. After receiving acknowledges from the TMDS261B, the master presents the subaddress of the register to be read. After the cycle is acknowledged (A), the master may optionally terminate the cycle by generating a stop condition (P).

The second phase is the data phase. In this phase, an I<sup>2</sup>C master initiates a read operation to the TMDS261B by generating a start condition followed by the TMDS261B I<sup>2</sup>C address (as shown following for a read operation), in MSB first bit order, followed by a 1 to indicate a read cycle. After an acknowledge from the TMDS261B, the I<sup>2</sup>C master receives one byte of data from the TMDS261B. The master can continue receiving data bytes by issuing an acknowledge after each byte read (steps 10, 11). After the last data byte has been transferred from the TMDS261B to the master, the master generates a not-acknowledge followed by a stop.

#### TMDS261B Read Phase 1

TMDS261BPAG	ACTIVE	TQFP	PAG	64	160	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	
TMDS261BPAGR	ACTIVE	TQFP	PAG	64	1500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - D. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
