### 1 INTRODUCTION

#### 1.1 Features

- Power Management Core
  - Linear Charger
    - Three Charger Phases: Pre-charge, Fast Charge, and Charge Termination
    - LED Current Sinks for Power Good and Charger Status Indication
  - LDO Supply for External Modules & Integrated MSP430 Power
  - Boost Converter
    - Adjustable Output Voltage: 8 V to 16 V
  - Full H-Bridge Analog Switches
    - Internally Controlled by MSP430 Core for System Functions
- MSP430 Core
  - Ultralow Power Consumption
    - Active Mode: 280  $\mu$ A at 1 MHz, 2.2 V
    - Standby Mode: 0.5  $\mu$ A
    - Off Mode (RAM Retention): 0.1  $\mu$ A
  - Five Power-Saving Modes
- 16-Bit RISC Architecture
- 16 kB Flash
- Two 16-Bit Timer\_A Modules With Three Capture/Compare Registers
- 10-Bit 200-ksps A/D Converter With Internal Reference, Sample-and-Hold, and Autoscan
- Universal Serial Communications Interface, Supports IrDA Encode/Decode and Synchronous SPI
  - Enhanced UART Supporting Auto Baudrate Detection (LIN)
  - IrDA Encoder and Decoder
  - Synchronous SPI
  - I<sup>2</sup>C™
- Serial Onboard Programming
  - No External Programming Voltage Needed
  - Programmable Code Protection by Security Fuse
- For Complete Module Descriptions, See the *MSP430x2xx Family User's Guide* ([SLAU144](#))

#### 1.2 Description

The TPS65835 is a PMU for active shutter 3D glasses consisting of a power management core and an MSP430 microcontroller. The power management core has an integrated power path, linear charger, LDO, boost converter, and full H-bridge analog switches for left and right shutter operation in a pair of active shutter 3D glasses. The MSP430 core supports the synchronization and communications from an IR, RF, or other communications module through the integrated universal serial communications and timer interfaces for operation of the H-bridge switches on the power management core.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

I<sup>2</sup>C is a trademark of Phillips.

<b>MISC. AND PACKAGE</b>			
Thermal PAD	-	41	There is an internal electrical connection between the exposed thermal pad and the AGND ground pin of the device. The thermal pad must be connected to the same potential as the AGND pin on the printed circuit board. Do not use the thermal pad as the primary ground input for the device. AGND pin must be connected to ground at all times.
N/C	-	10, 40	All N/C pins are not connected internally (package to die). They should be connected to the main system ground.

(2) TDO or TDI is selected via JTAG instruction.

(3) If P2.7 is used as an input, excess current will flow until P2SEL.7 is cleared. This is due to the oscillator output driver connection to this pad after reset.

(4) MSP430 ground and grounds for PMIC (Power Management Core) are connected internally.

**Table 1-2. Pin Absolute Maximum Ratings**

PIN	VALUE / UNIT
Input voltage range on all pins (except for VIN, BST_OUT, BST_SW, BST_FB, VLDO, LCLP, LCLN, LCRP, LCRN, AGND, DGND, PGND, BST, and MSP430 Core pins) with respect to AGND	-0.3 V to 7.0 V
VIN with respect to AGND	-0.3 V to 28.0 V
BST_OUT, BST_SW with respect to PGND, BST	-0.3 V to 18.0 V
BST_FB with respect to PGND, BST, VLDO with respect to DGND	-0.3 V to 3.6 V
MSP430 Core Pins	-0.3 V to 4.1 V

### 1.5 Package Pin Assignments

Pins 10 & 40 = N/C. No internal connection, connect to main system ground.

$V_{IH(PMIC)}$	GPIO high level (BST_EN, CHG_EN, SW_SEL, VLDO_SET and to switch H-Bridge inputs to a high, 1, level)	1.2			V

(1) VIN pin has 28 V ESD protection

(2) See [Section 2.9](#) for information on boost converter inductor selection.

(3) Design optimized for boost operation with 10  $\mu$ H inductor

### 2.2 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

PARAMETER	MINIMUM	MAXIMUM	UNITS
Operating free-air temperature, $T_A$	0	60	$^{\circ}$ C
Max Junction Temperature, $T_J$ , Electrical Characteristics Guaranteed	0	85	$^{\circ}$ C
Max Junction temperature, $T_J$ , Functionality Guaranteed <sup>(1)</sup>	0	105	$^{\circ}$ C

(1) Device has a thermal shutdown feature implemented that shuts down at 105  $^{\circ}$ C

## 2.3 Thermal Information

THERMAL METRIC		TPS65835	UNITS
		RKP	
		40 PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance <sup>(1)</sup>	31.9	°C/W
$\theta_{JcTop}$	Junction-to-case (top) thermal resistance <sup>(2)</sup>	22.7	
$\theta_{JB}$	Junction-to-board thermal resistance <sup>(3)</sup>	6.2	
$\Psi_{JT}$	Junction-to-top characterization parameter <sup>(4)</sup>	0.3	
$\Psi_{JB}$	Junction-to-board characterization parameter <sup>(5)</sup>	6.1	
$\theta_{JcBot}$	Junction-to-case (bottom) thermal resistance <sup>(6)</sup>	1.4	

- (1) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (2) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (3) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (4) The junction-to-top characterization parameter,  $\Psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (5) The junction-to-board characterization parameter,  $\Psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## 2.4 Quiescent Current

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{Q(SLEEP)}$	Power management core quiescent current in sleep mode	@ 25° C $V_{BAT} = 3.6\text{ V}$ $V_{VIN} = 0\text{ V}$ No load on LDO CHG_EN, BST_EN grounded BST_FB = 300 mV Power management core in sleep mode / device 'off'		8.6	10.5	$\mu\text{A}$

## 2.6 System Operation

The system must complete the power up routine before it enters normal operating mode. The specific system operation depends on the setting defined by the state of the SW\_SEL pin. The details of the system operation for each configuration of the SW\_SEL pin are contained in this section.

### 2.6.1 System Power Up

### 2.6.2 System Operation Using Push Button Switch

Figure 2-2. Push Button State Diagram

### 2.6.3 System Operation Using Slider Switch

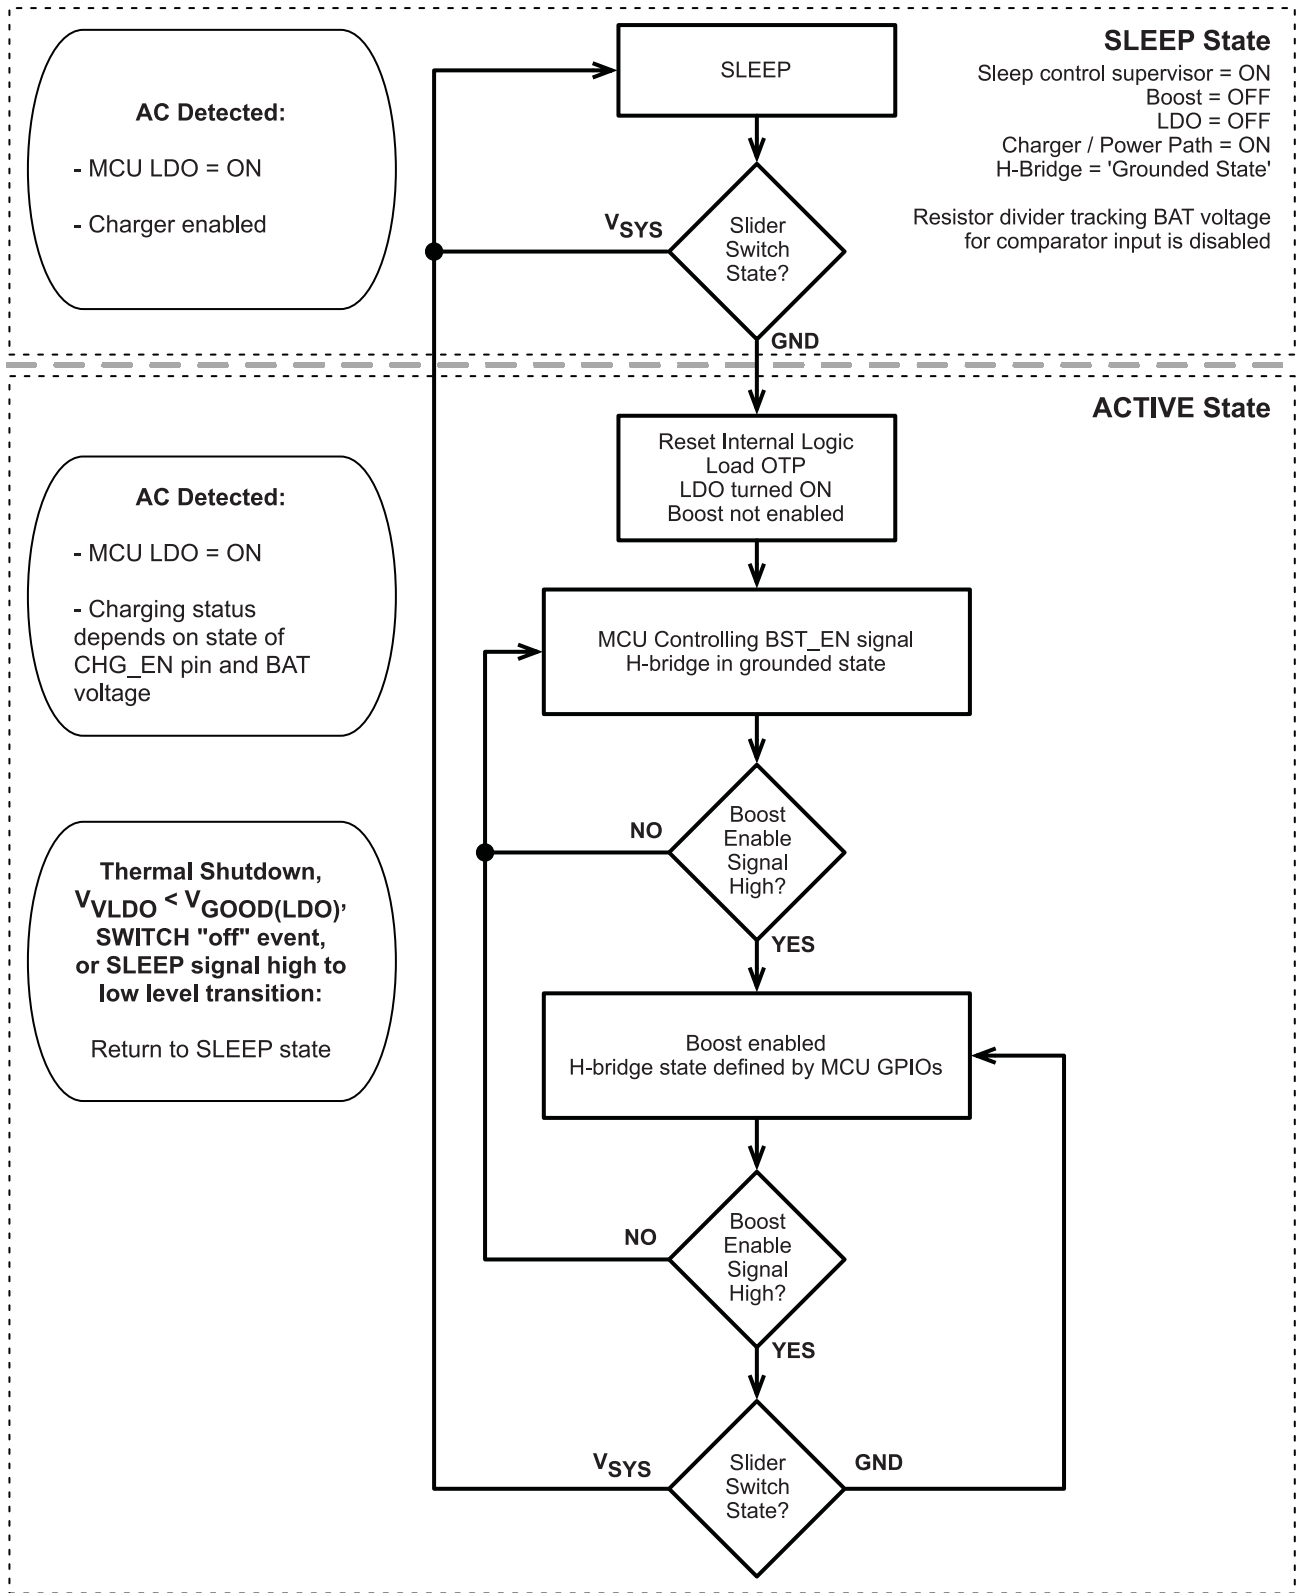

Figure 2-3. System Operation Using Slider Switch

## 2.7 Linear Charger Operation

This device has an integrated Li-Ion battery charger and system power path management feature targeted at space-limited portable applications. The architecture powers the system while simultaneously and independently charging the battery. This feature reduces the number of charge and discharge cycles on the battery, allows for proper charge termination, and enables the system to run with a defective or absent battery pack. It also allows instant system turn-on even with a totally discharged battery.

The input power source for charging the battery and running the system can be an AC adapter or USB port connected to the VIN pin as long as the input meets the device operating conditions outlined in this datasheet. The power-path management feature automatically reduces the charging current if the system load increases. Note that the charger input, VIN, has voltage protection up to 28 V.

### 2.7.1 Battery and TS Detection

To detect and determine between a good or damaged battery, the device checks for a short circuit on the BAT pin by sourcing  $I_{BAT(SC)}$  to the battery and monitoring the voltage on the BAT pin. While sourcing this current if the BAT pin voltage exceeds  $V_{BAT(SC)}$ , a battery has been detected. If the voltage stays below the  $V_{BAT(SC)}$  level, the battery is presumed to be damaged and not safe to charge.

The device will also check for the presence of a 10 k $\Omega$  NTC thermistor attached to the TS pin of the device. The check for the NTC thermistor on the TS pin is done much like the battery detection feature described previously. The voltage on the TS pin is compared against a defined level and if it is found to be above the threshold, the NTC thermistor is assumed to be disconnected or not used in the system. To reduce the system quiescent current, the NTC thermistor temperature sensing function is only enabled when the device is charging and when the thermistor has been detected.

Figure 2-4. Thermistor Detection and Circuit

### 2.7.2 Battery Charging

The battery is charged in three phases: conditioning pre-charge, constant-current fast charge (current regulation), and a constant-voltage tapering (voltage regulation). In all charge phases, an internal control loop monitors the IC junction temperature and reduces the charge current if an internal temperature threshold is exceeded. [Figure 2-5](#) shows what happens in each of the three charge phases:

Figure 2-5. Battery Charge Phases

In the pre-charge phase, the battery is charged with the pre-charge current that is scaled to be 10% of the fast-charge current set by the resistor connected to the ISET pin. Once the battery voltage crosses the  $V_{LOWV}$  threshold, the battery is charged with the fast-charge current ( $I_{CHG}$ ). As the battery voltage reaches  $V_{BAT(REG)}$ , the battery is held at a constant voltage of  $V_{BAT(REG)}$  and the charge current tapers off as the battery approaches full charge. When the battery current reaches  $I_{TERM}$ , the charger indicates charging is done by making the nCHG\_STAT pin high impedance. Note that termination detection is disabled whenever the charge rate is reduced from the set point because of the actions of the thermal loop, the DPM loop, or the  $V_{IN(LOWV)}$  loop.

### 2.7.2.1 Pre-charge

The value for the pre-charge current is set to be 10% of the charge current that is set by the external resistor,  $R_{ISET}$ . Pre-charge current is scaled to lower currents when the charger is in thermal regulation.

### 2.7.2.2 Charge Termination

In the fast charge state, once  $V_{BAT} \geq V_{BAT(REG)}$ , the charger enters constant voltage mode. In constant voltage mode, the charge current will taper until termination when the charge current falls below the  $I_{(TERM)}$  threshold (typically 10% of the programmed fast charge current). Termination current is not scaled when the charger is in thermal regulation. When the charging is terminated, the nCHG\_STAT pin will be high impedance (effectively turning off any LED that is connected to this pin).

### 2.7.2.3 Recharge

Once a charge cycle is complete and termination is reached, the battery voltage is monitored. If  $V_{BAT} < V_{BAT(REG)} - V_{RCH}$ , the device determines if the battery has been removed. If the battery is still present, then the recharge cycle begins and will end when  $V_{BAT} \geq V_{BAT(REG)}$ .

### 2.7.2.4 Charge Timers

The charger in this device has internal safety timers for the pre-charge and fast charge phases to prevent potential damage to either the battery or the system. The default values for these timers are found as follows: Pre-charge timer = 0.5 hours (30 minutes) and Fast charge timer = 5 hours (300 minutes).

During the fast charge phase, the following events may increase the timer durations:

1. The system load current activates the DPM loop which reduces the available charging current
2. The input current is reduced because the input voltage has fallen to  $V_{IN(Low)}$
3. The device has entered thermal regulation because the IC junction temperature has exceeded  $T_{J(REG)}$

During each of these events, the internal timers are slowed down proportionately to the reduction in charging current.

If the pre-charge timer expires before the battery voltage reaches  $V_{LOWV}$ , the charger indicates a fault condition.

### 2.7.3 Charger Status (nCHG\_STAT Pin)

The nCHG\_STAT pin is used to indicate the charger status by an externally connected resistor and LED circuit. The pin is an open drain input and the internal switch is controlled by the logic inside of the charger. This pin may also be connected to a GPIO of the system MCU to indicate charging status. The table below details the status of the nCHG\_STAT pin for various operating states of the charger.

**Table 2-1. nCHG\_STAT Functionality**

Charging Status	nCHG_STAT FET / LED
Pre-charge / Fast Charge / Charge Termination	ON
Recharge	OFF
OVP	OFF
SLEEP	OFF

## 2.8 LDO Operation

The power management core has a low dropout linear regulator (LDO) with variable output voltage capability. This LDO is used for supplying the microcontroller and may be used to supply either an external IR or RF module, depending on system requirements. The LDO can supply a continuous current of up to 30 mA.

The output voltage ( $V_{VLDO}$ ) of the LDO is set by the state of the VLDO\_SET pin. See [Table 2-2](#) for details on setting the LDO output voltage.

**Table 2-2. VLDO\_SET Functionality**

VLDO_SET State	VLDO Output Voltage ( $V_{VLDO}$ )
Low ( $VLDO\_SET < V_{IL(PMIC)}$ )	2.2 V
High ( $VLDO\_SET > V_{IH(PMIC)}$ )	3.0 V

### 2.8.1 LDO Internal Current Limit

The internal current limit feature helps to protect the LDO regulator during fault conditions. During current limit, the output sources a fixed amount of current that is defined in the electrical specification table. The voltage on the output in this stage can not be regulated and will be  $V_{OUT} = I_{LIMIT} \times R_{LOAD}$ . The pass transistor integrated into the LDO will dissipate power,  $(V_{IN} - V_{OUT}) \times I_{LIMIT}$ , until the device enters thermal shutdown. In thermal shutdown the device will enter the "SLEEP / POWER OFF" state which means that the LDO will then be disabled and shut off.

## 2.9 Boost Converter Operation

The boost converter in this device is designed for the load of active shutter 3D glasses. This load is typically a light load where the average current is 2 mA or lower and the peak current out of a battery is limited in operation. This asynchronous boost converter operates with a minimum off time / maximum on time for the integrated low side switch, these values are specified in the electrical characteristics table of this datasheet.

The peak output voltage from the boost converter is adjustable and set by using an external resistor divider connected between BST\_OUT, the BST\_FB pin, and ground. The peak output voltage is set by choosing resistors for the feedback network such that the voltage on the BST\_FB pin is  $V_{REF(BST)} = 1.2\text{ V}$ . See Section 4.2 for more information on calculating resistance values for this feedback network.

The efficiency curves for various input voltages over the typical 3D glasses load range (2 mA and lower) are shown below. All curves are for a target  $V_{OUT}$  of 16 V. For output voltages less than 16 V, a higher efficiency at each operating input voltage should be expected. Note that efficiency is dependent upon the external boost feedback network resistances, the inductor used, and the type of load connected.

Figure 2-7. Boost Efficiency vs.  $I_{OUT}$ ,  $V_{IN} = 3.7\text{ V}$ ,  $V_{OUT} = 16\text{ V}$

Figure 2-8. Boost Efficiency vs.  $I_{OUT}$ ,  $V_{IN} = 4.2\text{ V}$ ,  $V_{OUT} = 16\text{ V}$

Figure 2-9. Boost Efficiency vs.  $I_{OUT}$ ,  $V_{IN} = 5.5\text{ V}$ ,  $V_{OUT} = 16\text{ V}$

### 2.9.1 Boost Thermal Shutdown

An internal thermal shutdown mode is implemented in the boost converter that shuts down the device if the typical junction temperature of 105°C is exceeded. If the device is in thermal shutdown mode, the main switch of the boost is open and the device enters the "SLEEP / POWER OFF" state.

## 2.9.2 Boost Load Disconnect

When the boost is disabled (BST\_EN = LOW), the H-bridge is automatically placed into the OFF state. In the OFF state the high side H-bridge switches are open and the low side switches of the H-bridge are closed. The OFF state grounds and discharges the load, potentially prolonging the life of the LC shutters by eliminating any DC content (see Section 2.10.1 for more information regarding the H-bridge states). The disconnection of the load is done with the H-Bridge and can be seen in the next figure (Figure 2-10).

**Figure 2-10. Boost Load Disconnect**

An advantage to this topology for disconnecting the load is that the boost output capacitor is charged to approximately the SYS voltage level, specifically  $V_{SYS} - V_{DIODE(BST)}$ , when the boost is disabled. This design ensures that there is not a large in-rush current into the boost output capacitor when the boost is enabled. The boost operation efficiency is also increased because there is no load disconnect switch in the boost output path, such a switch would decrease efficiency because of the resistance that it would introduce.

## 2.10 Full H-Bridge Analog Switches

The TPS65835 has two integrated full H-bridge analog switches that are connected to GPIO ports on the MSP430 and can be controlled by the MSP430 core for various system functions. There is an internal level shifter that takes care of the input signals to the H-Bridge switches.

### 2.10.1 H-Bridge Switch Control

The H-Bridge switches are controlled by the MSP430 core for system operation - specifically to control charge polarity on the LCD shutters. Depending on the state of the signals from the MSP430 core, the H-Bridge will be put into 4 different states. These states are:

- **OPEN:** All Switches Opened
- **CHARGE+:** Boost Output Voltage Present on Pins LCLP or LCRP
- **CHARGE-:** Boost Output Voltage Present on Pins LCLN or LCRN
- **GROUNDED:** High side switches are opened and low side switches are closed

If CHARGE+ state is followed by the CHARGE- state, the voltage across the capacitor connected to the H-Bridge output terminals will be reversed. The system is automatically put into the GROUNDED state when the boost is disabled by the BST\_EN pin - for more details see [Section 2.6](#).

## 2.11 Power Management Core Control

The power management core is controlled with external pins that can set system behavior by their status along with internal connections to GPIOs from the MSP430 that can be modified depending on the code implemented in the MSP430.

### 2.11.1 SLEEP / Power Control Pin Function

The internal SLEEP signal between the power management device and the MSP430 can be used to control the power down behavior of the device. This has multiple practical applications such as a watchdog implementation for the communication between the sender (TV) and the 3D glasses (receiver) or different required system on and off times; typically when the push-button press timing for an off event is a few seconds in length, programmable by software in the system MCU.

If there is a requirement that the push-button press for system on and off events are different, the SLEEP signal must be set to a logic high value ( $V_{SLEEP} > V_{IH(PMIC)}$ ) upon system startup. This implementation allows the device to power down the system on the falling edge of the SLEEP signal (when:  $V_{SLEEP} < V_{IL(PMIC)}$ ).

Figure 2-13. SLEEP Signal to Force System Power Off

### 2.11.2 COMP Pin Functionality

The COMP pin is used to output a scaled down voltage level related to the battery voltage for input to the comparator of the MSP430. Applications for this COMP feature could be to generate an interrupt on the MSP430 when the battery voltage drops under a threshold and the device can then be shut down or indicate to the end user with an LED that the battery requires charging.

Figure 2-14. COMP Pin Internal Connection

**Table 2-4. Scaling Resistors for COMP Pin Function**  
( $V_{VLDO} = 2.2\text{ V}$ )

Scaling Resistors for COMP Pin Function	Value
$R_{BSC1}$	3.0 M $\Omega$
$R_{BSC2}$	2.36 M $\Omega$

**Table 2-5. Scaling Resistors for COMP Pin Function**  
( $V_{VLDO} = 3.0\text{ V}$ )

Scaling Resistors for COMP Pin Function	Value
$R_{BSC1}$	3.0 M $\Omega$
$R_{BSC2}$	2.48 M $\Omega$

Using the designed values in [Table 2-4](#) or [Table 2-5](#), the voltage on the COMP pin will be:  $V_{COMP} = 0.5 \times V_{VLDO} + 300\text{ mV}$ . This assures that the COMP pin voltage will be close to half of the LDO output voltage plus the LDO dropout voltage of the device. The COMP pin can also be used as an input to ADC channel A0 of the integrated MSP430 microcontroller. This is useful if greater measurement accuracy or increased functionality is desired from this function.

### 2.11.3 SW\_SEL Pin Functionality

The SW\_SEL pin is used to select what type of switch is connected to the SWITCH pin of the device. Selection between a push-button and a slider switch can be made based on the state of this pin.

**Table 2-6. SW\_SEL Settings**

SW_SEL State	Type of Switch Selected
Low ( $V_{SW\_SEL} < V_{IL(PMIC)}$ )	Slider Switch
High ( $V_{SW\_SEL} > V_{IH(PMIC)}$ )	Push-button

When the push button switch type is selected, the device will debounce the SWITCH input with a 32 ms timer for both the ON and OFF events and either power on or off the device. Using the push-button switch function, the ON and OFF timings are equal;  $t_{ON} = t_{OFF}$ . If the system requirements are such that the on and off timings should be different,  $t_{ON} \neq t_{OFF}$ , then refer to the following section for the correct system setup: [Section 4.3](#). When the slider switch operation is selected, the SWITCH pin must be externally pulled up to the SYS voltage with a resistor and the output connected to the slider switch. When the SWITCH pin is pulled to ground, the device will turn on and enter the power up sequence.

### 2.11.4 SWITCH Pin

The SWITCH pin behavior is defined by the SW\_SEL pin ([Section 2.11.3](#)) which defines the type of switch that is connected to the system; either a slider switch or push-button.

### 2.11.5 Slider Switch Behavior

If a slider switch is connected in the system then the system power state and VLDO output (which powers the internal MSP430) is defined by the state of the slider switch. If the slider is in the "off" position then the SWITCH pin should be connected to the SYS pin. If the slider is in the "on" position then the SWITCH pin should be connected to ground. [Figure 2-15](#) details the system operation using the slider switch configuration.

Figure 2-15. SWITCH, Slider Power On-Off Behavior

#### 2.11.6 Push-Button Switch Behavior

The system is powered on or off by a push-button press after a press that is greater than 32 ms. The following figures (Figure 2-16 and Figure 2-17) show the system behavior and the expected VLDO output during the normal push-button operation where the ON and OFF press timings are the same value,  $t_{ON} = t_{OFF}$ .

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - Keep the trace between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
  - If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
  - Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.
- (2) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Since the PCB adds additional capacitance, it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (3) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (4) Measured with logic-level input frequency but also applies to operation with crystals.

V <sub>(RefVT)</sub> See Figure 3-21 and Figure 3-22	PCA0 = 1, CARSEL = 1, CAREF = 3, No load at CA0 and CA1, T <sub>A</sub> = 85°C	3 V		490		mV
V <sub>(offset)</sub> Offset voltage <sup>(2)</sup>		3 V		±10		mV
V <sub>(hys)</sub> Input hysteresis	CAON = 1	3 V		0.7		mV
t <sub>(response)</sub> Response time (low-high and high-low)	T <sub>A</sub> = 25°C, Overdrive 10 mV, Without filter: CAF = 0	3 V		120		ns
	T <sub>A</sub> = 25°C, Overdrive 10 mV, With filter: CAF = 1			1.5		μs

- (1) The leakage current for the Comparator\_A+ terminals is identical to I<sub>IKG(Px,y)</sub> specification.
- (2) The input offset voltage can be cancelled by using the CAEX bit to invert the Comparator\_A+ inputs on successive measurements. The two successive measurements are then summed together.

I <sub>REF+</sub>	Reference supply current, reference buffer disabled <sup>(3)</sup>	f <sub>ADC10CLK</sub> = 5.0 MHz, ADC10ON = 0, REF2_5V = 0, REFON = 1, REFOUT = 0	25°C	3 V	0.25		mA
		f <sub>ADC10CLK</sub> = 5.0 MHz, ADC10ON = 0, REF2_5V = 1, REFON = 1, REFOUT = 0			0.25		
I <sub>REFB,0</sub>	Reference buffer supply current with ADC10SR = 0 <sup>(3)</sup>	f <sub>ADC10CLK</sub> = 5.0 MHz, ADC10ON = 0, REFON = 1, REF2_5V = 0, REFOUT = 1, ADC10SR = 0	25°C	3 V	1.1		mA
I <sub>REFB,1</sub>	Reference buffer supply current with ADC10SR = 1 <sup>(3)</sup>	f <sub>ADC10CLK</sub> = 5.0 MHz, ADC10ON = 0, REFON = 1, REF2_5V = 0, REFOUT = 1, ADC10SR = 1	25°C	3 V	0.5		mA
C <sub>I</sub>	Input capacitance	Only one terminal Ax can be selected at one time	25°C	3 V		27	pF
R <sub>I</sub>	Input MUX ON resistance	0 V ≤ V <sub>Ax</sub> ≤ V <sub>CC</sub>	25°C	3 V	1000		Ω

(3) The leakage current is defined in the leakage current table with Px.y/Ax parameter.

(1) The analog input voltage range must be within the selected reference voltage range V<sub>R+</sub> to V<sub>R-</sub> for valid conversion results.

(2) The internal reference supply current is not included in current consumption parameter I<sub>ADC10</sub>.

(3) The internal reference current is supplied via terminal V<sub>CC</sub>. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables the built-in reference to settle before starting an A/D conversion.

### 3.1.29 10-Bit ADC, Built-In Voltage Reference

### 3.1.30 10-Bit ADC, External Reference<sup>(1)</sup>

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
VEREF+	Positive external reference input voltage range <sup>(1)</sup>	VEREF+ > VEREF–, SREF1 = 1, SREF0 = 0		1.4		V <sub>CC</sub>	V
		VEREF– ≤ VEREF+ ≤ V <sub>CC</sub> – 0.15 V, SREF1 = 1, SREF0 = 1 <sup>(2)</sup>		1.4		3	
VEREF–	Negative external reference input voltage range <sup>(3)</sup>	VEREF+ > VEREF–		0		1.2	V
ΔVEREF	Differential external reference input voltage range, ΔVEREF = VEREF+ – VEREF–	VEREF+ > VEREF– <sup>(4)</sup>		1.4		V <sub>CC</sub>	V
I <sub>VREF+</sub>	Static input current into VREF+	0 V ≤ VEREF+ ≤ V <sub>CC</sub> , SREF1 = 1, SREF0 = 0	3 V			±1	μA
		0 V ≤ VEREF+ ≤ V <sub>CC</sub> – 0.15 V ≤ 3 V, SREF1 = 1, SREF0 = 1 <sup>(2)</sup>	3 V			0	
I <sub>VREF–</sub>	Static input current into VREF–	0 V ≤ VEREF– ≤ V <sub>CC</sub>	3 V			±1	μA

- (1) The external reference is used during conversion to charge and discharge the capacitance array. The input capacitance, C<sub>i</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (1) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (2) Under this condition the external reference is internally buffered. The reference buffer is active and requires the reference buffer supply current I<sub>REFB</sub>. The current consumption can be limited to the sample and conversion period with REFBURST = 1.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits the minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.

### 3.1.31 10-Bit ADC, Timing Parameters

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
f <sub>ADC10CLK</sub>	ADC10 input clock frequency	For specified performance of ADC10 linearity parameters	3 V	0.45		6.3	MHz
		ADC10SR = 0 ADC10SR = 1		0.45		1.5	
f <sub>ADC10OSC</sub>	ADC10 built-in oscillator frequency	ADC10DIVx = 0, ADC10SSELx = 0, f <sub>ADC10CLK</sub> = f <sub>ADC10OSC</sub>	3 V	3.7		6.3	MHz
t <sub>CONVERT</sub>	Conversion time	ADC10 built-in oscillator, ADC10SSELx = 0, f <sub>ADC10CLK</sub> = f <sub>ADC10OSC</sub>	3 V	2.06		3.51	μs
		f <sub>ADC10CLK</sub> from ACLK, MCLK, or SMCLK: ADC10SSELx ≠ 0		13 × ADC10DIV × 1/f <sub>ADC10CLK</sub>			
t <sub>ADC10ON</sub>	Turn-on settling time of the ADC	(1)				100	ns

(1) The condition is that the error in a conversion started after t<sub>ADC10ON</sub> is less than ±0.5 LSB. The reference and input signal are already settled.

### 3.1.32 10-Bit ADC, Linearity Parameters

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
E <sub>I</sub>	Integral linearity error		3 V			±1	LSB
E <sub>D</sub>	Differential linearity error		3 V			±1	LSB
E <sub>O</sub>	Offset error	Source impedance R <sub>S</sub> < 100 Ω	3 V			±1	LSB
E <sub>G</sub>	Gain error		3 V		±1.1	±2	LSB
E <sub>T</sub>	Total unadjusted error		3 V		±2	±5	LSB

### 3.1.33 10-Bit ADC, Temperature Sensor and Built-In V<sub>MID</sub>

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
I <sub>SENSOR</sub>	Temperature sensor supply current <sup>(1)</sup>	REFON = 0, INCHx = 0Ah, T <sub>A</sub> = 25°C	3 V		60		μA
TC <sub>SENSOR</sub>		ADC10ON = 1, INCHx = 0Ah <sup>(2)</sup>	3 V		3.55		mV/°C
t <sub>Sensor(sample)</sub>	Sample time required if channel 10 is selected <sup>(3)</sup>	ADC10ON = 1, INCHx = 0Ah, Error of conversion result ≤ 1 LSB	3 V	30			μs
I <sub>VMID</sub>	Current into divider at channel 11	ADC10ON = 1, INCHx = 0Bh	3 V			<sup>(4)</sup>	μA
V <sub>MID</sub>	V <sub>CC</sub> divider at channel 11	ADC10ON = 1, INCHx = 0Bh, V <sub>MID</sub> ≠ 0.5 × V <sub>CC</sub>	3 V		1.5		V
t <sub>VMID(sample)</sub>	Sample time required if channel 11 is selected <sup>(5)</sup>	ADC10ON = 1, INCHx = 0Bh, Error of conversion result ≤ 1 LSB	3 V	1220			ns

(1) The sensor current I<sub>SENSOR</sub> is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I<sub>SENSOR</sub> is included in I<sub>REF+</sub>. When REFON = 0, I<sub>SENSOR</sub> applies during conversion of the temperature sensor input (INCH = 0Ah).

(2) The following formula can be used to calculate the temperature sensor output voltage:

$$V_{\text{Sensor,typ}} = TC_{\text{Sensor}} (273 + T [^{\circ}\text{C}]) + V_{\text{Offset,sensor}} [\text{mV}] \text{ or}$$

$$V_{\text{Sensor,typ}} = TC_{\text{Sensor}} T [^{\circ}\text{C}] + V_{\text{Sensor}}(T_A = 0^{\circ}\text{C}) [\text{mV}]$$

(3) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t<sub>SENSOR(on)</sub>.

(4) No additional current is needed. The V<sub>MID</sub> is used during sampling.

(5) The on-time t<sub>VMID(on)</sub> is included in the sampling time t<sub>VMID(sample)</sub>; no additional on time is needed.

### 3.1.34 Flash Memory

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
V <sub>CC(PGM/ERASE)</sub>	Program and erase supply voltage			2.2		3.6	V
f <sub>FTG</sub>	Flash timing generator frequency			257		476	kHz
I <sub>PGM</sub>	Supply current from V <sub>CC</sub> during program		2.2 V/3.6 V		1	5	mA
I <sub>ERASE</sub>	Supply current from V <sub>CC</sub> during erase		2.2 V/3.6 V		1	7	mA
t <sub>CPT</sub>	Cumulative program time <sup>(1)</sup>		2.2 V/3.6 V			10	ms
t <sub>CMErase</sub>	Cumulative mass erase time		2.2 V/3.6 V	20			ms
	Program/erase endurance			10 <sup>4</sup>	10 <sup>5</sup>		cycles
t <sub>Retention</sub>	Data retention duration	T <sub>J</sub> = 25°C		100			years
t <sub>Word</sub>	Word or byte program time	<sup>(2)</sup>			30		t <sub>FTG</sub>
t <sub>Block, 0</sub>	Block program time for first byte or word	<sup>(2)</sup>			25		t <sub>FTG</sub>
t <sub>Block, 1-63</sub>	Block program time for each additional byte or word	<sup>(2)</sup>			18		t <sub>FTG</sub>
t <sub>Block, End</sub>	Block program end-sequence wait time	<sup>(2)</sup>			6		t <sub>FTG</sub>
t <sub>Mass Erase</sub>	Mass erase time	<sup>(2)</sup>			10593		t <sub>FTG</sub>
t <sub>Seg Erase</sub>	Segment erase time	<sup>(2)</sup>			4819		t <sub>FTG</sub>

- (1) The cumulative program time must not be exceeded when writing to a 64-byte flash block. This parameter applies to all programming methods: individual word/byte write and block write modes.
- (2) These values are hardwired into the Flash Controller's state machine (t<sub>FTG</sub> = 1/f<sub>FTG</sub>).

### 3.1.35 RAM

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
V <sub>(RAMh)</sub>	RAM retention supply voltage <sup>(1)</sup>	CPU halted	1.6		V

- (1) This parameter defines the minimum supply voltage V<sub>CC</sub> when the data in RAM remains unchanged. No program execution should happen during this supply voltage condition.

### 3.1.36 JTAG and Spy-Bi-Wire Interface

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
f <sub>SBW</sub>	Spy-Bi-Wire input frequency		2.2 V	0		20	MHz
t <sub>SBW,Low</sub>	Spy-Bi-Wire low clock pulse length		2.2 V	0.025		15	μs
t <sub>SBW,En</sub>	Spy-Bi-Wire enable time (TEST high to acceptance of first clock edge <sup>(1)</sup> )		2.2 V			1	μs
t <sub>SBW,Ret</sub>	Spy-Bi-Wire return to normal operation time		2.2 V	15		100	μs
f <sub>TCK</sub>	TCK input frequency <sup>(2)</sup>		2.2 V	0		5	MHz
R <sub>Internal</sub>	Internal pulldown resistance on TEST		2.2 V	25	60	90	kΩ

- (1) Tools accessing the Spy-Bi-Wire interface need to wait for the maximum t<sub>SBW,En</sub> time after pulling the TEST/SBWCLK pin high before applying the first SBWCLK clock edge.
- (2) f<sub>TCK</sub> may be restricted to meet the timing requirements of the module selected.

### 3.1.37 JTAG Fuse<sup>(3)</sup>

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
V <sub>CC(FB)</sub>	Supply voltage during fuse-blow condition	T <sub>A</sub> = 25°C	2.5		V
V <sub>FB</sub>	Voltage level on TEST for fuse blow		6	7	V
I <sub>FB</sub>	Supply current into TEST during fuse blow			100	mA

- (3) Once the fuse is blown, no further access to the JTAG/Test, Spy-Bi-Wire, and emulation feature is possible, and JTAG is switched to bypass mode.

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
t <sub>FB</sub>	Time to blow fuse			1	ms

## 3.2 MSP430 Core Operation

### NOTE

For support and specific questions related to the MSP430 in the TPS65835 device, please refer to TI's E2E PMU forum and post relevant questions to the forum at the following link: [TI E2E PMU Forum](#).

Please format your posting as follows:

- **Title:** TPS65835 "specific topic"
- **Body:** Question, with supporting code and oscilloscope screen captures if applicable.

### 3.2.1 Description

The MSP430 integrated into the TPS65835 is from the MSP430x2xx family of ultralow-power microcontrollers. The architecture, combined with five low-power modes is optimized to achieve extended battery life in portable applications. The device features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows wake-up from low-power modes to active mode in less than 1\_μs. The list of the peripherals and modules included in this MSP430 are as follows:

- Up to 16 MHz CPU
- 16 kB Flash Memory
- 512 B RAM
- Basic Clock Module
  - Internal Frequencies up to 16 MHz with one Calibrated Frequency
  - Internal Very-Low-Power Low-Frequency (LF) Oscillator
  - 32 kHz Crystal Support
  - External Digital Clock Source
- 10-Bit ADC
  - 200-ksps Analog-to-Digital (A/D) Converter with Internal Reference, Sample-and-Hold, and Autoscan
- Comparator A+ (Comp\_A+)
  - For Analog Signal Compare Function or Slope Analog-to-Digital (A/D) Conversion
- Timer0\_A3 and Timer1\_A3
  - Up to Two 16-Bit Timer\_A with Three Capture/Compare Registers
- Watchdog WDT+
- USCI A0, Universal Serial Communication Interface
  - Enhanced UART Supporting Auto baudrate Detection (LIN)
  - IrDA Encoder and Decoder
  - Synchronous SPI
  - I<sup>2</sup>C
- USCI B0, Universal Serial Communication Interface
  - Synchronous SPI
  - I<sup>2</sup>C
- JTAG / Spy-By-Wire

### 3.2.2 Accessible MSP430 Pins

There are a number of internal pins connected between the MSP430 core and the power management core as well as external pins on the MSP430. Internal pins are not available externally but can be controlled by the MSP430 core in various ways. A table describing all available MSP430 pin functions (Table 3-1) along with a block diagram detailing the MSP430 core and the pin connectivity (see Figure 3-24) has been made available.

Table 3-1. Internally Connected Pins: MSP430 to Power Management Core

Power Management Core Pin	MSP430 Core Pin	Functionality
VLDO	AVCC / DVCC	Voltage supplied by LDO on power management core, connected to MSP430 power management module Enabled by SWITCH pin input
COMP	P1.0 / A0 / CA0	Scaled down voltage of the BAT pin. Connected to Comparator_A+ channel CA0 or ADC channel A0 of the MSP430 To use "COMP" and Comp_A+ module function of the MSP430, the pin must be configured properly <b>DO NOT CONFIGURE THIS PIN AS A GPIO AND PULL THIS PIN UP OR DOWN, THIS WILL INCREASE THE OPERATING CURRENT OF THE DEVICE</b>
BST_EN	P3.2	Enable pin for the boost on the power management core, <b>ACTIVE HIGH</b>
CHG_EN	P3.1	Enable pin for the charger on the power management core, <b>ACTIVE HIGH</b>
SLEEP	P3.0	Can put entire device into SLEEP state dependent upon system events, e.g., extended loss of IR or RF synchronization <sup>(1)</sup>
HBL1	P2.0	Control pin 1 for left frame of active shutter glasses
HBL2	P2.3	Control pin 2 for left frame of active shutter glasses
HBR1	P2.4	Control pin 1 for right frame of active shutter glasses
HBR2	P2.5	Control pin 2 for right frame of active shutter glasses

(1) Note that the SLEEP signal can not be used to wake the system if it is already in the SLEEP state since the LDO used to power the MSP430 would be disabled in this state.

P3.5/ TA0.1	I/O	General-purpose digital I/O pin Timer0_A, compare: Out0 output

(1) TDO or TDI is selected via JTAG instruction.

(2) If P2.7 is used as an input, excess current will flow until P2SEL.7 is cleared. This is due to the oscillator output driver connection to this pad after reset.

### 3.2.4 Operating Modes

The MSP430 has one active mode and five software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the five low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - DCO's dc-generator is disabled if DCO not used in active mode
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc-generator remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc-generator is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK and SMCLK are disabled
  - DCO's dc-generator is disabled
  - Crystal oscillator is stopped

## 4 APPLICATION INFORMATION

### 4.1 Applications Schematic

Figure 4-1. TPS65835 Applications Schematic

### 4.2 Boost Converter Application Information

#### 4.2.1 Setting Boost Output Voltage

To set the boost converter output voltage of this device, two external resistors that form a feedback network are required. The values recommended below (in Table 4-1) are given for a desired quiescent current of 5 μA when the boost is enabled and switching. See Figure 4-2 for the detail of the applications schematic that shows the boost feedback network and the resistor names used in the table below.

Figure 4-2. Boost Feedback Network Schematic

Table 4-1. Recommended  $R_{FB1}$  and  $R_{FB2}$  Values (for  $I_{Q(FB)} = 5 \mu A$ )

Targeted $V_{BST\_OUT}$	$R_{FB1}^{(1)}$	$R_{FB2}^{(1)}$
8 V	1.3 M $\Omega$	240 k $\Omega$
10 V	1.8 M $\Omega$	240 k $\Omega$
12 V	2.2 M $\Omega$	240 k $\Omega$
14 V	2.4 M $\Omega$	240 k $\Omega$
16 V	3.0 M $\Omega$	240 k $\Omega$

(1) Resistance values given in closest standard value (5% tolerance, E24 grouping).

These resistance values can also be calculated using the following information. To start, it is helpful to target a quiescent current through the boost feedback network while the device is operating ( $I_{Q(FB)}$ ). When the boost output voltage and this targeted quiescent current is known, the total feedback network resistance can be found.

The value for  $R_{FB2}$  can be found by using the boost feedback pin voltage ( $V_{FB} = 1.2$  V, see "Electrical Characteristics" in Section 2) and  $I_{Q(FB)}$  in the following equation:

$$R_{FB1} + R_{FB2} = V_{BST\_OUT} / I_{Q(FB)}$$

$$R_{FB2} = (1.2 \text{ V}) / I_{Q(FB)}$$

To find  $R_{FB1}$ , simply subtract the  $R_{FB2}$  from  $R_{FB(TOT)}$ :

$$R_{FB1} = R_{FB(TOT)} - R_{FB2}$$

#### 4.2.2 Boost Inductor Selection

The selection of the boost inductor and output capacitor is very important to the performance of the boost converter. The boost has been designed for optimized operation when a 10  $\mu H$  inductor is used. Smaller inductors, down to 4.7  $\mu H$ , may be used but there will be a slight loss in overall operating efficiency. A few inductors that have been tested and found to give good performance can be found in the list below:

Recommended 10  $\mu H$  inductors

- TDK VLS201612ET-100M (10  $\mu H$ ,  $I_{MAX} = 0.53$  A,  $R_{DC} = 0.85 \Omega$ )
- Taiyo Yuden CBC2016B100M (10  $\mu H$ ,  $I_{MAX} = 0.41$  A,  $R_{DC} = 0.82 \Omega$ )

### 4.2.3 Boost Capacitor Selection

The recommended minimum value for the capacitor on the boost output, BST\_OUT pin, is 4.7  $\mu$ F. Values that are larger can be used with the measurable impact being a slight reduction in the boost converter output voltage ripple while values smaller than this will result in an increased boost output voltage ripple. Note that the voltage rating of the capacitor should be sized for the maximum expected voltage at the BST\_OUT pin.

### 4.3 Bypassing Default Push-Button SWITCH Functionality

If the SWITCH pin functionality is not required to power on and off the device because of different system requirements (SWITCH timing requirements of system will be controlled by the internal MSP430), then the feature can be bypassed. The following diagram shows the connections required for this configuration.

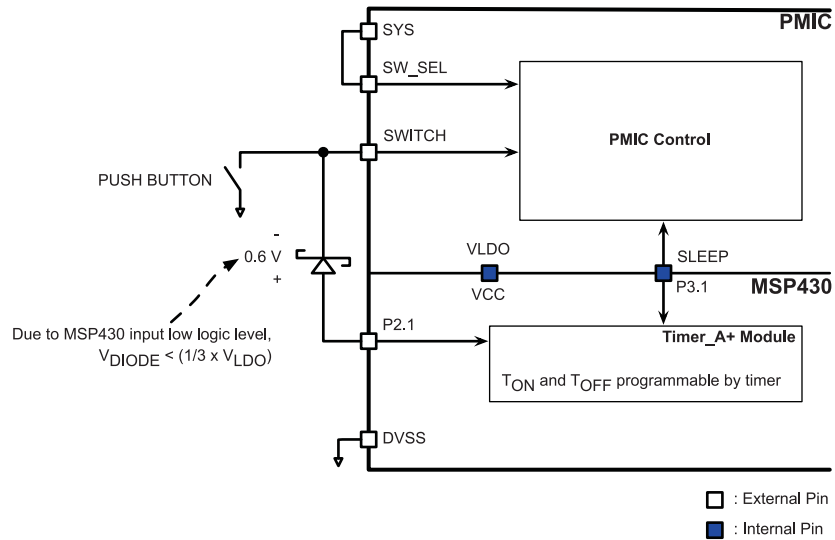

Figure 4-3. Bypassing Default TPS65835 Push Button SWITCH Timing

In a system where a different push-button SWITCH off timing is required, the SLEEP pin is used to control the power off of the device. After system power up, the MCU must force the SLEEP pin to a high state ( $V_{SLEEP} > V_{IH(PMIC)}$ ). Once the SWITCH push-button is pressed to shut the system down, a timer in the MCU should be active and counting the desired  $t_{OFF}$  time of the device. Once this  $t_{OFF}$  time is detected, the MCU can assert the SLEEP signal to a logic low level ( $V_{SLEEP} < V_{IL(PMIC)}$ ). It is on the falling edge of the SLEEP signal where the system will be powered off (see Figure 4-4)

## 4.4 MSP430 Programming

In order to program the integrated MSP430 in the TPS65835 device, ensure that the programming environment supports the TPS65835 device.

### 4.4.1 Code To Setup Power Functions

This section will detail a basic code to control the MSP430 in the TPS65835 and how to configure the power functions and control the power die. Please reference [Table 3-3](#) for the details on configuring the MSP430 pins. Note that `"/` is a comment and this code was written using Code Composer Studio in C.

```
// SETUP H-BRIDGE PINS
P2DIR |= (BIT5 + BIT4 + BIT3 + BIT0); // Set PxDIR to 1 for outputs
P2REN |= (BIT5 + BIT4 + BIT3 + BIT0); // Enable pullup/pulldown resistors on outputs

// SETUP SLEEP, CHG_EN, AND BST_EN
P3DIR |= (BIT2 + BIT1 + BIT0); // Set PxDIR to 1 for outputs
P3REN |= (BIT2 + BIT1 + BIT0); // Enable pullup/pulldown resistors on outputs
```

The previous code setup the power pins for outputs, now they must be controlled with MSP430 code. Refer to the following code to perform initial setup and to control the power functions (SLEEP, CHG\_EN, and BST\_EN):

```
P3OUT &= ~BIT0; // Set SLEEP mode signal low; SLEEP Function is disabled
// P3OUT |= BIT0; // Set SLEEP mode signal high (sleep control via MSP430)

// P3OUT &= ~BIT1; // Set CHG_EN signal low (disable charger)
P3OUT |= BIT1; // Set CHG_EN signal high (enable charger)

// P3OUT &= ~BIT2; // Set BST_EN low (disable boost)
P3OUT |= BIT2; // Set BST_EN high (enable boost)
```

The H-Bridge pins can be controlled in a similar manner (see [Section 2.10.1](#)). The following code is only meant to cover each H-Bridge mode of operation and the appropriate code needed to put it in that state:

```
// BOTH SIDES IN OPEN STATE
P2OUT &= ~(BIT3 + BIT0); // HBL2 = 0, HBL1 = 0
P2OUT &= ~(BIT5 + BIT4); // HBR2 = 0, HBR1 = 0

// BOTH SIDES IN GROUNDED STATE
P2OUT |= BIT3 + BIT0; // HBL2 = 1, HBL1 = 1
P2OUT |= BIT5 + BIT4; // HBR2 = 1, HBR1 = 1

// LEFT SIDE IN CHARGE+ STATE
P2OUT &= ~BIT3; P2OUT |= BIT0; // HBL2 = 0, HBL1 = 1

// LEFT SIDE IN CHARGE- STATE
P2OUT |= BIT3; P2OUT &= ~BIT0; // HBL2 = 1, HBL1 = 0

// RIGHT SIDE IN CHARGE+ STATE
P2OUT &= ~BIT5; P2OUT |= BIT4; // HBR2 = 0, HBR1 = 1

// RIGHT SIDE IN CHARGE- STATE
P2OUT |= BIT5; P2OUT &= ~BIT4; // HBR2 = 1, HBR1 = 0
```

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
