# 3-17V 1A Step-Down Converter in 3x3 QFN Package

Check for Samples: **TPS62150**, **TPS62151**, **TPS62152**, **TPS62153**

## FEATURES

- **DCS-Control™ Topology**
- **Input Voltage Range: 3 to 17V**
- **Up to 1A Output Current**
- **Adjustable Output Voltage from 0.9 to 6V**
- **Pin-Selectable Output Voltage (nominal, + 5%)**
- **Programmable Soft Start and Tracking**
- **Seamless Power Save Mode Transition**
- **Quiescent Current of 17µA (typ.)**
- **Selectable Operating Frequency**
- **Power Good Output**
- **100% Duty Cycle Mode**
- **Short Circuit Protection**
- **Over Temperature Protection**
- **Available in a 3 × 3 mm, QFN-16 Package**

## APPLICATIONS

- **Standard 12V Rail Supplies**
- **POL Supply from Single or Multiple Li-Ion Battery**
- **Solid-State Disk Drives**
- **Embedded Systems**
- **LDO replacement**
- **Mobile PC's, Tablet, Modems, Cameras**

## DESCRIPTION

The TPS6215X family is an easy to use synchronous step down DC-DC converter optimized for applications with high power density. A high switching frequency of typically 2.5MHz allows the use of small inductors and provides fast transient response as well as high output voltage accuracy by utilization of the DCS-Control™ topology.

With its wide operating input voltage range of 3V to 17V, the devices are ideally suited for systems powered from either a Li-Ion or other batteries as well as from 12V intermediate power rails. It supports up to 1A continuous output current at output voltages between 0.9V and 6V (with 100% duty cycle mode).

The output voltage startup ramp is controlled by the soft-start pin, which allows operation as either a standalone power supply or in tracking configurations. Power sequencing is also possible by configuring the Enable and open-drain Power Good pins.

In Power Save Mode, the devices show quiescent current of about 17µA from VIN. Power Save Mode, entered automatically and seamlessly if load is small, maintains high efficiency over the entire load range. In Shutdown Mode, the device is turned off and shutdown current consumption is less than 2µA.

The device, available in adjustable and fixed output voltage versions, is packaged in a 16-pin QFN package measuring 3 × 3 mm (RGT).

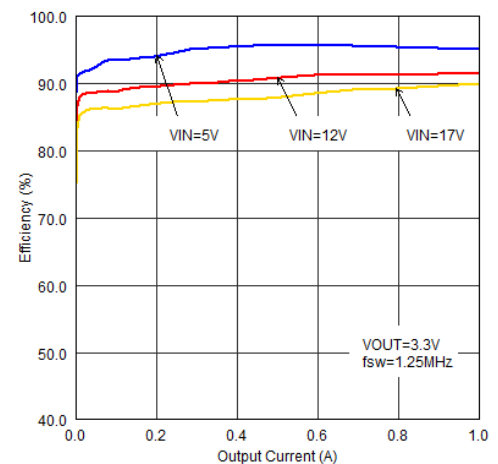

**Figure 1. Typical Application and Efficiency**

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ORDERING INFORMATION[1]

| $T_A$ | OUTPUT VOLTAGE | PART NUMBER[2] | PACKAGE | ORDERING | PACKAGE MARKING |
|---|---|---|---|---|---|
| -40°C to 85°C | adjustable | TPS62150 | 16-Pin QFN | TPS62150RGT | QUA |
| | 1.8 V | TPS62151 | | TPS62151RGT | QWO |
| | 3.3 V | TPS62152 | | TPS62152RGT | QWP |
| | 5.0 V | TPS62153 | | TPS62153RGT | QWQ |

(1) For detailed ordering information please check the PACKAGE OPTION ADDENDUM section at the end of this datasheet.
(2) Contact the factory to check availability of other fixed output voltage versions.

## ABSOLUTE MAXIMUM RATINGS[1]

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|---|---|---|---|---|
| Pin voltage range[2] | AVIN, PVIN | -0.3 | 20 | V |
| | EN, SS/TR | -0.3 | $V_{IN}$+0.3 | |
| | SW | -0.3 | $V_{IN}$+0.3 | V |
| | DEF, FSW, FB, PG, VOS | -0.3 | 7 | V |
| Power Good sink current | PG | | 10 | mA |
| Temperature range | Operating junction temperature range, $T_J$ | -40 | 125 | °C |
| | Storage temperature range, $T_{stg}$ | -65 | 150 | |
| ESD rating[3] | HBM Human body model | | 2 | kV |
| | CDM Charge device model | | 0.5 | kV |

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to network ground terminal.
(3) ESD testing is performed according to the respective JESD22 JEDEC standard.

## THERMAL INFORMATION

| | THERMAL METRIC[1] | TPS6215X RGT 16 PINS | UNITS |
|---|---|---|---|
| $\theta_{JA}$ | Junction-to-ambient thermal resistance | 29.1 | °C/W |
| $\theta_{JC(TOP)}$ | Junction-to-case(top) thermal resistance | 15 | |
| $\theta_{JB}$ | Junction-to-board thermal resistance | 11 | |
| $\psi_{JT}$ | Junction-to-top characterization parameter | 0.5 | |
| $\psi_{JB}$ | Junction-to-board characterization parameter | 10 | |
| $\theta_{JC(BOTTOM)}$ | Junction-to-case(bottom) thermal resistance | 3.5 | |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

| | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|
| Supply Voltage, $V_{IN}$ (at AVIN and P VIN) | 3 | | 17 | V |
| Operating free air temperature, $T_A$ | −40 | | 85 | °C |
| Operating junction temperature, $T_J$ | −40 | | 125 | °C |

## Terminal Functions

| PIN[1] | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| SW | 1,2,3 | O | Switch node, which is connected to the internal MOSFET switches. Connect inductor between SW and output capacitor. |
| PG | 4 | O | Output power good (High = VOUT ready, Low = VOUT below nominal regulation) ; open drain (requires pull-up resistor; goes high impedance, when device is switched off) |
| FB | 5 | I | Voltage feedback of adjustable version connect resistive voltage divider to this pin. Its recommended to connect FB to AGND on fixed output voltage versions for improved thermal performance. |
| AGND | 6 | | Analog Ground. Must be connected directly to the Exposed Thermal Pad and common ground plane. |
| FSW | 7 | I | Switching Frequency Select (Low ≈ 2.5MHz, High ≈ 1.25MHz for typical operation)[2] |
| DEF | 8 | I | Output Voltage Scaling (Low = nominal, High = nominal + 5%)[2] |
| SS/TR | 9 | I | Soft-Start / Tracking Pin. An external capacitor connected to this pin sets the internal voltage reference rise time. It can be used for tracking and sequencing. |
| AVIN | 10 | I | Supply voltage for control circuitry. Connect to same source as PVIN. |
| PVIN | 11,12 | I | Supply voltage for power stage. Connect to same source as AVIN. |
| EN | 13 | I | Enable input (High = enabled, Low = disabled)[2] |
| VOS | 14 | I | Output voltage sense pin and connection for the control loop circuitry. |
| PGND | 15,16 | | Power ground. Must be connected directly to the Exposed Thermal Pad and common ground plane. |
| Exposed Thermal Pad | | | Must be connected to AGND (pin 6), PGND (pin 15,16) and common ground plane[3]. Must be connected to AGND. Must be soldered to achieve appropriate power dissipation and mechanical reliability. |

(1)  For more information about connecting pins, see DETAILED DESCRIPTION and APPLICATION INFORMATION sections.
(2)  An internal pull-down resistor keeps logic level low, if pin is floating.
(3)  See Figure 39.

# DETAILED DESCRIPTION

## Device Operation

The TPS6215X synchronous switched mode power converters are based on DCS-Control™ (**D**irect **C**ontrol with **S**eamless Transition into Power Save Mode), an advanced regulation topology, that combines the advantages of hysteretic, voltage mode and current mode control including an AC loop directly associated to the output voltage. This control loop takes information about output voltage changes and feeds it directly to a fast comparator stage. It sets the switching frequency, which is constant for steady state operating conditions, and provides immediate response to dynamic load changes. To get accurate DC load regulation, a voltage feedback loop is used. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

The DCS-Control™ topology supports PWM (Pulse Width Modulation) mode for medium and heavy load conditions and a Power Save Mode at light loads. During PWM, it operates at its nominal switching frequency in continuous conduction mode. This frequency is typically about 2.5MHz with a controlled frequency variation depending on the input voltage. If the load current decreases, the converter enters Power Save Mode to sustain high efficiency down to very light loads. In Power Save Mode the switching frequency decreases linearly with the load current. Since DCS-Control™ supports both operation modes within one single building block, the transition from PWM to Power Save Mode is seamless without effects on the output voltage.

Fixed output voltage versions provide smallest solution size and lowest current consumption, requiring only 3 external components. An internal current limit supports nominal output currents of up to 1A.

The TPS6215X family offers both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, minimizing interference with RF circuits.

## Pulse Width Modulation (PWM) Operation

The TPS6215X operates with pulse width modulation in continuous conduction mode (CCM) with a nominal switching frequency of 2.5 MHz or 1.25MHz, selectable with the FSW pin. The frequency variation in PWM is controlled and depends on $V_{IN}$, $V_{OUT}$ and the inductance. The device operates in PWM mode as long the output current is higher than half the inductor's ripple current. To maintain high efficiency at light loads, the device enters Power Save Mode at the boundary to discontinuous conduction mode (DCM). This happens if the output current becomes smaller than half the inductor's ripple current.

## Power Save Mode Operation

The TPS6215X's built in Power Save Mode will be entered seamlessly, if the load current decreases. This secures a high efficiency in light load operation. The device remains in Power Save Mode as long as the inductor current is discontinuous.

In Power Save Mode the switching frequency decreases linearly with the load current maintaining high efficiency. The transition into and out of Power Save Mode happens within the entire regulation scheme and is seamless in both directions.

TPS6215X includes a fixed on-time circuitry. This on-time, in steady-state operation, can be estimated as:

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \cdot 400ns$$

(1)

For very small output voltages, an absolute minimum on-time of about 80ns is kept to limit switching losses. The operating frequency is thereby reduced from its nominal value, which keeps efficiency high. Using $t_{ON}$, the typical peak inductor current in Power Save Mode can be approximated by:

$$I_{LPSM(peak)} = \frac{(V_{IN} - V_{OUT})}{L} \cdot t_{ON}$$

(2)

When $V_{IN}$ decreases to typically 15% above $V_{OUT}$, the TPS6215X won't enter Power Save Mode, regardless of the load current. The device maintains output regulation in PWM mode.

## 100% Duty-Cycle Operation

The duty cycle of the buck converter is given by D=Vout/Vin and increases as the input voltage comes close to the output voltage. In this case, the device starts 100% duty cycle operation turning on the high-side switch 100% of the time. The high-side switch stays turned on as long as the output voltage is below the internal setpoint. This allows the conversion of small input to output voltage differences, e.g. for longest operation time of battery-powered applications. In 100% duty cycle mode, the low-side FET is switched off.

The minimum input voltage to maintain output voltage regulation, depending on the load current and the output voltage level, can be calculated as:

$$V_{IN(min)} = V_{OUT(min)} + I_{OUT}\left(R_{DS(on)} + R_L\right)$$

(3)

where

$I_{OUT}$ is the output current,
$R_{DS(on)}$ is the $R_{DS(on)}$ of the high-side FET and
$R_L$ is the DC resistance of the inductor used.

## Enable / Shutdown (EN)

When Enable (EN) is set High, the device starts operation.

Shutdown is forced if EN is pulled Low with a shutdown current of typically 1.5µA. During shutdown, the internal power MOSFETs as well as the entire control circuitry are turned off. The internal resistive divider pulls down the output voltage smoothly. An internal pull-down resistor of about 400kΩ is connected and keeps EN logic low, if the pin is floating. It is disconnected if the pin is High.

Connecting the EN pin to an appropriate output signal of another power rail provides sequencing of multiple power rails.

## Soft Start / Tracking (SS/TR)

The internal soft start circuitry controls the output voltage slope during startup. This avoids excessive inrush current and ensures a controlled output voltage rise time. It also prevents unwanted voltage drops from high-impedance power sources or batteries. When EN is set to start device operation, the device starts switching after a delay of about 50µs and VOUT rises with a slope controlled by an external capacitor connected to the SS/TR pin. See Figure 33 and Figure 34 for typical startup operation.

Connecting SS/TR directly to AVIN provides fastest startup behavior. The TPS6215X can start into a pre-biased output. During monotonic pre-biased startup, both the power MOSFETs are not allowed to turn on until the device's internal ramp sets an output voltage above the pre-bias voltage. If the device is set to shutdown (EN=GND), undervoltage lockout or thermal shutdown, an internal resistor pulls the SS/TR pin down to ensure a proper low level. Returning from those states causes a new startup sequence as set by the SS/TR connection.

A voltage supplied to SS/TR can be used for tracking a master voltage. The output voltage will follow this voltage in both directions up and down (see APPLICATION INFORMATION).

## Current Limit And Short Circuit Protection

The TPS6215X devices are protected against heavy load and short circuit events. At heavy loads, the current limit determines the maximum output current. If the current limit is reached, the high-side FET will be turned off. Avoiding shoot through current, the low-side FET will be switched on to sink the inductor current. The high-side FET will turn on again, only if the current in the low-side FET has decreased below the low side current limit threshold.

The output current of the device is limited by the current limit (see ELECTRICAL CHARACTERISTICS). Due to internal propagation delay, the actual current can exceed the static current limit during that time. The dynamic current limit can be calculated as follows:

$$I_{peak(typ)} = I_{LIMF} + \frac{V_L}{L} \cdot t_{PD}$$

(4)

where

$I_{LIMF}$ is the static current limit, specified in the ELECTRICAL CHARACTERISTICS,

L is the inductor value,

$V_L$ is the voltage across the inductor ($V_{IN}$ - $V_{OUT}$) and

$t_{PD}$ is the internal propagation delay.

The current limit can exceed static values, especially if the input voltage is high and very small inductances are used. The dynamic high side switch the peak current can be calculated as follows:

$$I_{peak(typ)} = I_{LIMF} + \frac{(V_{IN} - V_{OUT})}{L} \cdot 30ns$$

(5)

## Power Good (PG)

The TPS6215X has a built in power good (PG) function to indicate whether the output voltage has reached its appropriate level or not. The PG signal can be used for startup sequencing of multiple rails. The PG pin is an open-drain output that requires a pull-up resistor (to any voltage below 7V). It can sink 2mA of current and maintain it's specified logic low level. It is high impedance when the device is turned off due to EN, UVLO or thermal shutdown.

## Pin-Selectable Output Voltage (DEF)

The output voltage of the TPS6215X devices can be increased by 5% above the nominal voltage by setting the DEF pin to High [1]. When DEF is Low, the device regulates to the nominal output voltage. Increasing the nominal voltage allows adapting the power supply voltage to the variations of the application hardware. More detailed information on voltage margining using TPS6215X can be found in SLVA489. A pull down resistor of about 400kOhm is internally connected to the pin, to ensure a proper logic level if the pin is high impedance or floating. The resistor is disconnected if the pin is High.

## Frequency Selection (FSW)

To get high power density with very small solution size, a high switching frequency allows the use of small external components for the output filter. However switching losses increase with the switching frequency. If efficiency is the key parameter, more than solution size, the switching frequency can be set to half (1.25 MHz typ.) by pulling FSW to High[1]. Pull FSW to Low for high frequency operation (2.5 MHz typ.). Running with lower frequency a higher efficiency, but also a higher output voltage ripple, is achieved. To get low ripple and full output current at the lower switching frequency, it's recommended to use an inductor of 3.3uH. The switching frequency can be changed during operation, if needed. A pull down resistor of about 400kOhm is internally connected to the pin, to ensure a proper logic level if the pin is high impedance or floating. The resistor is disconnected if the pin is High.

## Under Voltage Lockout (UVLO)

If the input voltage drops, the under voltage lockout prevents misoperation of the device by switching off both the power FETs. The under voltage lockout threshold is set typically to 2.7V. The device is fully operational for voltages above the UVLO threshold and turns off if the input voltage trips the threshold. The converter starts operation again once the input voltage exceeds the threshold by a hysteresis of typically 200mV.

## Thermal Shutdown

The junction temperature ($T_j$) of the device is monitored by an internal temperature sensor. If $T_j$ exceeds 160°C (typ), the device goes into thermal shut down. Both the high-side and low-side power FETs are turned off and PG goes high impedance. When $T_j$ decreases below the hysteresis amount, the converter resumes normal operation, beginning with Soft Start. To avoid unstable conditions, a hysteresis of typically 20°C is implemented on the thermal shut down temperature.

[1] Maximum allowed voltage is 7V. Therefore, it's recommended to connect it to VOUT, not VIN.

## APPLICATION INFORMATION

The following information is intended to be a guideline through the individual power supply design process.

### Programming The Output Voltage

While the output voltage of the TPS62150 is adjustable, the TPS62151/2/3 are programmed to fixed output voltages. For fixed output versions, the FB pin is pulled down internally and may be left floating. It is recommended to connect to AGND to improve thermal resistance. The adjustable version can be programmed for output voltages from 0.9V to 6V by using a resistive divider from VOUT to AGND. The voltage at the FB pin is regulated to 800mV. The value of the output voltage is set by the selection of the resistive divider from Equation 6 (see Figure 4). It is recommended to choose resistor values which allow a current of at least 2uA, meaning the value of R2 shouldn't exceed 400kΩ. Lower resistor values are recommended for highest accuracy and most robust design. For applications requiring lowest current consumption, the use of fixed output voltage versions is recommended.

$$R_1 = R_2 \ \left( \frac{V_{OUT}}{V_{REF}} - 1 \right)$$

(6)

In case the FB pin gets opened, the device clamps the output voltage at the VOS pin internally to about 7.4V.

### External Component Selection

The external components have to fulfill the needs of the application, but also the stability criteria of the devices control loop. The TPS6215X is optimized to work within a range of external components. The LC output filters inductance and capacitance have to be considered in conjunction, creating a double pole, responsible for the corner frequency of the converter (see Output Filter And Loop Stability section). Table 1 can be used to simplify the output filter component selection.

**Table 1. L-C Output Filter Combinations[1]**

|        | 4.7µF | 10µF | 22µF     | 47µF | 100µF | 200µF | 400µF |
|--------|-------|------|----------|------|-------|-------|-------|
| 0.47µH |       |      |          |      |       |       |       |
| 1µH    |       |      | √        | √    | √     | √     |       |
| 2.2µH  |       | √    | √[2]     | √    | √     | √     |       |
| 3.3µH  |       | √    | √        | √    | √     |       |       |
| 4.7µH  |       |      |          |      |       |       |       |

(1)    The values in the table are nominal values.
(2)    This LC combination is the standard value and recommended for most applications.

The TPS6215X can be run with an inductor as low as 1µH or 2.2µH. FSW should be set Low in this case. However, for applications running with the low frequency setting (FSW=High) or with low input voltages, 3.3µH is recommended. More detailed information on further LC combinations can be found in SLVA463.

### Inductor Selection

The inductor selection is affected by several effects like inductor ripple current, output ripple voltage, PWM-to-PSM transition point and efficiency. In addition, the inductor selected has to be rated for appropriate saturation current and DC resistance (DCR). Equation 7 and Equation 8 calculate the maximum inductor current under static load conditions.

$$I_{L(\max)} = I_{OUT(\max)} + \frac{\Delta I_{L(\max)}}{2}$$

(7)

$$\Delta I_{L(\max)} = V_{OUT} \cdot \left( \frac{1 - \dfrac{V_{OUT}}{V_{IN(\max)}}}{L_{(\min)} \cdot f_{SW}} \right)$$

(8)

where

$I_L(max)$ is the maximum inductor current,

$\Delta I_L$ is the Peak to Peak Inductor Ripple Current,

$L(min)$ is the minimum effective inductor value and

$f_{SW}$ is the actual PWM Switching Frequency.

Calculating the maximum inductor current using the actual operating conditions gives the minimum saturation current of the inductor needed. A margin of about 20% is recommended to add. A larger inductor value is also useful to get lower ripple current, but increases the transient response time and size as well. The following inductors have been used with the TPS6215X and are recommended for use:

**Table 2. List of Inductors**

| Type | Inductance [µH] | Saturation Current [A][1] | Dimensions [L x B x H] mm | MANUFACTURER |
|---|---|---|---|---|
| XFL4020-222ME_ | 2.2 µH, ±20% | 3.5 | 4 x 4 x 2.1 | Coilcraft |
| XFL3012-222MEC | 2.2 µH, ±20% | 1.6 | 3 x 3 x 1.2 | Coilcraft |
| XFL3012-332MEC | 3.3 µH, ±20% | 1.4 | 3 x 3 x 1.2 | Coilcraft |
| VLS252012T-2R2M1R3 | 2.2 µH, ±20% | 1.3 | 2.5 x 2 x 1.2 | TDK |
| LPS3015-332 | 3.3 µH, ±20% | 1.4 | 3 x 3 x 1.4 | Coilcraft |
| 744025003 | 3.3 µH, ±20% | 1.5 | 2.8 x 2.8 x 2.8 | Wuerth |
| PSI25201B-2R2MS | 2.2 µH, ±20% | 1.3 | 2 x 2.5 x 1.2 | Cyntec |
| NR3015T-2R2M | 2.2 µH, ±20% | 1.5 | 3 x 3 x 1.5 | Taiyo Yuden |

(1) Lower of $I_{RMS}$ at 40°C rise or $I_{SAT}$ at 30% drop.

The inductor value also determines the load current at which Power Save Mode is entered:

$$I_{load(PSM)} = \frac{1}{2} \Delta I_L$$

(9)

Using Equation 8, this current level can be adjusted by changing the inductor value.

**Capacitor Selection**

*Output Capacitor*

The recommended value for the output capacitor is 22uF. The architecture of the TPS6215X allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, it's recommended to use X7R or X5R dielectric. Using a higher value can have some advantages like smaller voltage ripple and a tighter DC output accuracy in Power Save Mode (see SLVA463).

Note: In power save mode, the output voltage ripple depends on the output capacitance, Its ESR and the peak inductor current. Using ceramic capacitors provides small ESR and low ripple.

Product Folder Links: *TPS62150 TPS62151  TPS62152  TPS62153*

### Input Capacitor

For most applications, 10µF will be sufficient and is recommended, though a larger value reduces input current ripple further. The input capacitor buffers the input voltage for transient events and also decouples the converter from the supply. A low ESR multilayer ceramic capacitor is recommended for best filtering and should be placed between PVIN and PGND as close as possible to those pins. Even though AVIN and PVIN must be supplied from the same input source, it's recommended to place a capacitance of 0.1uF from AVIN to AGND, to avoid potential noise coupling. An RC, low-pass filter from PVIN to AVIN may be used but is not required.

### Soft Start Capacitor

A capacitance connected between SS/TR pin and AGND allows a user programmable start-up slope of the output voltage. A constant current source supports 2.5µA to charge the external capacitance. The capacitor required for a given soft-start ramp time for the output voltage is given by:

$$C_{SS} = t_{SS} \cdot \frac{2.5\mu A}{1.25V} \quad [F]$$

(10)

where

 $C_{SS}$ is the capacitance (F) required at the SS/TR pin and

 $t_{SS}$ is the desired soft-start ramp time (s).

> **NOTE**
> **DC Bias effect:** High capacitance ceramic capacitors have a DC Bias effect, which will have a strong influence on the final effective capacitance. Therefore the right capacitor value has to be chosen carefully. Package size and voltage rating in combination with dielectric material are responsible for differences between the rated capacitor value and the effective capacitance.

### Tracking Function

If a tracking function is desired, the SS/TR pin can be used for this purpose by connecting it to an external tracking voltage. The output voltage tracks that voltage. If the tracking voltage is between 50mV and 1.2V, the FB pin will track the SS/TR pin voltage as described in Equation 11 and shown in Figure 37.
$$V_{FB} \approx 0.64 \cdot V_{SS/TR}$$

(11)

**Figure 37.  Voltage Tracking Relationship**

Product Folder Links: *TPS62150 TPS62151  TPS62152  TPS62153*

This works for rising and falling tracking voltages with the same behavior, as long as the input voltage is inside the recommended operating conditions. When driving the SS/TR pin with an external voltage, do not exceed the voltage rating of the SS/TR pin which is $V_{IN}$+0.3V.

If the input voltage drops into undervoltage lockout or even down to zero, the output voltage will go to zero, independent of the tracking voltage. Figure 38 shows how to connect devices to get ratiometric and simultaneous sequencing by using the tracking function.

**Figure 38. Sequence for Ratiometric and Simultaneous Startup**

The resistive divider of R1 and R2 can be used to change the ramp rate of VOUT2 faster, slower or the same as VOUT1.

A sequential startup is achieved by connecting the PG pin of VOUT1 to the EN pin of VOUT2. Ratiometric start up sequence happens if both supplies are sharing the same soft start capacitor. Equation 10 calculates the soft start time, though the SS/TR current has to be doubled. Details about these and other tracking and sequencing circuits are found in SLVA470.

Note: If the voltage at the FB pin is below its typical value of 0.8V, the output voltage accuracy may have a wider tolerance than specified.

## Output Filter And Loop Stability

The devices of the TPS6215X family are internally compensated to be stable with L-C filter combinations corresponding to a corner frequency to be calculated with Equation 12:

$$f_{LC} = \frac{1}{2\pi \sqrt{L \cdot C}}$$

(12)

Proven nominal values for inductance and ceramic capacitance are given in Table 1 and are recommended for use. Different values may work, but care has to be taken on the loop stability which will be affected. More information including a detailed L-C stability matrix can be found in SLVA463.

The TPS6215X devices, both fixed and adjustable versions, include an internal 25pF feedforward capacitor, connected between the VOS and FB pins. This capacitor impacts the frequency behavior and sets a pole and zero in the control loop with the resistors of the feedback divider, per equation Equation 13 and Equation 14:

$$f_{zero} = \frac{1}{2\pi \cdot R_1 \cdot 25\,pF}$$

(13)

$$f_{pole} = \frac{1}{2\pi \cdot 25\,pF} \cdot \left( \frac{1}{R_1} + \frac{1}{R_2} \right)$$

(14)

Though the TPS6215x devices are stable without the pole and zero being in a particular location, adjusting their location to the specific needs of the application can provide better performance in Power Save mode and/or improved transient response. An external feedforward capacitor can also be added. A more detailed discussion on the optimization for stability vs. transient response can be found in SLVA289 and SLVA466.

## Layout Considerations

A proper layout is critical for the operation of a switched mode power supply, even more at high switching frequencies. Therefore the PCB layout of the TPS6215X demands careful attention to ensure operation and to get the performance specified. A poor layout can lead to issues like poor regulation (both line and load), stability and accuracy weaknesses, increased EMI radiation and noise sensitivity.

See Figure 39 for the recommended layout of the TPS6215X, which is designed for common external ground connections. Therefore both AGND and PGND pins are directly connected to the Exposed Thermal Pad. On the PCB, the direct common ground connection of AGND and PGND to the Exposed Thermal Pad and the system ground (ground plane) is mandatory. Also connect the VOS pin in the shortest way to VOUT at the output capacitor.

Provide low inductive and resistive paths for loops with high di/dt. Therefore paths conducting the switched load current should be as short and wide as possible. Provide low capacitive paths (with respect to all other nodes) for wires with high dv/dt. Therefore the input and output capacitance should be placed as close as possible to the IC pins and parallel wiring over long distances as well as narrow traces should be avoided. Loops which conduct an alternating current should outline an area as small as possible, as this area is proportional to the energy radiated.

Sensitive nodes like FB and VOS need to be connected with short wires and not nearby high dv/dt signals (e.g. SW). As they carry information about the output voltage, they should be connected as close as possible to the actual output voltage (at the output capacitor). The capacitor on the SS/TR pin and on AVIN as well as the FB resistors, R1 and R2, should be kept close to the IC and connect directly to those pins and the system ground plane.

The Exposed Thermal Pad must be soldered to the circuit board for mechanical reliability and to achieve appropriate power dissipation.

The recommended layout is implemented on the EVM and shown in its Users Guide, SLVU437. Additionally, the EVM Gerber data are available for download here, SLVC394.

## THERMAL INFORMATION

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are listed below:
• Improving the power dissipation capability of the PCB design
• Improving the thermal coupling of the component to the PCB by soldering the Exposed Thermal Pad
• Introducing airflow in the system

For more details on how to use the thermal parameters, see the application notes: Thermal Characteristics Application Note (SZZA017), and (SPRA953).

The TPS6215X is designed for a maximum operating junction temperature ($T_j$) of 125°C. Therefore the maximum output power is limited by the power losses that can be dissipated over the actual thermal resistance, given by the package and the surrounding PCB structures. If the thermal resistance of the package is given, the size of the surrounding copper area and a proper thermal connection of the IC can reduce the thermal resistance. To get an improved thermal behavior, it's recommended to use top layer metal to connect the device with wide and thick metal lines. Internal ground layers can connect to vias directly under the IC for improved thermal performance.

If short circuit or overload conditions are present, the device is protected by limiting internal power dissipation.

## Application Example As Power LED Supply

The TPS62150 can be used as a power supply for power LEDs. The FB pin can be easily set down to lower values than nominal by using the SS/TR pin. With that, the voltage drop on the sense resistor is low to avoid excessive power loss. Since this pin provides 2.5µA, the FB pin voltage can be adjusted by an external resistor per Equation 15. This drop, proportional to the LED current, is used to regulate the output voltage (anode voltage) to a proper level to drive the LED. Both analog and PWM dimming are supported with the TPS62150. Figure 40 shows an application circuit, tested with analog dimming:

**Figure 40.  Single Power LED Supply**

The resistor at SS/TR sets the FB voltage to a level of about 300mV and is calculated from Equation 15.

$$V_{FB} = 0.64 \cdot 2.5\mu A \cdot R_{SS/TR}$$

(15)

The device now supplies a constant current, set by the resistor at the FB pin, by regulating the output voltage accordingly. The minimum input voltage has to be rated according the forward voltage needed by the LED used. More information is available in the Application Note SLVA451.
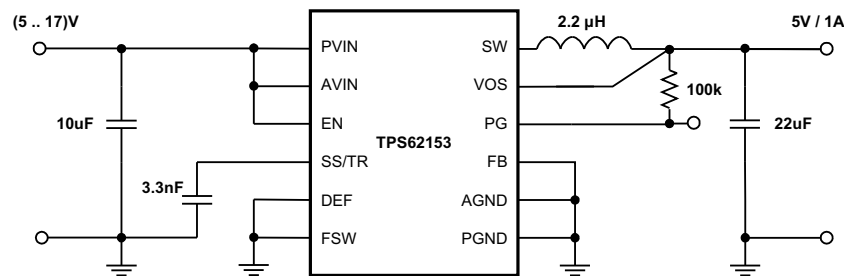

## Typical Applications

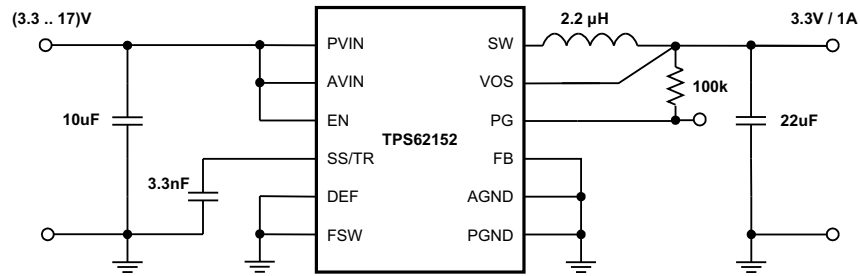

**Figure 41.  5V/1A Power Supply**
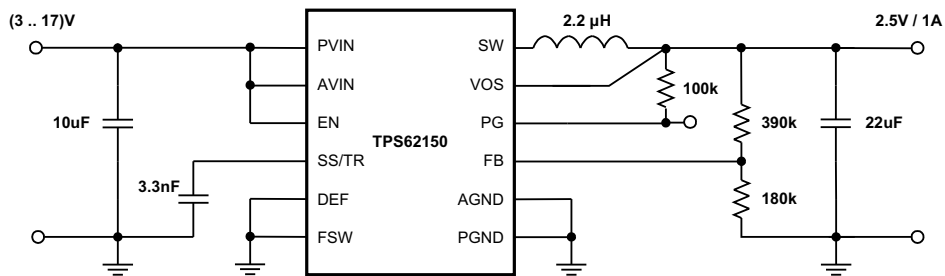

**Figure 42. 3.3V/1A Power Supply**
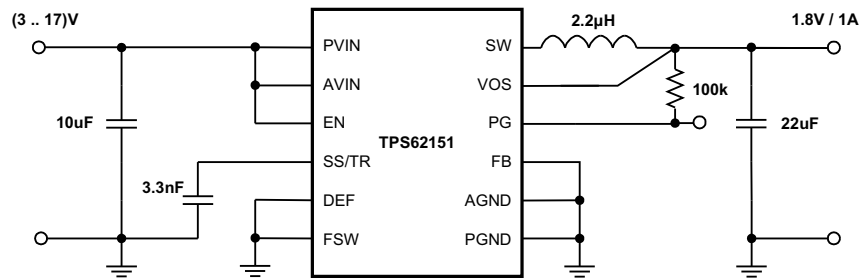

**Figure 43. 2.5V/1A Power Supply**

**Figure 44. 1.8V/1A Power Supply**

Product Folder Links: *TPS62150 TPS62151  TPS62152  TPS62153*

**Figure 45.  1.5V/1A Power Supply**

**Figure 46.  1.2V/1A Power Supply**

**Figure 47.  1V/1A Power Supply**

**Figure 48. -3.3V Inverting Power Supply**

The TPS62150 can be used as inverting power supply by rearranging external circuitry as shown in Figure 48. As the former GND node now represents a voltage level below system ground, the voltage difference between $V_{IN}$ and $V_{OUT}$ has to be limited for operation to the maximum supply voltage of 17V.

In inverting operation mode, the output current capability is reduced by the input to output voltage conversion ratio:

$$I_{OUT} = \frac{V_{IN}}{V_{OUT}} \cdot I_{IN} \cdot \eta$$

(16)

The transfer function of the inverting power supply configuration differs from the buck mode transfer function, incorporating a Right Half Plane Zero additionally. The loop stability has to be adapted and an output capacitance of at least 22µF is recommended. A detailed design example is given in SLVA469A.

**(1)** The marketing status values are defined as follows:
**ACTIVE:** Product device recommended for new designs.
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE:** TI has discontinued the production of the device.

**(2)** Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
**TBD:** The Pb-Free/Green conversion plan has not been defined.
**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

**(3)** MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**(4)** Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

RGT (S−PVQFN−N16)                    PLASTIC QUAD FLATPACK NO−LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No−Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

# IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
