

## DAC081S101 8-Bit Micro Power Digital-to-Analog Converter with Rail-to-Rail Output

Check for Samples: [DAC081S101](#)

### FEATURES

- **Guaranteed Monotonicity**
- **Low Power Operation**
- **Rail-to-Rail Voltage Output**
- **Power-on Reset to Zero Volts Output**
- **SYNC Interrupt Facility**
- **Wide Power Supply Range (+2.7V to +5.5V)**
- **Small Packages**
- **Power Down Feature**

### APPLICATIONS

- **Battery-Powered Instruments**
- **Digital Gain and Offset Adjustment**
- **Programmable Voltage & Current Sources**
- **Programmable Attenuators**

### DESCRIPTION

The DAC081S101 is a full-featured, general purpose 8-bit voltage-output digital-to-analog converter (DAC) that can operate from a single +2.7V to 5.5V supply and consumes just 175  $\mu$ A of current at 3.6 Volts. The on-chip output amplifier allows rail-to-rail output swing and the three wire serial interface operates at clock rates up to 30 MHz over the specified supply voltage range and is compatible with standard SPI™, QSPI, MICROWIRE and DSP interfaces. Competitive devices are limited to 20 MHz clock rates at supply voltages in the 2.7V to 3.6V range.

The supply voltage for the DAC081S101 serves as its voltage reference, providing the widest possible output dynamic range. A power-on reset circuit ensures that the DAC output powers up to zero volts and remains there until there is a valid write to the device. A power-down feature reduces power consumption to less than a microWatt.

The low power consumption and small packages of the DAC081S101 make it an excellent choice for use in battery operated equipment.

The DAC081S101 is a direct replacement for the AD5300 and is one of a family of pin compatible DACs, including the 10-bit DAC101S101 and the 12-bit DAC121S101. The DAC081S101 operates over the extended industrial temperature range of  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ .

**Table 1. Key Specifications**

		VALUE
Resolution		8 bits
DNL		+0.04, -0.02 LSB (typ)
Output Settling Time		3 $\mu$ s (typ)
Zero Code Error		3.8mV (typ)
Full-Scale Error		-0.07 %FS (typ)
Power Consumption	Normal Mode	0.63 mW (3.6V) / 1.41 mW (5.5V) typ
	Pwr Down Mode	0.14 $\mu$ W (3.6V) / 0.33 $\mu$ W (5.5V) typ

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**Pin Configuration**

**Block Diagram**

**Pin Descriptions**

Name	SOT-23 Pin No.	VSSOP Pin No.	Description
V <sub>OUT</sub>	1	4	DAC Analog Output Voltage.
GND	2	8	Ground reference for all on-chip circuitry.
V <sub>A</sub>	3	1	Power supply and Reference input. Should be decoupled to GND.
D <sub>IN</sub>	4	7	Serial Data Input. Data is clocked into the 16-bit shift register on the falling edges of SCLK after the fall of SYNC.
SCLK	5	6	Serial Clock Input. Data is clocked into the input shift register on the falling edges of this pin.
SYNC	6	5	Frame synchronization input for the data input. When this pin goes low, it enables the input shift register and data is transferred on the falling edges of SCLK. The DAC is updated on the 16th clock cycle unless SYNC is brought high before the 16th clock, in which case the rising edge of SYNC acts as an interrupt and the write sequence is ignored by the DAC.
NC		2, 3	No Connect. There is no internal connection to these pins.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings <sup>(1)(2)</sup>

Supply Voltage, $V_A$	6.5V
Voltage on any Input Pin	-0.3V to ( $V_A + 0.3V$ )
Input Current at Any Pin <sup>(3)</sup>	10 mA
Package Input Current <sup>(3)</sup>	20 mA
Power Consumption at $T_A = 25^\circ\text{C}$	See <sup>(4)</sup>
ESD Susceptibility <sup>(5)</sup>	
Human Body Model	2500V
Machine Model	250V
Soldering Temperature, Infrared, 10 Seconds <sup>(6)</sup>	235°C
Storage Temperature	-65°C to +150°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the [Electrical Characteristics](#). The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) All voltages are measured with respect to GND = 0V, unless otherwise specified
- (3) When the input voltage at any pin exceeds the power supplies (that is, less than GND, or greater than  $V_A$ ), the current at that pin should be limited to 10 mA. The 20 mA maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of 10 mA to two.
- (4) The absolute maximum junction temperature ( $T_{Jmax}$ ) for this device is 150°C. The maximum allowable power dissipation is dictated by  $T_{Jmax}$ , the junction-to-ambient thermal resistance ( $\theta_{JA}$ ), and the ambient temperature ( $T_A$ ), and can be calculated using the formula  $P_{DMAX} = (T_{Jmax} - T_A) / \theta_{JA}$ . The values for maximum power dissipation will be reached only when the device is operated in a severe fault condition (e.g., when input or output pins are driven beyond the power supply voltages, or the power supply polarity is reversed). Obviously, such conditions should always be avoided.
- (5) Human body model is 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor. Machine model is 220 pF discharged through ZERO Ohms.
- (6) See the section entitled "Surface Mount" found in any post 1986 National Semiconductor Linear Data Book for methods of soldering surface mount devices.

## Operating Ratings <sup>(1)(2)</sup>

Operating Temperature Range	$-40^\circ\text{C} \leq T_A \leq +105^\circ\text{C}$
Supply Voltage, $V_A$ <sup>(3)</sup>	+2.7V to 5.5V
Any Input Voltage <sup>(4)</sup>	-0.1 V to ( $V_A + 0.1$ V)
Output Load	0 to 1500 pF
SCLK Frequency	Up to 30 MHz

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the [Electrical Characteristics](#). The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- (2) All voltages are measured with respect to GND = 0V, unless otherwise specified
- (3) To guarantee accuracy, it is required that  $V_A$  be well bypassed.
- (4) The analog inputs are protected as shown below. Input voltage magnitudes up to  $V_A + 300$  mV or to 300 mV below GND will not damage this device. However, errors in the conversion result can occur if any input goes above  $V_A$  or below GND by more than 100 mV. For example, if  $V_A$  is  $2.7V_{DC}$ , ensure that  $-100\text{mV} \leq \text{input voltages} \leq 2.8V_{DC}$  to ensure accurate conversions.

## Package Thermal Resistances

Package	$\theta_{JA}$
8-Lead VSSOP	240°C/W
6-Lead SOT	250°C/W

## Electrical Characteristics

Values shown in this table are design targets and are subject to change before product release.

The following specifications apply for  $V_A = +2.7V$  to  $+5.5V$ ,  $R_L = 2k\Omega$  to GND,  $C_L = 200$  pF to GND,  $f_{SCLK} = 30$  MHz, input code range 4 to 251. **Boldface limits apply for  $T_{MIN} \leq T_A \leq T_{MAX}$** : all other limits  $T_A = 25^\circ C$ , unless otherwise specified.

Parameter	Test Conditions	Typical <sup>(1)</sup>	Limits <sup>(1)</sup>	Units (Limits)

## AC and Timing Characteristics

Values shown in this table are design targets and are subject to change before product release.

The following specifications apply for  $V_A = +2.7V$  to  $+5.5V$ ,  $R_L = 2k\Omega$  to GND,  $C_L = 200$  pF to GND,  $f_{SCLK} = 30$  MHz, input code range 4 to 251. **Boldface limits apply for  $T_{MIN} \leq T_A \leq T_{MAX}$** : all other limits  $T_A = 25^\circ C$ , unless otherwise specified.

Parameter		Test Conditions		Typical	Limits	Units (Limits)
$f_{SCLK}$	SCLK Frequency				<b>30</b>	MHz (max)
$t_s$	Output Voltage Settling Time (1)	40h to C0h code change, $R_L = 2k\Omega$	$C_L \leq 200$ pF	3	<b>5</b>	$\mu s$ (max)
SR	Output Slew Rate			1		V/ $\mu s$
	Glitch Impulse	Code change from 80h to 7Fh		12		nV-sec
	Digital Feedthrough			0.5		nV-sec
$t_{WU}$	Wake-Up Time	$V_A = 5V$		6		$\mu s$
		$V_A = 3V$		39		$\mu s$
$1/f_{SCLK}$	SCLK Cycle Time				<b>33</b>	ns (min)
$t_H$	SCLK High time			5	<b>13</b>	ns (min)
$t_L$	SCLK Low Time			5	<b>13</b>	ns (min)
$t_{SACL}$	Set-up Time $\overline{SYNC}$ to SCLK Rising Edge			-15	<b>0</b>	ns (min)
$t_{SUD}$	Data Set-Up Time			2.5	<b>5</b>	ns (min)
$t_{DHD}$	Data Hold Time			2.5	<b>4.5</b>	ns (min)
$t_{CS}$	SCLK fall to rise of $\overline{SYNC}$	$V_A = 5V$		0	<b>3</b>	ns (min)
		$V_A = 3V$		-2	<b>1</b>	ns (min)
$t_{SYNC}$	$\overline{SYNC}$ High Time	$2.7 \leq V_A \leq 3.6$		9	<b>20</b>	ns (min)
		$3.6 \leq V_A \leq 5.5$		5	<b>10</b>	ns (min)

(1) This parameter is guaranteed by design and/or characterization and is not tested in production.

## Specification Definitions

**DIFFERENTIAL NON-LINEARITY (DNL)** is the measure of the maximum deviation from the ideal step size of 1 LSB, which is  $V_{REF} / 256 = V_A / 256$ .

**DIGITAL FEEDTHROUGH** is a measure of the energy injected into the analog output of the DAC from the digital inputs when the DAC outputs are not updated. It is measured with a full-scale code change on the data bus.

**FULL-SCALE ERROR** is the difference between the actual output voltage with a full scale code (FFh) loaded into the DAC and the value of  $V_A \times 255 / 256$ .

**GAIN ERROR** is the deviation from the ideal slope of the transfer function. It can be calculated from Zero and Full-Scale Errors as  $GE = FSE - ZE$ , where GE is Gain error, FSE is Full-Scale Error and ZE is Zero Error.

**GLITCH IMPULSE** is the energy injected into the analog output when the input code to the DAC register changes. It is specified as the area of the glitch in nanovolt-seconds.

**INTEGRAL NON-LINEARITY (INL)** is a measure of the deviation of each individual code from a straight line through the input to output transfer function. The deviation of any given code from this straight line is measured from the center of that code value. The end point method is used. INL for this product is specified over a limited range, per the Electrical Tables.

**LEAST SIGNIFICANT BIT (LSB)** is the bit that has the smallest value or weight of all bits in a word. This value is

$$LSB = V_{REF} / 2^n \quad (1)$$

where  $V_{REF}$  is the supply voltage for this product, and "n" is the DAC resolution in bits, which is 8 for the DAC081S101.

**MAXIMUM LOAD CAPACITANCE** is the maximum capacitance that can be driven by the DAC with output stability maintained.

**MONOTONICITY** is the condition of being monotonic, where the DAC has an output that never decreases when the output code increases.

**MOST SIGNIFICANT BIT (MSB)** is the bit that has the largest value or weight of all bits in a word. Its value is  $1/2$  of  $V_A$ .

**POWER EFFICIENCY** is the ratio of the output current to the total supply current. The output current comes from the power supply. The difference between the supply and output currents, is the power consumed by the device without a load.

**SETTLING TIME** is the time for the output to settle within  $1/2$  LSB of the final value after the input code is updated.

**WAKE-UP TIME** is the time for the output to settle to within  $1/2$  LSB of the final value after the device is commanded to the active mode from any of the power down modes.

**ZERO CODE ERROR** is the output error, or voltage, present at the DAC output after a code of 00h has been entered.

## FUNCTIONAL DESCRIPTION

### DAC SECTION

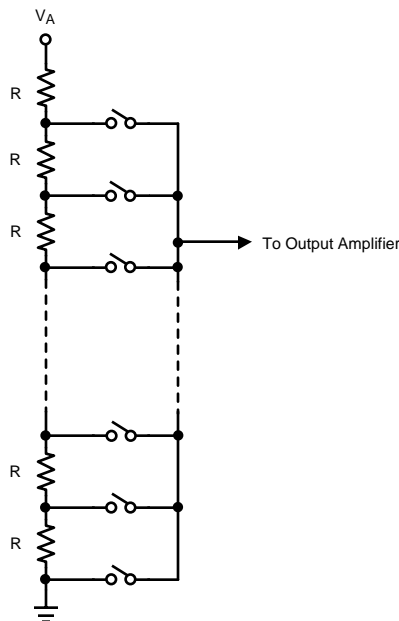

The DAC081S101 is fabricated on a CMOS process with an architecture that consists of switches and a resistor string that are followed by an output buffer. The power supply serves as the reference voltage. The input coding is straight binary with an ideal output voltage of:

$$V_{OUT} = V_A \times (D / 256) \quad (2)$$

where  $D$  is the decimal equivalent of the binary code that is loaded into the DAC register and can take on any value between 0 and 255.

### RESISTOR STRING

The resistor string is shown in [Figure 35](#). This string consists of 4096 equal valued resistors with a switch at each junction of two resistors, plus a switch to ground. The code loaded into the DAC register determines which switch is closed, connecting the proper node to the amplifier. This configuration guarantees that the DAC is monotonic.

**Figure 35. DAC Resistor String**

### OUTPUT AMPLIFIER

The output buffer amplifier is a rail-to-rail type, providing an output voltage range of 0V to  $V_A$ . All amplifiers, even rail-to-rail types, exhibit a loss of linearity as the output approaches the supply rails (0V and  $V_A$ , in this case). For this reason, linearity is specified over less than the full output range of the DAC. The output capabilities of the amplifier are described in the Electrical Tables.

### SERIAL INTERFACE

The three-wire interface is compatible with SPI, QSPI and MICROWIRE as well as most DSPs. See the Timing Diagram for information on a write sequence.

A write sequence begins by bringing the  $\overline{\text{SYNC}}$  line low. Once  $\overline{\text{SYNC}}$  is low, the data on the  $D_{IN}$  line is clocked into the 16-bit serial input register on the falling edges of SCLK. On the 16th falling clock edge, the last data bit is clocked in and the programmed function (a change in the mode of operation and/or a change in the DAC register contents) is executed. At this point the  $\overline{\text{SYNC}}$  line may be kept low or brought high. In either case, it must be brought high for the minimum specified time before the next write sequence as a falling edge of  $\overline{\text{SYNC}}$  is used to initiate the next write cycle.

Since the  $\overline{\text{SYNC}}$  and  $D_{\text{IN}}$  buffers draw more current when they are high, they should be idled low between write sequences to minimize power consumption.

### INPUT SHIFT REGISTER

The input shift register, [Figure 36](#), has sixteen bits. The first two bits are "don't cares" and are followed by two bits that determine the mode of operation (normal mode or one of three power-down modes). The contents of the serial input register are transferred to the DAC register on the sixteenth falling edge of SCLK. See Timing Diagram, [Figure 2](#).

**Figure 36. Input Register Contents**

Normally, the  $\overline{\text{SYNC}}$  line is kept low for at least 16 falling edges of SCLK and the DAC is updated on the 16th SCLK falling edge. However, if  $\overline{\text{SYNC}}$  is brought high before the 16th falling edge, the shift register is reset and the write sequence is invalid. The DAC register is not updated and there is no change in the mode of operation or in the output voltage.

### POWER-ON RESET

The power-on reset circuit controls the output voltage during power-up. Upon application of power the DAC register is filled with zeros and the output voltage is 0 Volts and remains there until a valid write sequence is made to the DAC.

### POWER-DOWN MODES

The DAC081S101 has four modes of operation. These modes are set with two bits (DB13 and DB12) in the control register.

**Table 2. Modes of Operation**

DB13	DB12	Operating Mode
0	0	Normal Operation
0	1	Power-Down with 1kΩ to GND
1	0	Power-Down with 100kΩ to GND
1	1	Power-Down with Hi-Z

When both DB13 and DB12 are 0, the device operates normally. For the other three possible combinations of these bits the supply current drops to its power-down level and the output is pulled down with either a 1kΩ or a 100kΩ resistor, or is in a high impedance state, as described in [Table 2](#).

The bias generator, output amplifier, the resistor string and other linear circuitry are all shut down in any of the power-down modes. However, the contents of the DAC register are unaffected when in power-down, so when coming out of power down the output voltage returns to the same voltage it was before entering power down. Minimum power consumption is achieved in the power-down mode with SCLK disabled and  $\overline{\text{SYNC}}$  and  $D_{\text{IN}}$  idled low. The time to exit power-down (Wake-Up Time) is typically  $t_{\text{WU}}$  μsec as stated in the A.C. and Timing Characteristics Table.

### APPLICATION INFORMATION

The simplicity of the DAC081S101 implies ease of use. However, it is important to recognize that any data converter that utilizes its supply voltage as its reference voltage will have essentially zero PSRR (Power Supply Rejection Ratio). Therefore, it is necessary to provide a noise-free supply voltage to the device.

## DSP/MICROPROCESSOR INTERFACING

Interfacing the DAC081S101 to microprocessors and DSPs is quite simple. The following guidelines are offered to hasten the design process.

### ADSP-2101/ADSP2103 Interfacing

Figure 37 shows a serial interface between the DAC081S101 and the ADSP-2101/ADSP2103. The DSP should be set to operate in the SPORT Transmit Alternate Framing Mode. It is programmed through the SPORT control register and should be configured for Internal Clock Operation, Active Low Framing and 16-bit Word Length. Transmission is started by writing a word to the Tx register after the SPORT mode has been enabled.

Figure 37. ADSP-2101/2103 Interface

### 80C51/80L51 Interface

A serial interface between the DAC081S101 and the 80C51/80L51 microcontroller is shown in Figure 38. The SYNC signal comes from a bit-programmable pin on the microcontroller. The example shown here uses port line P3.3. This line is taken low when data is to be transmitted to the DAC081S101. Since the 80C51/80L51 transmits 8-bit bytes, only eight falling clock edges occur in the transmit cycle. To load data into the DAC, the P3.3 line must be left low after the first eight bits are transmitted. A second write cycle is initiated to transmit the second byte of data, after which port line P3.3 is brought high. The 80C51/80L51 transmit routine must recognize that the 80C51/80L51 transmits data with the LSB first while the DAC081S101 requires data with the MSB first.

Figure 38. 80C51/80L51 Interface

### 68HC11 Interface

A serial interface between the DAC081S101 and the 68HC11 microcontroller is shown in Figure 39. The SYNC line of the DAC081S101 is driven from a port line (PC7 in the figure), similar to the 80C51/80L51.

The 68HC11 should be configured with its CPOL bit as a zero and its CPHA bit as a one. This configuration causes data on the MOSI output to be valid on the falling edge of SCLK. PC7 is taken low to transmit data to the DAC. The 68HC11 transmits data in 8-bit bytes with eight falling clock edges. Data is transmitted with the MSB first. PC7 must remain low after the first eight bits are transferred. A second write cycle is initiated to transmit the second byte of data to the DAC, after which PC7 should be raised to end the write sequence.

Figure 39. 68HC11 Interface

### Microwire Interface

Figure 40 shows an interface between a Microwire compatible device and the DAC081S101. Data is clocked out on the rising edges of the SCLK signal.

Figure 40. Microwire Interface

## USING REFERENCES AS POWER SUPPLIES

Recall the need for a quiet supply source for devices that use their power supply voltage as a reference voltage.

Since the DAC081S101 consumes very little power, a reference source may be used as the supply voltage. The advantages of using a reference source over a voltage regulator are accuracy and stability. Some low noise regulators can also be used for the power supply of the DAC081S101. Listed below are a few power supply options for the DAC081S101.

### LM4130

The LM4130 reference, with its 0.05% accuracy over temperature, is a good choice as a power source for the DAC081S101. Its primary disadvantage is the lack of 3V and 5V versions. However, the 4.096V version is useful if a 0 to 4.095V output range is desirable or acceptable. Bypassing the LM4130 VIN pin with a 0.1 $\mu$ F capacitor and the VOUT pin with a 2.2 $\mu$ F capacitor will improve stability and reduce output noise. The LM4130 comes in a space-saving 5-pin SOT23.

Figure 41. The LM4130 as a power supply

### LM4050

Available with accuracy of 0.44%, the LM4050 shunt reference is also a good choice as a power regulator for the DAC081S101. It does not come in a 3 Volt version, but 4.096V and 5V versions are available. It comes in a space-saving 3-pin SOT-23.

Figure 42. The LM4050 as a power supply

The minimum resistor value in the circuit of [Figure 42](#) should be chosen such that the maximum current through the LM4050 does not exceed its 15 mA rating. The conditions for maximum current include the input voltage at its maximum, the LM4050 voltage at its minimum, the resistor value at its minimum due to tolerance, and the DAC081S101 draws zero current. The maximum resistor value must allow the LM4050 to draw more than its minimum current for regulation plus the maximum DAC081S101 current in full operation. The conditions for minimum current include the input voltage at its minimum, the LM4050 voltage at its maximum, the resistor value at its maximum due to tolerance, and the DAC081S101 draws its maximum current. These conditions can be summarized as

$$R(\min) = (V_{IN}(\max) - V_Z(\min) / (I_A(\min) + I_Z(\max))) \quad (3)$$

and

$$R(\max) = (V_{IN}(\min) - V_Z(\max) / (I_A(\max) + I_Z(\min))) \quad (4)$$

where  $V_Z(\min)$  and  $V_Z(\max)$  are the nominal LM4050 output voltages  $\pm$  the LM4050 output tolerance over temperature,  $I_Z(\max)$  is the maximum allowable current through the LM4050,  $I_Z(\min)$  is the minimum current required by the LM4050 for proper regulation,  $I_A(\max)$  is the maximum DAC081S101 supply current, and  $I_A(\min)$  is the minimum DAC081S101 supply current.

### LP3985

The LP3985 is a low noise, ultra low dropout voltage regulator with a 3% accuracy over temperature. It is a good choice for applications that do not require a precision reference for the DAC081S101. It comes in 3.0V, 3.3V and 5V versions, among others, and sports a low 30  $\mu$ V noise specification at low frequencies. Since low frequency noise is relatively difficult to filter, this specification could be important for some applications. The LP3985 comes in a space-saving 5-pin SOT-23 and 5-bump DSBGA packages.

**Figure 43. Using the LP3985 regulator**

An input capacitance of 1.0 $\mu$ F without any ESR requirement is required at the LP3985 input, while a 1.0 $\mu$ F ceramic capacitor with an ESR requirement of 5m $\Omega$  to 500m $\Omega$  is required at the output. Careful interpretation and understanding of the capacitor specification is required to ensure correct device operation.

### LP2980

The LP2980 is an ultra low dropout regulator with a 0.5% or 1.0% accuracy over temperature, depending upon grade. It is available in 3.0V, 3.3V and 5V versions, among others.

**Figure 44. Using the LP2980 regulator**

Like any low dropout regulator, the LP2980 requires an output capacitor for loop stability. This output capacitor must be at least 1.0µF over temperature, but values of 2.2µF or more will provide even better performance. The ESR of this capacitor should be within the range specified in the LP2980 data sheet. Surface-mount solid tantalum capacitors offer a good combination of small size and ESR. Ceramic capacitors are attractive due to their small size but generally have ESR values that are too low for use with the LP2980. Aluminum electrolytic capacitors are typically not a good choice due to their large size and have ESR values that may be too high at low temperatures.

### BIPOLAR OPERATION

The DAC081S101 is designed for single supply operation and thus has a unipolar output. However, a bipolar output may be obtained with the circuit in Figure 45. This circuit will provide an output voltage range of ±5 Volts. A rail-to-rail amplifier should be used if the amplifier supplies are limited to ±5V.

Figure 45. Bipolar Operation

The output voltage of this circuit for any code is found to be

$$V_O = (V_A \times (D / 256) \times ((R1 + R2) / R1) - V_A \times R2 / R1) \tag{5}$$

where D is the input code in decimal form. With  $V_A = 5V$  and  $R1 = R2$ ,

$$V_O = (10 \times D / 256) - 5V \tag{6}$$

A list of rail-to-rail amplifiers suitable for this application are indicated in Table 3.

Table 3. Some Rail-to-Rail Amplifiers

AMP	PKGS	Typ $V_{OS}$	Typ $I_{SUPPLY}$
LMC7111	PDIP-8 SOT-23-5	0.9 mV	25 µA
LM7301	SO-8 SOT-23-5	0.03 mV	620 µA
LM8261	SOT-23-5	0.7 mV	1 mA

### LAYOUT, GROUNDING, AND BYPASSING

For best accuracy and minimum noise, the printed circuit board containing the DAC081S101 should have separate analog and digital areas. The areas are defined by the locations of the analog and digital power planes. Both of these planes should be located in the same board layer. There should be a single ground plane. A single ground plane is preferred if digital return current does not flow through the analog ground area. Frequently a single ground plane design will utilize a "fencing" technique to prevent the mixing of analog and digital ground current. Separate ground planes should only be utilized when the fencing technique is inadequate. The separate ground planes must be connected in one place, preferably near the DAC081S101. Special care is required to guarantee that digital signals with fast edge rates do not pass over split ground planes. They must always have a continuous return path below their traces.

The DAC081S101 power supply should be bypassed with a 10µF and a 0.1µF capacitor as close as possible to the device with the 0.1µF right at the device supply pin. The 10µF capacitor should be a tantalum type and the 0.1µF capacitor should be a low ESL, low ESR type. The power supply for the DAC081S101 should only be used for analog circuits.

Avoid crossover of analog and digital signals and keep the clock and data lines on the component side of the board. The clock and data lines should have controlled impedances.

### REVISION HISTORY

Changes from Revision B (February 2013) to Revision C	Page
• Changed layout of National Data Sheet to TI format .....	<a href="#">19</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
