## ADC12DC105 Dual 12-Bit, 105 MSPS A/D Converter with CMOS Outputs

Check for Samples: ADC12DC105

## FEATURES

- Internal Sample-and-Hold Circuit and Precision Reference
- Low Power Consumption
- Clock Duty Cycle Stabilizer
- Single +3.0 V or +3.3 V Supply Operation
- Power-Down Mode
- Offset Binary or 2's Complement Output Data Format
- 60-Pin WQFN Package, ( $9 \times 9 \times 0.8 \mathrm{~mm}, 0.5 \mathrm{~mm}$ Pin-Pitch)

## KEY SPECIFICATIONS

- Resolution: 12 Bits
- Conversion Rate: $\mathbf{1 0 5}$ MSPS
- SNR ( $\mathrm{f}_{\mathrm{IN}}=170 \mathrm{MHz}$ ): 69 dBFS (Typ)
- SFDR ( $\mathrm{f}_{\mathrm{N}}=170 \mathrm{MHz}$ ): 83 dBFS (Typ)
- Full Power Bandwidth: $\mathbf{1 ~ G H z}$ (Typ)
- Power Consumption
- 690 mW (Typ), $\mathrm{V}_{\mathrm{A}}=3.0 \mathrm{~V}$
- 800 mW (Typ), $\mathrm{V}_{\mathrm{A}}=3.3 \mathrm{~V}$

## DESCRIPTION

The ADC12DC105 is a high-performance CMOS analog-to-digital converter capable of converting two analog input signals into 12 -bit digital words at rates up to 105 Mega Samples Per Second (MSPS). These converters use a differential, pipelined architecture with digital error correction and an on-chip sample-and-hold circuit to minimize power consumption and the external component count, while providing excellent dynamic performance. A unique sample-and-hold stage yields a full-power bandwidth of 1 GHz . The ADC12DC080/105 may be operated from a single +3.0 V or +3.3 V power supply. A power-down feature reduces the power consumption to very low levels while still allowing fast wake-up time to full operation. The differential inputs provide a 2 V full scale differential input swing. A stable 1.2 V internal voltage reference is provided, or the ADC12DC105 can be operated with an external 1.2 V reference. Output data format (offset binary versus 2 's complement) and duty cycle stabilizer are pinselectable. The duty cycle stabilizer maintains performance over a wide range of clock duty cycles.
The ADC12DC105 is available in a 60 -lead WQFN package and operates over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## APPLICATIONS

- High IF Sampling Receivers
- Wireless Base Station Receivers
- Test and Measurement Equipment
- Communications Instrumentation
- Portable Instrumentation

PIN DESCRIPTIONS

## PIN DESCRIPTIONS (continued)

| Pin No. | Symbol | Equivalent Circuit |  | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} 42-49, \\ 52-55 \end{gathered}$ | $\begin{aligned} & \text { DAO-DA7, } \\ & \text { DA8-DA11 } \end{aligned}$ |  |  | Digital data output pins that make up the 12-bit conversion result for Channel A. DA0 (pin 42) is the LSB, while DA11 (pin 55) is the MSB of the output word. Output levels are CMOS compatible. |
| $\begin{aligned} & \text { 23-24, } \\ & 27-36 \end{aligned}$ | $\begin{aligned} & \text { DB0-DB1, } \\ & \text { DB3-DB11 } \end{aligned}$ |  |  | Digital data output pins that make up the 12 -bit conversion result for Channel B. DB0 (pin 23) is the LSB, while DB11 (pin 36) is the MSB of the output word. Output levels are CMOS compatible. |
| 39 | DRDY |  |  | Data Ready Strobe. The data output transition is synchronized with the falling edge of this signal. This signal switches at the same frequency as the CLK input. |
| ANALOG POWER |  |  |  |  |
| $\begin{gathered} 8,16,17,58, \\ 60 \end{gathered}$ | $\mathrm{V}_{\text {A }}$ |  |  | Positive analog supply pins. These pins should be connected to a quiet source and be bypassed to AGND with $0.1 \mu \mathrm{~F}$ capacitors located close to the power pins. |
| 1, 4, 12, 15, <br> Exposed Pad | AGND |  |  | The ground return for the analog supply. The exposed pad on back of package must be soldered to ground plane to ensure rated performance. |
| DIGITAL POWER |  |  |  |  |
| 26, 38,50 | $V_{\text {DR }}$ |  |  | Positive driver supply pin for the output drivers. This pin should be connected to a quiet voltage source and be bypassed to DRGND with a $0.1 \mu \mathrm{~F}$ capacitor located close to the power pin. |
| 25, 37, 51 | DRGND |  |  | The ground return for the digital output driver supply. This pins should be connected to the system digital ground, but not be connected in close proximity to the ADC's AGND pins. |

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## Absolute Maximum Ratings ${ }^{(1)(2)(3)(4)(5)}$

| Supply Voltage ( $\mathrm{V}_{\mathrm{A}}, \mathrm{V}_{\mathrm{DR}}$ ) | -0.3 V to 4.2 V |
| :--- | ---: |
| Voltage on Any Pin (Not to exceed 4.2V) | -0.3 V to $\left(\mathrm{V}_{\mathrm{A}}+0.3 \mathrm{~V}\right)$ |
| Input Current at Any Pin other than Supply Pins ${ }^{(6)}$ |  |
| Package Input Current ${ }^{(6)}$ | $\pm 5 \mathrm{~mA}$ |
| Max Junction Temp $\left(\mathrm{T}_{\mathrm{J}}\right)$ | $\pm 50 \mathrm{~mA}$ |
| Thermal Resistance $\left(\theta_{\mathrm{JA}}\right)$ | $+150^{\circ} \mathrm{C}$ |
| ESD Rating | Human Body Model $^{(7)}$ |
|  | Machine Model ${ }^{(7)}$ |

(1) All voltages are measured with respect to GND $=\mathrm{AGND}=\mathrm{DRGND}=0 \mathrm{~V}$, unless otherwise specified.
(2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is specified to be functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions. Operation of the device beyond the maximum Operating Ratings is not recommended.
(3) Soldering process must comply with Reflow Temperature Profile specifications. Refer to www.ti.com/packaging.
(4) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
(5) Reflow temperature profiles are different for lead-free and non-lead-free packages.
(6) When the input voltage at any pin exceeds the power supplies (that is, $\mathrm{V}_{\mathbb{I N}}<A G N D$, or $\mathrm{V}_{\mathbb{I N}}>\mathrm{V}_{\mathrm{A}}$ ), the current at that pin should be limited to $\pm 5 \mathrm{~mA}$. The $\pm 50 \mathrm{~mA}$ maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of $\pm 5 \mathrm{~mA}$ to 10 .
(7) Human Body Model is 100 pF discharged through a $1.5 \mathrm{k} \Omega$ resistor. Machine Model is 220 pF discharged through $0 \Omega$.

Operating Ratings ${ }^{(1)(2)}$

| Operating Temperature | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ |  |
| :--- | ---: | ---: |
| Supply Voltage $\left(\mathrm{V}_{\mathrm{A}}\right)$ | +2.7 V to +3.6 V |  |
| Output Driver Supply $\left(\mathrm{V}_{\mathrm{DR}}\right)$ | +2.4 V to $\mathrm{V}_{\mathrm{A}}$ |  |
| Clock Duty Cycle | (DCS Enabled) | $30 / 70 \%$ |
|  | (DCS Disabled) | $45 / 55 \%$ |
| $\mathrm{~V}_{\mathrm{CM}}$ | 1.4 V to 1.6 V |  |
| AGND-DRGND | $\leq 100 \mathrm{mV}$ |  |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is specified to be functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions. Operation of the device beyond the maximum Operating Ratings is not recommended.
(2) All voltages are measured with respect to GND $=\mathrm{AGND}=\mathrm{DRGND}=0 \mathrm{~V}$, unless otherwise specified.

## Converter Electrical Characteristics

Unless otherwise specified, the following specifications apply: AGND $=\mathrm{DRGND}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{A}}=+3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DR}}=+2.5 \mathrm{~V}$, Internal $\mathrm{V}_{\text {REF }}$ $=+1.2 \mathrm{~V}, \mathrm{f}_{\text {CLK }}=105 \mathrm{MHz}, \mathrm{V}_{\text {CM }}=\mathrm{V}_{\text {CMO }}, \mathrm{C}_{\mathrm{L}}=5 \mathrm{pF} /$ pin. Typical values are for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Boldface limits apply for $\mathrm{T}_{\text {MIN }} \leq \mathrm{T}_{\mathrm{A}} \leq$ $\mathrm{T}_{\text {Max }}$. All other limits apply for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}^{(1)(2)(3)}$

| Parameter |  | Test Conditions | Typical ${ }^{(4)}$ | Limits | Units (Limits) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| STATIC CONVERTER CHARACTERISTICS |  |  |  |  |  |
|  | Resolution with No Missing Codes |  |  | 12 | Bits (min) |
| INL | Integral Non Linearity ${ }^{(5)}$ |  | $\pm 0.5$ | 1.1 | LSB (max) |
|  |  |  |  | -1.1 | LSB (min) |
| DNL | Differential Non Linearity |  | $\pm 0.2$ | 0.55 | LSB (max) |
|  |  |  |  | -0.55 | LSB (min) |
| PGE | Positive Gain Error |  | -0.1 | $\pm 1$ | \%FS (max) |
| NGE | Negative Gain Error |  | 0.18 | $\pm 1$ | \%FS (max) |
| TC PGE | Positive Gain Error Tempco | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ | -3 |  | ppm/ ${ }^{\circ} \mathrm{C}$ |
| TC NGE | Negative Gain Error Tempco | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ | -7 |  | ppm/ ${ }^{\circ} \mathrm{C}$ |
| VofF | Offset Error |  | 0.01 | $\pm 0.55$ | \%FS (max) |
| TC V ${ }_{\text {OFF }}$ | Offset Error Tempco | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ | -4 |  | ppm/ ${ }^{\circ} \mathrm{C}$ |
|  | Under Range Output Code |  | 0 | 0 |  |
|  | Over Range Output Code |  | 4095 | 4095 |  |

(1) The inputs are protected as shown below. Input voltage magnitudes above $\mathrm{V}_{\mathrm{A}}$ or below GND will not damage this device, provided current is limited. However, errors in the A/D conversion can occur if the input goes above 2.6 V or below GND as described in the Operating Ratings section.

(2) With a full scale differential input of $2 \mathrm{~V}_{\text {P-P }}$, the 12 -bit LSB is $488 \mu \mathrm{~V}$.
(3) When the input voltage at any pin exceeds the power supplies (that is, $\mathrm{V}_{\mathbb{I N}}<A G N D$, or $\mathrm{V}_{I N}>\mathrm{V}_{\mathrm{A}}$ ), the current at that pin should be limited to $\pm 5 \mathrm{~mA}$. The $\pm 50 \mathrm{~mA}$ maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of $\pm 5 \mathrm{~mA}$ to 10 .
(4) Typical figures are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ and represent most likely parametric norms at the time of product characterization. The typical specifications are not ensured.
(5) Integral Non Linearity is defined as the deviation of the analog value, expressed in LSBs, from the straight line that passes through positive and negative full-scale.

## Converter Electrical Characteristics (continued)

Unless otherwise specified, the following specifications apply: AGND = DRGND $=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{A}}=+3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DR}}=+2.5 \mathrm{~V}$, Internal $\mathrm{V}_{\text {REF }}$ $=+1.2 \mathrm{~V}, \mathrm{f}_{\mathrm{CLK}}=105 \mathrm{MHz}, \mathrm{V}_{\mathrm{CM}}=\mathrm{V}_{\mathrm{CMO}}, \mathrm{C}_{\mathrm{L}}=5 \mathrm{pF} /$ pin. Typical values are for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Boldface limits apply for $\mathrm{T}_{\text {MIN }} \leq \mathrm{T}_{\mathrm{A}} \leq$ $\mathrm{T}_{\text {MAX }}$. All other limits apply for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}^{(1)(2)(3)}$

(6) The input capacitance is the sum of the package/pin capacitance and the sample and hold circuit capacitance.

## Dynamic Converter Electrical Characteristics

Unless otherwise specified, the following specifications apply: AGND = DRGND $=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{A}}=+3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DR}}=+2.5 \mathrm{~V}$, Internal $\mathrm{V}_{\mathrm{REF}}$ $=+1.2 \mathrm{~V}, \mathrm{f}_{\text {CLK }}=105 \mathrm{MHz}, \mathrm{V}_{\mathrm{CM}}=\mathrm{V}_{\mathrm{CMO}}, \mathrm{C}_{\mathrm{L}}=5 \mathrm{pF} /$ pin, . Typical values are for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Boldface limits apply for $\mathrm{T}_{\text {MIN }} \leq \mathrm{T}_{\mathrm{A}}$ $\leq \mathrm{T}_{\text {MAX }}$. All other limits apply for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}^{(1)(2)}$

|  | Power Down Power Consumption | $P D \_A=P D_{-}=V_{A}$ | 33 |  | mW |

(5) $I_{D R}$ is the current consumed by the switching of the output drivers and is primarily determined by load capacitance on the output pins, the supply voltage, $V_{D R}$, and the rate at which the outputs are switching (which is signal dependent). $I_{D R}=V_{D R}\left(C_{0} \times f_{0}+C_{1} \times f_{1}+\ldots . C_{11} \times\right.$ $f_{11}$ ) where $V_{D R}$ is the output driver power supply voltage, $C_{n}$ is total capacitance on the output pin, and $f_{n}$ is the average frequency at which that pin is toggling.

## Timing and AC Characteristics

Unless otherwise specified, the following specifications apply: AGND = DRGND $=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{A}}=+3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DR}}=+2.5 \mathrm{~V}$, Internal $\mathrm{V}_{\mathrm{REF}}$ $=+1.2 \mathrm{~V}, \mathrm{f}_{\mathrm{CLK}}=105 \mathrm{MHz}, \mathrm{V}_{\mathrm{CM}}=\mathrm{V}_{\mathrm{CMO}}, \mathrm{C}_{\mathrm{L}}=5 \mathrm{pF} /$ pin. Typical values are for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Timing measurements are taken at $50 \%$ of the signal amplitude. Boldface limits apply for $T_{\text {MIN }} \leq T_{A} \leq T_{\text {MAX }}$. All other limits apply for $T_{A}=25^{\circ} C^{(1)(2)(3)}$

| Parameter |  | Test Conditions | Typical ${ }^{(4)}$ | Limits | Units (Limits) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Maximum Clock Frequency |  |  | 105 | MHz (max) |
|  | Minimum Clock Frequency |  |  | 20 | MHz ( min ) |
| $\mathrm{t}_{\mathrm{CH}}$ | Clock High Time |  | 4 |  | ns |
| $\mathrm{t}_{\mathrm{CL}}$ | Clock Low Time |  | 4 |  | ns |
| $\mathrm{t}_{\text {CONV }}$ | Conversion Latency |  |  | 7 | Clock Cycles |
| tod | Output Delay of CLK to DATA | Relative to rising edge of CLK | 6.7 | $\begin{aligned} & 4.6 \\ & 8.8 \\ & \hline \end{aligned}$ | ns (min) ns (max) |
| tsu | Data Output Setup Time | Relative to DRDY | 4 | 3 | ns (min) |
| $\mathrm{t}_{\mathrm{H}}$ | Data Output Hold Time | Relative to DRDY | 5.5 | 3.8 | ns (min) |
| $\mathrm{t}_{\text {AD }}$ | Aperture Delay |  | 0.6 |  | ns |
| $\mathrm{t}_{\mathrm{AJ}}$ | Aperture Jitter |  | 0.1 |  | ps rms |

(1) The inputs are protected as shown below. Input voltage magnitudes above $\mathrm{V}_{\mathrm{A}}$ or below GND will not damage this device, provided current is limited. However, errors in the A/D conversion can occur if the input goes above 2.6 V or below GND as described in the Operating Ratings section.

(2) With a full scale differential input of $2 \mathrm{~V}_{\mathrm{P}-\mathrm{P}}$, the 12 -bit LSB is $488 \mu \mathrm{~V}$.
(3) When the input voltage at any pin exceeds the power supplies (that is, $\mathrm{V}_{\mathbb{I N}}<A G N D$, or $\mathrm{V}_{\mathbb{I N}}>\mathrm{V}_{\mathrm{A}}$ ), the current at that pin should be limited to $\pm 5 \mathrm{~mA}$. The $\pm 50 \mathrm{~mA}$ maximum package input current rating limits the number of pins that can safely exceed the power supplies with an input current of $\pm 5 \mathrm{~mA}$ to 10 .
(4) Typical figures are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ and represent most likely parametric norms at the time of product characterization. The typical specifications are not ensured.

## Specification Definitions

APERTURE DELAY is the time after the falling edge of the clock to when the input signal is acquired or held for conversion.

APERTURE JITTER (APERTURE UNCERTAINTY) is the variation in aperture delay from sample to sample. Aperture jitter manifests itself as noise in the output.
CLOCK DUTY CYCLE is the ratio of the time during one cycle that a repetitive digital waveform is high to the total time of one period. The specification here refers to the ADC clock input signal.
COMMON MODE VOLTAGE $\left(\mathrm{V}_{\mathbf{C M}}\right)$ is the common DC voltage applied to both input terminals of the ADC.
CONVERSION LATENCY is the number of clock cycles between initiation of conversion and when that data is presented to the output driver stage. Data for any given sample is available at the output pins the Pipeline Delay plus the Output Delay after the sample is taken. New data is available at every clock cycle, but the data lags the conversion by the pipeline delay.
CROSSTALK is coupling of energy from one channel into the other channel.
DIFFERENTIAL NON-LINEARITY (DNL) is the measure of the maximum deviation from the ideal step size of 1 LSB.

EFFECTIVE NUMBER OF BITS (ENOB, or EFFECTIVE BITS) is another method of specifying Signal-to-Noise and Distortion Ratio or SINAD. ENOB is defined as (SINAD - 1.76) / 6.02 and says that the converter is equivalent to a perfect ADC of this (ENOB) number of bits.
FULL POWER BANDWIDTH is a measure of the frequency at which the reconstructed output fundamental drops 3 dB below its low frequency value for a full scale input.
GAIN ERROR is the deviation from the ideal slope of the transfer function. It can be calculated as:
Gain Error = Positive Full Scale Error - Negative Full Scale Error
It can also be expressed as Positive Gain Error and Negative Gain Error, which are calculated as:
PGE = Positive Full Scale Error - Offset Error NGE = Offset Error - Negative Full Scale Error
INTEGRAL NON LINEARITY (INL) is a measure of the deviation of each individual code from a best fit straight line. The deviation of any given code from this straight line is measured from the center of that code value.
INTERMODULATION DISTORTION (IMD) is the creation of additional spectral components as a result of two sinusoidal frequencies being applied to the ADC input at the same time. It is defined as the ratio of the power in the intermodulation products to the total power in the original frequencies. IMD is usually expressed in dBFS.
LSB (LEAST SIGNIFICANT BIT) is the bit that has the smallest value or weight of all bits. This value is $\mathrm{V}_{\mathrm{Fs}} / 2^{n}$, where " $V_{F S}$ " is the full scale input voltage and " $n$ " is the ADC resolution in bits.
MISSING CODES are those output codes that will never appear at the ADC outputs. The ADC is ensured not to have any missing codes.
MSB (MOST SIGNIFICANT BIT) is the bit that has the largest value or weight. Its value is one half of full scale.
NEGATIVE FULL SCALE ERROR is the difference between the actual first code transition and its ideal value of $1 / 2$ LSB above negative full scale.
OFFSET ERROR is the difference between the two input voltages $\left[\left(\mathrm{V}_{\mathbb{N N}^{+}}\right)-\left(\mathrm{V}_{\mathbb{I N}^{-}}\right)\right]$required to cause a transition from code 2047 to 2048.
OUTPUT DELAY is the time delay after the falling edge of the clock before the data update is presented at the output pins.
PIPELINE DELAY (LATENCY) See CONVERSION LATENCY.
POSITIVE FULL SCALE ERROR is the difference between the actual last code transition and its ideal value of $11 / 2$ LSB below positive full scale.
POWER SUPPLY REJECTION RATIO (PSRR) is a measure of how well the ADC rejects a change in the power supply voltage. PSRR is the ratio of the Full-Scale output of the ADC with the supply at the minimum DC supply limit to the Full-Scale output of the ADC with the supply at the maximum DC supply limit, expressed in dB.

SIGNAL TO NOISE RATIO (SNR) is the ratio, expressed in dB, of the rms value of the input signal to the rms value of the sum of all other spectral components below one-half the sampling frequency, not including harmonics or DC.

SIGNAL TO NOISE PLUS DISTORTION (S/N+D or SINAD) Is the ratio, expressed in dB, of the rms value of the input signal to the rms value of all of the other spectral components below half the clock frequency, including harmonics but excluding d.c.
SPURIOUS FREE DYNAMIC RANGE (SFDR) is the difference, expressed in dB , between the rms values of the input signal and the peak spurious signal, where a spurious signal is any signal present in the output spectrum that is not present at the input.
TOTAL HARMONIC DISTORTION (THD) is the ratio, expressed in dB , of the rms total of the first six harmonic levels at the output to the level of the fundamental at the output. THD is calculated as:

$$
\begin{equation*}
T H D=20 \times \log \sqrt{\frac{f_{2}{ }^{2}+\ldots+f_{7}{ }^{2}}{f_{1}{ }^{2}}} \tag{3}
\end{equation*}
$$

where $f_{1}$ is the RMS power of the fundamental (output) frequency and $f_{2}$ through $f_{7}$ are the RMS power of the first 6 harmonic frequencies in the output spectrum.
SECOND HARMONIC DISTORTION (2ND HARM) is the difference expressed in dB, between the RMS power in the input frequency at the output and the power in its 2nd harmonic level at the output.
THIRD HARMONIC DISTORTION (3RD HARM) is the difference, expressed in dB, between the RMS power in the input frequency at the output and the power in its 3rd harmonic level at the output.

## FUNCTIONAL DESCRIPTION

Operating on a single +3.0 V or +3.3 V supply, the ADC12DC105 digitizes two differential analog input signals to 12 bits, using a differential pipelined architecture with error correction circuitry and an on-chip sample-and-hold circuit to ensure maximum performance. The user has the choice of using an internal 1.2 V stable reference, or using an external 1.2 V reference. Any external reference is buffered on-chip to ease the task of driving that pin. Duty cycle stabilization and output data format are selectable using the quad state function OF/DCS pin (pin 19). The output data can be set for offset binary or two's complement.

## APPLICATIONS INFORMATION

## OPERATING CONDITIONS

We recommend that the following conditions be observed for operation of the ADC12DC105:

$$
\begin{aligned}
& 2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{A}} \leq 3.6 \mathrm{~V} \\
& 2.4 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DR}} \leq \mathrm{V}_{\mathrm{A}} \\
& 20 \mathrm{MHz} \leq \mathrm{f}_{\mathrm{CLK}} \leq 105 \mathrm{MHz} \\
& 1.2 \mathrm{~V} \text { internal reference } \\
& \mathrm{V}_{\text {REF }}=1.2 \mathrm{~V} \text { (for an external reference) } \\
& \mathrm{V}_{\mathrm{CM}}=1.5 \mathrm{~V} \text { (from } \mathrm{V}_{\mathrm{CMO}} \text { ) }
\end{aligned}
$$

## ANALOG INPUTS

## Signal Inputs

## Differential Analog Input Pins

The ADC12DC105 has a pair of analog signal input pins for each of two channels. $\mathrm{V}_{\mathbb{I N}^{+}}$and $\mathrm{V}_{\mathbb{I N}^{-}}$form a differential input pair. The input signal, $\mathrm{V}_{\mathrm{IN}_{\mathrm{N}}}$, is defined as:

$$
\begin{equation*}
\mathrm{V}_{\mathbb{N}}=\left(\mathrm{V}_{\mathbb{N}}+\right)-\left(\mathrm{V}_{\mathbb{N}^{-}}\right) \tag{4}
\end{equation*}
$$

Figure 18 shows the expected input signal range. Note that the common mode input voltage, $\mathrm{V}_{\mathrm{CM}}$, should be 1.5 V . Using $\mathrm{V}_{\text {смо }}$ (pins 7,9 ) for $\mathrm{V}_{\text {см }}$ will ensure the proper input common mode level for the analog input signal. The positive peaks of the individual input signals should each never exceed 2.6 V . Each analog input pin of the differential pair should have a maximum peak-to-peak voltage of 1 V , be $180^{\circ}$ out of phase with each other and be centered around $\mathrm{V}_{\text {CM }}$.The peak-to-peak voltage swing at each analog input pin should not exceed the 1V or the output data will be clipped.

(a) Differential Input

(b) Single-Ended Input

Figure 18. Expected Input Signal Range

For single frequency sine waves the full scale error in LSB can be described as approximately:
$\mathrm{E}_{\mathrm{FS}}=4096\left(1-\sin \left(90^{\circ}+\mathrm{dev}\right)\right)$
where

- dev is the angular difference in degrees between the two signals having a $180^{\circ}$ relative phase relationship to each other (see Figure 19)

For single frequency inputs, angular errors result in a reduction of the effective full scale input. For complex waveforms, however, angular errors will result in distortion.

Figure 19. Angular Errors Between the Two Input Signals Will Reduce the Output Level or Cause Distortion

It is recommended to drive the analog inputs with a source impedance less than $100 \Omega$. Matching the source impedance for the differential inputs will improve even ordered harmonic performance (particularly second harmonic).

Table 1 indicates the input to output relationship of the ADC12DC105.
Table 1. Input to Output Relationship

| $\mathrm{V}_{\text {IN }^{+}}$ | $\mathrm{V}_{\text {IN }}$ | Binary Output | 2's Complement Output |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{CM}}-\mathrm{V}_{\text {REF }} / 2$ | $\mathrm{~V}_{\mathrm{CM}}+\mathrm{V}_{\mathrm{REF}} / 2$ | 000000000000 | 100000000000 | Negative Full-Scale |
| $\mathrm{V}_{\mathrm{CM}}-\mathrm{V}_{\mathrm{REF}} / 4$ | $\mathrm{~V}_{\mathrm{CM}}+\mathrm{V}_{\mathrm{REF}} / 4$ | 010000000000 | 110000000000 |  |
| $\mathrm{~V}_{\mathrm{CM}}$ | $\mathrm{V}_{\mathrm{CM}}$ | 100000000000 | 000000000000 | Mid-Scale |
| $\mathrm{V}_{\mathrm{CM}}+\mathrm{V}_{\mathrm{REF}} / 4$ | $\mathrm{~V}_{\mathrm{CM}}-\mathrm{V}_{\text {REF }} / 4$ | 110000000000 | 010000000000 |  |

## Driving the Analog Inputs

The $\mathrm{V}_{\mathbb{N}^{+}}$and the $\mathrm{V}_{\mathbb{I N}}$ - inputs of the ADC12DC105 have an internal sample-and-hold circuit which consists of an analog switch followed by a switched-capacitor amplifier.

Figure 20 and Figure 21 show examples of single-ended to differential conversion circuits. The circuit in Figure 20 works well for input frequencies up to approximately 70 MHz , while the circuit in Figure 21 works well above 70 MHz .

Figure 20. Low Input Frequency Transformer Drive Circuit

Figure 21. High Input Frequency Transformer Drive Circuit
One short-coming of using a transformer to achieve the single-ended to differential conversion is that most RF transformers have poor low frequency performance. A differential amplifier can be used to drive the analog inputs for low frequency applications. The amplifier must be fast enough to settle from the charging glitches on the analog input resulting from the sample-and-hold operation before the clock goes high and the sample is passed to the ADC core.

## Input Common Mode Voltage

The input common mode voltage, $\mathrm{V}_{\mathrm{CM}}$, should be in the range of 1.4 V to 1.6 V and be a value such that the peak excursions of the analog signal do not go more negative than ground or more positive than 2.6 V . It is recommended to use $\mathrm{V}_{\mathrm{CMO}}$ (pins 7,9 ) as the input common mode voltage.
If the $A D C 12 D C 105$ is operated with $V_{A}=3.6 \mathrm{~V}$, a resistor of approximately $1 \mathrm{~K} \Omega$ should be used from the $\mathrm{V}_{\text {Cмо }}$ pin to AGND. This will help maintain stability over the entire temperature range when using a high supply voltage.

## Reference Pins

The ADC12DC105 is designed to operate with an internal or external 1.2 V reference. The internal 1.2 Volt reference is the default condition when no external reference input is applied to the $\mathrm{V}_{\text {REF }}$ pin. If a voltage is applied to the $\mathrm{V}_{\text {REF }}$ pin, then that voltage is used for the reference. The $\mathrm{V}_{\text {REF }}$ pin should always be bypassed to ground with a $0.1 \mu \mathrm{~F}$ capacitor close to the reference input pin. Do not load this pin when using the internal reference.

It is important that all grounds associated with the reference voltage and the analog input signal make connection to the ground plane at a single, quiet point to minimize the effects of noise currents in the ground path.
The Reference Bypass Pins ( $\mathrm{V}_{\mathrm{RP}}, \mathrm{V}_{\mathrm{CMO}}$, and $\mathrm{V}_{\mathrm{RN}}$ ) for channels A and B are made available for bypass purposes. These pins should each be bypassed to AGND with a low ESL (equivalent series inductance) $0.1 \mu \mathrm{~F}$ capacitor placed very close to the pin to minimize stray inductance. A $0.1 \mu \mathrm{~F}$ capacitor should be placed between $\mathrm{V}_{\mathrm{RP}}$ and $\mathrm{V}_{\mathrm{RN}}$ as close to the pins as possible, and a $1 \mu \mathrm{~F}$ capacitor should be placed in parallel. This configuration is shown in Figure 22. It is necessary to avoid reference oscillation, which could result in reduced SFDR and/or SNR. $\mathrm{V}_{\mathrm{CMO}}$ may be loaded to 1 mA for use as a temperature stable 1.5 V reference. The remaining pins should not be loaded.

Smaller capacitor values than those specified will allow faster recovery from the power down mode, but may result in degraded noise performance. Loading any of these pins, other than $\mathrm{V}_{\text {смо }}$ may result in performance degradation.
The nominal voltages for the reference bypass pins are as follows:

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{CMO}}=1.5 \mathrm{~V} \\
& \mathrm{~V}_{\mathrm{RP}}=2.0 \mathrm{~V} \\
& \mathrm{~V}_{\mathrm{RN}}=1.0 \mathrm{~V}
\end{aligned}
$$

## OF/DCS Pin

Duty cycle stabilization and output data format are selectable using this quad state function pin. When enabled, duty cycle stabilization can compensate for clock inputs with duty cycles ranging from $30 \%$ to $70 \%$ and generate a stable internal clock, improving the performance of the part. With OF/DCS $=\mathrm{V}_{\mathrm{A}}$ the output data format is 2's complement and duty cycle stabilization is not used. With OF/DCS = AGND the output data format is offset binary and duty cycle stabilization is not used. With OF/DCS $=(2 / 3)^{*} V_{A}$ the output data format is 2's complement and duty cycle stabilization is applied to the clock. If OF/DCS is $(1 / 3)^{*} V_{A}$ the output data format is offset binary and duty cycle stabilization is applied to the clock. While the sense of this pin may be changed "on the fly," doing this is not recommended as the output data could be erroneous for a few clock cycles after this change is made.
Note: This signal has no effect when SPI_EN is high and the serial control interface is enabled.

## DIGITAL INPUTS

Digital CMOS compatible inputs consist of CLK, PD_A, and PD_B.

## Clock Input

The CLK controls the timing of the sampling process. To achieve the optimum noise performance, the clock input should be driven with a stable, low jitter clock signal in the range indicated in the Electrical Table. The clock input signal should also have a short transition region. This can be achieved by passing a low-jitter sinusoidal clock source through a high speed buffer gate. The trace carrying the clock signal should be as short as possible and should not cross any other signal line, analog or digital, not even at $90^{\circ}$.
The clock signal also drives an internal state machine. If the clock is interrupted, or its frequency is too low, the charge on the internal capacitors can dissipate to the point where the accuracy of the output data will degrade. This is what limits the minimum sample rate.
The clock line should be terminated at its source in the characteristic impedance of that line. Take care to maintain a constant clock line impedance throughout the length of the line. Refer to Application Note AN-905 (SNLA035) for information on setting characteristic impedance.
It is highly desirable that the the source driving the ADC clock pins only drive that pin. However, if that source is used to drive other devices, then each driven pin should be AC terminated with a series RC to ground, such that the resistor value is equal to the characteristic impedance of the clock line and the capacitor value is:

$$
C \geq \frac{4 \times t_{P D} \times L}{Z_{0}}
$$

where

- $\mathrm{t}_{\mathrm{PD}}$ is the signal propagation rate down the clock line
- "L" is the line length
- $\mathrm{Z}_{0}$ is the characteristic impedance of the clock line

This termination should be as close as possible to the ADC clock pin but beyond it as seen from the clock source. Typical $t_{p D}$ is about $150 \mathrm{ps} / \mathrm{inch}\left(60 \mathrm{ps} / \mathrm{cm}\right.$ ) on FR-4 board material. The units of "L" and $t_{\text {PD }}$ should be the same (inches or centimeters).
The duty cycle of the clock signal can affect the performance of the A/D Converter. Because achieving a precise duty cycle is difficult, the ADC12DC105 has a Duty Cycle Stabilizer.

## DIGITAL OUTPUTS

Digital outputs consist of the CMOS signals DA0-DA11, DB0-DB11, and DRDY.
The ADC12DC105 has 12 CMOS compatible data output pins corresponding to the converted input value for each channel, and a data ready (DRDY) signal that should be used to capture the output data. Valid data is present at these outputs while the PD pin is low. Data should be captured and latched with the rising edge of the DRDY signal.
Be very careful when driving a high capacitance bus. The more capacitance the output drivers must charge for each conversion, the more instantaneous digital current flows through $\mathrm{V}_{\mathrm{DR}}$ and DRGND. These large charging current spikes can cause on-chip ground noise and couple into the analog circuitry, degrading dynamic performance. Adequate bypassing, limiting output capacitance and careful attention to the ground plane will reduce this problem. The result could be an apparent reduction in dynamic performance.

Figure 22. Application Circuit

## POWER SUPPLY CONSIDERATIONS

The power supply pins should be bypassed with a $0.1 \mu \mathrm{~F}$ capacitor and with a 100 pF ceramic chip capacitor close to each power pin. Leadless chip capacitors are preferred because they have low series inductance.

As is the case with all high-speed converters, the ADC12DC105 is sensitive to power supply noise. Accordingly, the noise on the analog supply pin should be kept below 100 mV p-p.
No pin should ever have a voltage on it that is in excess of the supply voltages, not even on a transient basis. Be especially careful of this during power turn on and turn off.

## LAYOUT AND GROUNDING

Proper grounding and proper routing of all signals are essential to ensure accurate conversion. Maintaining separate analog and digital areas of the board, with the ADC12DC105 between these areas, is required to achieve specified performance.

Capacitive coupling between the typically noisy digital circuitry and the sensitive analog circuitry can lead to poor performance. The solution is to keep the analog circuitry separated from the digital circuitry, and to keep the clock line as short as possible.

Since digital switching transients are composed largely of high frequency components, total ground plane copper weight will have little effect upon the logic-generated noise. This is because of the skin effect. Total surface area is more important than is total ground plane area.
Generally, analog and digital lines should cross each other at $90^{\circ}$ to avoid crosstalk. To maximize accuracy in high speed, high resolution systems, however, avoid crossing analog and digital lines altogether. It is important to keep clock lines as short as possible and isolated from ALL other lines, including other digital lines. Even the generally accepted $90^{\circ}$ crossing should be avoided with the clock line as even a little coupling can cause problems at high frequencies. This is because other lines can introduce jitter into the clock line, which can lead to degradation of SNR. Also, the high speed clock can introduce noise into the analog chain.

Best performance at high frequencies and at high resolution is obtained with a straight signal path. That is, the signal path through all components should form a straight line wherever possible.
Be especially careful with the layout of inductors and transformers. Mutual inductance can change the characteristics of the circuit in which they are used. Inductors and transformers should not be placed side by side, even with just a small part of their bodies beside each other. For instance, place transformers for the analog input and the clock input at $90^{\circ}$ to one another to avoid magnetic coupling.
The analog input should be isolated from noisy signal traces to avoid coupling of spurious signals into the input. Any external component (e.g., a filter capacitor) connected between the converter's input pins and ground or to the reference input pin and ground should be connected to a very clean point in the ground plane.
All analog circuitry (input amplifiers, filters, reference components, etc.) should be placed in the analog area of the board. All digital circuitry and dynamic I/O lines should be placed in the digital area of the board. The ADC12DC105 should be between these two areas. Furthermore, all components in the reference circuitry and the input signal chain that are connected to ground should be connected together with short traces and enter the ground plane at a single, quiet point. All ground connections should have a low inductance path to ground.

## DYNAMIC PERFORMANCE

To achieve the best dynamic performance, the clock source driving the CLK input must have a sharp transition region and be free of jitter. Isolate the ADC clock from any digital circuitry with buffers, as with the clock tree shown in Figure 23. The gates used in the clock tree must be capable of operating at frequencies much higher than those used if added jitter is to be prevented.

As mentioned in Section Clock Input, it is good practice to keep the ADC clock line as short as possible and to keep it well away from any other signals. Other signals can introduce jitter into the clock signal, which can lead to reduced SNR performance, and the clock can introduce noise into other lines. Even lines with $90^{\circ}$ crossings have capacitive coupling, so try to avoid even these $90^{\circ}$ crossings of the clock line.

Figure 23. Isolating the ADC Clock from other Circuitry with a Clock Tree

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details
TBD: The Pb-Free/Green conversion plan has not been defined
Pb -Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb -Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.
TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in Tl's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.
TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.
Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.
In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, Tl's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.
No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.
Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

[^0]:    今
    Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of
    Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

[^1]:    (1) All voltages are measured with respect to $G N D=A G N D=D R G N D=0 V$, unless otherwise specified.
    (2) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is specified to be functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions. Operation of the device beyond the maximum Operating Ratings is not recommended.
    (3) Typical figures are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ and represent most likely parametric norms at the time of product characterization. The typical specifications are not ensured.
    (4) This parameter is specified in units of dBFS - indicating the value that would be attained with a full-scale input signal.

[^2]:    - Changed layout of National Data Sheet to TI format19
