

LM48824 Boomer® Audio Power Amplifier Series Class G Headphone Amplifier with I²C Volume Control

Check for Samples: [LM48824](#)

FEATURES

- Class G Power Savings
- Ground Referenced Headphone Outputs – Eliminates Output Coupling Capacitors
- Common-Mode Sense
- I²C Volume and Mode Control
- High Output Impedance in Shutdown
- Differential Inputs
- Advanced Click-and-Pop Suppression
- Low Supply Current
- Low THD Mode Option

APPLICATIONS

- Mobile Phones, PDAs, MP3 Players
- Portable Electronic Devices, Notebook PCs

KEY SPECIFICATIONS

- Quiescent Power Supply Current at 3.6V: 0.9mA (typ)
- Output Power/Channel at $V_{DD} = 3.6V$ ($R_L = 16\Omega$, $THD+N \leq 1\%$): 37 mW (Typ)
- Output Power/Channel at $V_{DD} = 3.6V$ ($R_L = 32\Omega$, $THD+N \leq 1\%$): 29 mW (Typ)
- PSRR at 217Hz: 100 dB (Typ)
- Shutdown Current: 2.5 μ A (Typ)

Simplified Block Diagram

DESCRIPTION

The LM48824 is a Class G, ground-referenced stereo headphone amplifier designed for portable devices. The LM48824 features TI's ground-referenced architecture, which eliminates the large DC blocking capacitors required by traditional headphone amplifiers, saving board space and minimizing system cost.

The LM48824 takes advantage of TI's patent-pending Class G architecture offering power savings compared to a traditional Class AB headphone amplifier. Additionally, output noise is improved by common-mode sensing that corrects for any differences between the amplifier ground and the potential at the headphone return terminal, minimizing noise created by any ground mismatches.

A high output impedance mode allows the LM48824's outputs to be driven by an external source without degrading the signal. Other features include flexible power supply requirements, differential inputs for improved noise rejection, a low power (2.5 μ A) shutdown mode, and a 32-step I²C volume control with mute function.

The LM48824's superior click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM48824 is available in an ultra-small 16-bump, 0.4mm pitch DSBGA package (1.69mm x 1.69mm)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.
- (2) The Electrical Characteristics tables list specified specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not ensured.
- (3) Soldering Information: See [AN-1112](#) "Micro SMD Wafer Level Chip Scale package"
- (4) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (5) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation is P_{DMAX} = (T_{JMAX} - T_A) / θ_{JA} or the number given in Absolute Maximum Ratings, whichever is lower.
- (6) Human body model, applicable std. JESD22-A114C.
- (7) Machine model, applicable std. JESD22-A115-A.
- (8) Charged Device Model, applicable std. JESD22-C101-C.

Operating Ratings

Temperature Range ($T_{MIN} \leq T_A \leq T_{MAX}$)	$-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$
Supply Voltage (V_{DD})	$2.4\text{V} \leq V_{DD} \leq 5.5\text{V}$

Electrical Characteristics $V_{DD} = 3.6\text{V}^{(1)(2)}$

The following specifications apply for $A_V = 0\text{dB}$, $R_L = 32\Omega$, $f = 1\text{kHz}$, unless otherwise specified. Limits apply to $T_A = 25^{\circ}\text{C}$.

Parameter		Test Conditions	LM48824		Units (Limits)
			Typ ⁽³⁾	Limit ⁽⁴⁾	
I_{DD}	Quiescent Power Supply Current	$V_{IN} = 0\text{V}$, both channels active, $R_L = \infty$	0.9	1.3	mA (max)
		$R_L = \infty$, Low THD mode	1.55		mA
$I_{DD(OP)}$	Operating Power Supply Current	$P_O = 100\mu\text{W}$, two channels in phase, 3dB Crest Factor, $R_L = 32\Omega + 15\Omega$	1.8	2.5	mA (max)
		$P_O = 100\mu\text{W}$, two channels in phase, 3dB Crest Factor, $R_L = 32\Omega + 15\Omega$, Low THD mode	2.2		mA
		$P_O = 500\mu\text{W}$, two channels in phase, 3dB Crest Factor $R_L = 32\Omega + 15\Omega$	3.1	3.8	mA (max)
		$P_O = 500\mu\text{W}$, two channels in phase, 3dB Crest Factor $R_L = 32\Omega + 15\Omega$, Low THD mode	3.4		mA
		$P_O = 1\text{mW}$, two channels in phase, 3dB Crest Factor, $R_L = 32\Omega + 15\Omega$	4.1	4.9	mA (max)
		$P_O = 1\text{mW}$, two channels in phase, 3dB Crest Factor, $R_L = 32\Omega + 15\Omega$, Low THD mode	4.4		mA
I_{SD}	Shutdown Current	Shutdown Enabled, $V_{SCL} = V_{SDA} = 1.8\text{V}$	2.5	3.9	μA (max)
V_{OS}	Output Offset Voltage	$V_{IN} = 0\text{V}$	0.15	0.65	mV (max)
T_{WU}	Wake Up Time	From Shutdown	2		ms
A_V	Gain	Minimum Gain Setting	-59	-58 -60	dB (max) dB (min)
		Maximum Gain Setting	4	4.5 3.5	dB (max) dB (min)
$A_{V(MUTE)}$	Mute Attenuation		-110		dB
R_{IN}	Input Resistance	$A_V = 4\text{dB}$	24	20	k Ω (min)
		$A_V = -59\text{dB}$	64	80	k Ω (max)
P_O	Output Power	$f = 1\text{kHz}$, THD+N = 1% Two channels in phase, $R_L = 16\Omega$	37	30	mW (min)
		$f = 1\text{kHz}$, THD+N = 1% Two channels in phase, $R_L = 32\Omega$	29	23	mW (min)
V_O	Output Swing	THD+N = 1%, Two Channels in Phase			
		$R_L = 16\Omega$	0.77	0.7	V_{RMS} (min)
		$R_L = 32\Omega$	0.96	0.86	V_{RMS} (min)
		$R_L = 32\Omega + 15\Omega$	1.05		V_{RMS}
		$R_L = 10\text{k}\Omega$	1.3	1.1	V_{RMS} (min)

APPLICATION INFORMATION

I²C COMPATIBLE INTERFACE

The LM48824 is controlled through an I²C compatible serial interface that consists of a serial data line (SDA) and a serial clock (SCL). The clock line is uni-directional. The data line is bi-directional (open drain). The LM48824 and the master can communicate at clock rates up to 400kHz. Figure 29 shows the I²C interface timing diagram. Data on the SDA line must be stable during the HIGH period of SCL. The LM48824 is a transmit/receive slave-only device, reliant upon the master to generate the SCL signal. Each transmission sequence is framed by a START condition and a STOP condition (Figure 30). Each data word, device address and data, transmitted over the bus is 8 bits long and is always followed by an acknowledge pulse (Figure 31). The LM48824 device address is 1100000.

I²C BUS FORMAT

The I²C bus format is shown in Figure 31. The START signal, the transition of SDA from HIGH to LOW while SCL is HIGH, is generated, alerting all devices on the bus that a device address is being written to the bus.

The 7-bit device address is written to the bus, most significant bit (MSB) first, followed by the $\overline{R/W}$ bit ($\overline{R/W} = 0$ indicates the master is writing to the LM48824, $\overline{R/W} = 1$ indicates the master wants to read data from the LM48824). Data is latched into the device on the rising clock edge. Each address bit must be stable while SCL is HIGH. After the last address bit is transmitted, the master device releases SDA, during which time, an acknowledge clock pulse is generated by the slave device. If the LM48824 receives the correct address, the device pulls the SDA line low, generating an acknowledge bit (ACK).

Once the master device registers the ACK bit, the 8-bit register address word is sent. Each data bit should be stable while SCL is HIGH. After the 8-bit register address is sent, the LM48824 sends another ACK bit. Following the acknowledgment of the register address, the 8-bit register data word is sent. Each data bit should be stable while SCL is HIGH. After the 8-bit register data is sent, the LM48824 sends another ACK bit. Following the acknowledgment of the register data word, the master issues a STOP bit, allowing SDA to go high while SCL is high.

GENERAL DEVICE FUNCTION

The LM48824 integrates a high efficiency step down (buck) DC-DC switching regulator with a ground reference headphone amplifier. The switching regulator delivers a constant voltage from an input voltage ranging from 2.4V to 5.5V. The switching regulator uses a voltage-mode architecture with synchronous rectification, improving efficiency and reducing component count.

The LM48824 headphone amplifier features TI's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional single-ended headphone amplifiers. A low-noise inverting charge pump creates a negative supply (HPV_{SS}) from the positive supply voltage (V_{DD}). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND. Because there is no DC component on the output signals, the large DC-blocking, AC coupling capacitors (typically 220µF) are not necessary, conserving board space, reducing system cost, and improving frequency response.

CLASS G OPERATION

Class G is a modification of some other class of amplifier (normally Class B or Class AB) to increase efficiency and reduce power dissipation. Class G works off the fact that musical and voice signals have a high peak to mean ratio with most of the signal content at low levels. To decrease power dissipation, Class G has multiple voltage supplies. The LM48824 has two discrete voltage supplies at the output of the buck, 1.1V and 1.8V. When the output reached the threshold to switch to the higher voltage rails, the rails will switch from 1.1V to 1.8V. When the output falls below the required voltage rails for a set period of time, it will switch back to the lower rail until the next time the threshold is reached. Power dissipation is greatly reduced for typical musical or voice sources. The drawing below shows how a musical output may look. The green lines are the supply voltages at the output of the buck converter.

Figure 33. Class G Operation

DIFFERENTIAL AMPLIFIER EXPLANATION

The LM48824 features a differential input stage, which offers improved noise rejection compared to a single-ended input amplifier. Because a differential input amplifier amplifies the difference between the two input signals, any component common to both signals is cancelled.

SYNCHRONOUS RECTIFIER

The buck converter in the LM48824 uses an internal NFET synchronous rectifier to reduce rectifier forward voltage drop and associated power loss. Synchronous rectification provides a significant improvement in efficiency whenever the output voltage is relative low compared to the voltage drop across an ordinary rectifier diode and eliminating the need for the diode.

CURRENT LIMITING

A current limit of the buck converter in the LM48824 allows the device to protect itself and external components during overload conditions.

PFM OPERATION

During PFM(Pulse-Frequency Modulation) operation, if the output voltage of the buck converter is below the 'high' PFM comparator threshold, the PMOS power switch is turned on. It remains on until the output voltage reaches the 'high' PFM threshold or the peak current exceeds the I_{PFM} level set for PFM mode. The typical peak current in PFM mode is $I_{PFM} = 112\text{mA} + V_{DD}/27\Omega$.

Once the PMOS power switch is turned off, the NMOS power switch is turned on until the inductor current ramps to zero. When the NMOS zero-current condition is detected, the NMOS power switch is turned off. If the output voltage is below the 'high' PFM comparator threshold, the PMOS switch is again turned on and the cycle is repeated until the output reaches the desired level. Once the output reaches the 'high' PFM threshold, the NMOS switch is turned on briefly to ramp the inductor current to zero and then both output switches are turned off and the part enters an extremely low power mode.

Figure 34. PFM Operation

SOFT START

The buck converter has a soft-start circuit that limits in-rush current during start-up. During start-up the switch current limit is increased in steps. Soft start is activated only if global SHDN goes from 1 to 0 after V_{DD} reaches 2.7V. Soft start is implemented by increasing switch current limit in steps of 70mA, 140mA, 280mA, and 750mA (typical switch current limit). The start-up time thereby depends on the output capacitor and load current of the buck converter. Typical start-up times with a 10 μ F output capacitor and 150mA load is 280 μ s and with 5mA load is 240 μ s.

COMMON-MODE SENSE

The LM48824 features a ground (common mode) sensing feature. In noisy applications, or where the headphone jack is used as a line out to other devices, noise pick up and ground imbalance can degrade audio quality. The LM48824 COM input senses and corrects any noise at the headphone return, or any ground imbalance between the headphone return and device ground, improving audio reproduction. Connect COM directly to the headphone return terminal of the headphone jack (Figure 35). No additional external components are required. Connect COM to GND if the common-mode sense feature is not in use.

Figure 35. COM Connection

SHUTDOWN FUNCTION

The LM48824 features individual amplifier shutdown control and a global device shutdown control.

Bit B0 (SHDN) of the MODE CONTROL register controls the global shutdown for the entire device. Set SHDN = 1 to put the device into current-saving shutdown mode, and set SHDN = 0 for normal operation. SHDN defaults to 1 at power-up.

Bit B7 (HPL_EN) and Bit B6 (HPR_EN) of the MODE CONTROL register (register address 0x01h) controls the left and right headphone amplifier shutdown respectively. Set HPL_EN = 0 to set the left channel headphone amplifier to shutdown and set HPL_EN = 1 to enable left channel operation. Set HPR_EN = 0 to set the right channel headphone amplifier to shutdown and set HPR_EN = 1 to enable right channel operation. The left and right channel amplifier shutdowns operate individually.

The LM48824 has a shutdown time of 3ms to complete the internal shutdown sequence. After SHDN is set to 1, any new I²C commands should only be sent after the 3ms shutdown time to ensure proper operation of the device.

MUTE FUNCTION

The LM48824 features independent left and right channel mute functions.

Bit B7 (MUTE_L) and Bit B6 (MUTE_R) of the VOLUME CONTROL register (register address 0x02h) controls the mute function of the left and right channels respectively. Set MUTE_L = 1 to mute the left channel and set the MUTE_R = 1 to mute the right channel. Set MUTE_L = 0 and MUTE_R = 0 to disable mute on the respective channels. MUTE_L and MUTE_R defaults to 1 at power-up.

LOW THD+N MODE

The LM48824 features a Low THD mode that reduces THD+N to improve audio quality. Set B3 (Low_THD) of the OUTPUT CONTROL register (register address 0x03h) to 1 to enable the Low THD mode. There is a quiescent and operating current increase in Low THD mode. See [Electrical Characteristics](#) and [Typical Performance Characteristics](#) for reference.

PROPER SELECTION OF EXTERNAL COMPONENTS

INDUCTOR SELECTION

There are two main considerations when choosing an inductor; the inductor saturation current and the inductor current ripple should be small enough to achieve the desired output voltage ripple. Different saturation current rating specifications are followed by different manufacturers so attention must be given to details. Saturation current ratings are typically specified at 25°C, ratings at the maximum ambient temperature of application should be requested from the manufacturer. Shielded capacitors are preferred since these capacitors radiate less noise. Inductors with low DCR should also be considered to minimize the efficiency.

Inductor value involves trade-offs in performance. Larger inductors reduce inductor triple current, which typically means less output voltage ripple (for a given size of output capacitor).

REGULATOR INPUT CAPACITOR SELECTION (C3)

A ceramic input capacitor of 1µF, 6.3V is sufficient for most applications. Place the input capacitor as close as possible to the V_{DD} pin of the device. A larger value may be used for improved input voltage filtering. Use X7R or X5R types; do not use Y5V. DC bias characteristics of ceramic capacitors must be considered when selecting case sizes like 0805 and 0603.

REGULATOR OUTPUT CAPACITOR SELECTION (C4)

A low ESR ceramic output capacitor of 10µF, 6.3V is sufficient for most applications. Use X7R or X5R types; do not use Y5V. DC bias characteristics of ceramic capacitors must be considered when selecting case sizes like 0805 and 0603. DC bias characteristics vary from manufacturer to manufacturer and dc bias curves should be requested from them as part of the capacitor selection process.

CHARGE PUMP CAPACITOR SELECTION

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

CHARGE PUMP FLYING CAPACITOR (C1)

The flying capacitor (C1) affects the load regulation and output impedance of the charge pump. A C1 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C1 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2µF, the R_{DS(ON)} of the charge pump switches and the ESR of C1 and C2 dominate the output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

CHARGE PUMP HOLD CAPACITOR (C2)

The value and ESR of the hold capacitor (C2) directly affects the ripple on CPV_{SS}. Increasing the value of C2 reduces output ripple. Decreasing the ESR of C2 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems with low maximum output power requirements.

Amplifier Input Capacitor Selection

Input capacitors may be required for some applications, or when the audio source is single-ended. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM48824. The input capacitors create a high-pass filter with the input resistors R_{IN}. The -3dB point of the high-pass filter is found using the equation below.

$$f = 1 / 2\pi R_{IN} C_{IN} \quad (\text{Hz}) \quad (1)$$

Where the value of R_{IN} is given in the [Electrical Characteristics VDD = 3.6V](#).

High-pass filtering the audio signal can be beneficial for some applications. When the LM48824 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

SINGLE-ENDED AUDIO AMPLIFIER CONFIGURATION

The LM48824 is compatible with single-ended sources. Figure 36 shows the typical single-ended applications circuit. Input coupling capacitors are required for single-ended configuration.

Revision History

Rev	Date	Description
1.0	08/06/09	Initial released of the full datasheet.
1.01	08/31/09	Text edits.
D	05/02/2013	Changed layout of National Data Sheet to TI format.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LM48824TM/NOPB	ACTIVE	DSBGA	YFQ	16	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GL6	Samples
LM48824TMX/NOPB	ACTIVE	DSBGA	YFQ	16	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GL6	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
