LM48512 Boomer® Audio Power Amplifier Series PowerWise® Boosted, Ultra Low-EMI, Mono, E²S Class D Audio Power Amplifier

Check for Samples: LM48512

FEATURES

- **E²S System Reduces EMI while Preserving Audio Quality and Efficiency**
- **Integrated Boost Converter**
- **Supply Voltage Level Detection on Boost Converter**
- **Low Power Shutdown Mode**
- **"Click and Pop" suppression**

APPLICATIONS

- **Mobile phones**
- **Smart phones**
- **PDAs**

DESCRIPTION

Part of National's PowerWise family or products, the LM48512 delivers 1.8W into 8Ω, while consuming 14.5mA of quiescent current. The LM48512 also features National's Enhanced Emissions Suppression (E²S) system, a patented, ultra low EMI PWM architecture that significantly reduces RF emissions while preserving audio quality and efficiency. LM48512 improves battery life, reduces external component count, board area consumption, system cost, and simplifies design.

The LM48512 is designed to meet the demands of portable multimedia devices. The LM48512 features high efficiency compared to other boosted amplifiers and low EMI Class D amplifiers. The LM48512 is capable of driving an 8Ω speaker to 5.5V levels (1.8W) from a 3.6V supply while operating at 82% efficiency. Flexible power supply requirements allow operation from 2.3V to 5.5V. The E²S system features a patented edge rate control (ERC) architecture that further reduces emissions by minimizing the high frequency component of the device output, while maintaining high quality audio reproduction (THD+N = 0.03%) and high efficiency. A low power shutdown mode reduces supply current consumption to 0.04µA.

The LM48512 features a battery-saving automatic gain control (AGC). The AGC detects the battery voltage and reduces the gain of the amplifier to limit the output as the battery voltage decreases.

Superior click and pop suppression eliminates audible transients on power-up/down and during shutdown.

Table 1. Key Specifications

	VALUE	UNIT
■ Power Output at V_{DD} = 3.6V R_L = 8Ω, THD+N ≤ 1%	1.8	W (typ)
■ Efficiency at 3.6V, 800mW into 8Ω	82% (typ)	
■ Quiescent Power Supply Current at 3.6V	14.5mA	
■ Shutdown current	0.04µA (typ)

Pin Functions

Pin Descriptions

PIN	NAME	DESCRIPTION
A1	PV_{DD}	Amplifier Power Supply Input. Connect to PVOUT.
A2	PVOUT	Boost Converter Output
A3	SW	Boost Converter Switching Node
A4	PGND	Boost Converter Power Ground
B1	OUTA	Non-Inverting Amplifier Output
B2	GAIN	Gain Select Input
B3	R_{TRIP}	Boost Supply Threshold Voltage Set Pin
B4	V_{DD}	Power Supply
C1	OUTB	Inverting Amplifier Output
C2, D1	PGND	Class D Power Ground
C3	$\overline{SDAMP}$	Active Low Amplifier Shutdown Input. Connect to V_{DD} for normal operation.
C4	GND	Ground
D2	IN+	Non-Inverting Amplifier Input
D3	IN-	Inverting Amplifier Input
D4	$\overline{SDREG}$	Active Low Boost Converter Shutdown Input. Connect to V_{DD} for normal operation.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings [(1)] [(2)]

Supply Voltage (V_{DD}) [(1)]	6.0V
Storage Temperature	−65°C to +150°C

(1) *"Absolute Maximum Ratings"* indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified.

(2) The *Electrical Characteristics* tables list guaranteed specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not guaranteed.

(3) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} − T_A) / \theta_{JA}$ or the number given in *Absolute Maximum Ratings*, whichever is lower.

(4) Human body model, applicable std. JESD22-A114C.

(5) Machine model, applicable std. JESD22-A115-A.

Application Information

GENERAL AMPLIFIER FUNCTION

The LM48512 mono Class D audio power amplifier features a filterless modulation scheme that reduces external component count, conserving board space and reducing system cost. The outputs of the device transition from V_{DD} to GND with a 300kHz switching frequency. With no signal applied, the outputs (V_{OUTA} and V_{OUTB}) switch with a 50% duty cycle, in phase, causing the two outputs to cancel. This cancellation results in no net voltage across the speaker, thus there is no current to the load in the idle state.

With the input signal applied, the duty cycle (pulse width) of the LM48512 outputs changes. For increasing output voltage, the duty cycle of V_{OUTA} increases, while the duty cycle of V_{OUTB} decreases. For decreasing output voltages, the converse occurs. The difference between the two pulse widths yields the differential output voltage.

ENHANCED EMISSIONS SUPPRESSION SYSTEM (E²S)

The LM48512 features National's patent-pending E²S system that reduces EMI, while maintaining high quality audio reproduction and efficiency. The E²S system features advanced edge rate control (ERC), greatly reducing the high frequency components of the output square waves by controlling the output rise and fall times, slowing the transitions to reduce RF emissions, while maximizing THD+N and efficiency performance. The overall result of the E²S system is a filterless Class D amplifier that passes FCC Class B radiated emissions standards with 20in of twisted pair cable, with excellent 0.03% THD+N and high 82% efficiency.

DIFFERENTIAL AMPLIFIER EXPLANATION

As logic supplies continue to shrink, system designers are increasingly turning to differential analog signal handling to preserve signal to noise ratios with restricted supply level. The LM48512 features a fully differential speaker amplifier. A differential amplifier amplifies the difference between the two input signals. Traditional audio power amplifiers have typically offered only single-ended inputs resulting in a 6dB reduction of SNR relative to differential inputs. The LM48512 also offers the possibility of DC input coupling which eliminates the input coupling capacitors. A major benefit of the fully differential amplifier is the improved common mode rejection ratio (CMRR) over single ended input amplifiers. The increased CMRR of the differential amplifier reduces sensitivity to ground offset related noise injection, especially important in noisy systems.

When evaluating the LM48512, use BAL-GND inputs and provide clean grounding to ensure proper operation.

SYNCHRONOUS RECTIFIER

The LM48512 uses an internal synchronous series switch in place of an external Schottcky diode, which reduces the number of external components required for its application. Efficiency is also increased since the power dissipation of the switch is less than the power dissipation of a diode.

BOOST INPUT CAPACITOR SELECTION

An input capacitor is required to serve as an energy reservoir for the current which must flow into the coil each time the switch turns ON. The input capacitor will also help keep the noise low from the power supply. This capacitor must have extremely low ESR, so ceramic capacitors are recommended. A nominal value of 10µF is recommended for this application.

MAXIMUM CURRENT

The boost converter of the LM48512 has two maximum current limits to prevent damage to the device and also battery shutdown when the current gets too high. First is the control of the start-up current, where the boost converter internally limits it to 600mA ($I_{LIMIT(SU)}$). The second limit is on the inductor current, where it is typically internally limited to 2.25A.

AUTOMATIC GAIN CONTROL AND AUTOMATIC LEVEL CONTROL

The LM48512 features either Automatic Gain Control (AGC) or Automatic Level Control (ALC) by configuring the R_{TRIP} pin B3. The settings are shown in Table 2.

Table 2. Automatic Gain/Level Control Table

R_{TRIP}	Operation
V_{DD}	Disable AGC and ALC
Resistor	AGC
GND	ALC

Automatic Gain Control Operation

The AGC circuitry is designed to limit the output swing to the load for speaker protection and to prolong battery life. When R_{TRIP} is connected to a resistor, AGC activates by detecting the V_{DD} level in combination with the input level. The user can set the V_{DD} level ($V_{DD(TRIP)}$) at which AGC trips by connecting different resistor values (R_{TRIP}) to ground, refer to Table 3.

Table 3. AGC Table

R_{TRIP} (kΩ)	$V_{DD(TRIP)}$ (V)
20.0	3.7
24.8	3.6
27.5	3.55
30.3	3.5
36.3	3.4
42.8	3.3
49.7	3.2
57.1	3.1
64.9	3.0
73.2	2.9
82.0	2.8

Once V_{DD} drops below the $V_{DD(TRIP)}$ voltage set by R_{TRIP}, AGC operation begins. While AGC is in operation, V_{DD} sets the output swing as shown in Figure 4.

Figure 4. AGC Output Swing vs Supply Voltage Graph

If output swing of the amplifier exceeds the limit determined by V_{DD}, gain of the amplifier will be adjusted accordingly.

See Figure 5 for the following:

Attack: AGC attack occurs at increments of -1dB steps every 20µs until the output is below the output swing limit or when it reaches the maximum gain compression of -6dB.

Release: AGC releases at increments of 0.5dB steps per every 800ms if the output does not reach the output swing limit.

Adjusting: While the part is in compression mode, the first attack following a release is at increments of 0.5dB steps, this is also referred to as Adjusting.

Figure 5. AGC Operation

*Automatic Level Control*

The ALC circuitry is similar to AGC in that it also limits the output swing of the amplifier, but the difference is that ALC is always activated once the R_{TRIP} pin is connected to GND. The output limit swing of the amplifier will be limited to 90% of PVOUT, with the same Attack, Release, and Adjusting characteristics as the AGC.

Product Folder Links: *LM48512*

POWER DISSIPATION AND EFFICIENCY

The major benefit of a Class D amplifier is increased efficiency versus a Class AB. The efficiency of the LM48512 is attributed to the region of operation of the transistors in the output stage. The Class D output stage acts as current steering switches, consuming negligible amounts of power compared to their Class AB counterparts. Most of the power loss associated with the output stage is due to the IR loss of the MOSFET on-resistance, along with switching losses due to gate charge.

SHUTDOWN FUNCTION

The LM48512 features a low current shutdown mode. Set $\overline{SDREG}$ = $\overline{SDAMP}$ = GND to disable the amplifier and reduce supply current to 0.04µA.

Switch $\overline{SDREG}$ and $\overline{SDAMP}$ between GND and V_{DD} for minimum current consumption is shutdown. The LM48512 may be disabled with shutdown voltages in between GND and V_{DD}, the idle current will be greater than the typical 0.1µA value. Increased THD+N may also be observed when a voltage of less than V_{DD} is applied to SDREG and SDAMP.

PROPER SELECTION OF EXTERNAL COMPONENTS

Inductor Selection

The LM48512 is designed to use a 2.2µH inductor. When the boost converter is boosting, the inductor will typically be the biggest area of efficiency loss in the boost converter circuitry, therefore, choosing an inductor with the lowest possible series resistance is important. In addition to the series resistance, the saturation rating of the inductor should also be greater than the maximum operating peak current.

Boost Output Capacitor Selection

The boost converter in the LM48512 is designed to operate with a 22µF ceramic output capacitor. When the boost converter is running, the output capacitor supplies the load current during the boost converter on-time. When the NMOS switch turns off, the inductor energy is discharged through the internal PMOS switch, supplying power to the load and restoring charge to the output capacitor. This causes a sag in the output voltage (PVOUT) during the on-time and a rise in the output voltage during the off-time. The output capacitor is chosen to limit this output ripple and to ensure the converter remains stable.

AUDIO AMPLIFIER POWER SUPPLY BYPASSING/FILTERING

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the device as possible. A 10µF and a 1µF bypass capacitors are recommended to increase supply stability.

AUDIO AMPLIFIER INPUT CAPACITOR SELECTION

Input capacitors may be required for some applications, or when the audio source is single-ended. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM48512. The input capacitors create a high-pass filter with the input resistors R_{IN}. The -3dB point of the high pass filter is found using Equation 1 below.

$$f = 1 / 2\pi R_{IN}C_{IN} \tag{1}$$

Where R_{IN} is the value of the input resistor given in the *Electrical Characteristics* table.

The input capacitors can also be used to remove low frequency content from the audio signal. Small speakers cannot reproduce, and may even be damaged by low frequencies. High pass filtering the audio signal helps protect the speakers. When the LM48512 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies (for example, 217Hz in a GSM phone), filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

AUDIO AMPLIFIER GAIN

The LM48512 features three logic configured gain settings. The device gain is selected through the GAIN input. The gain settings are as shown in Table 4.

Table 4. Gain Settings

GAIN pin input	A_V
GND (<0.7V)	6dB
Float (0.7V–1.0V)	15.5dB
V_{DD} (>1.0V)	20dB

SINGLE-ENDED AUDIO AMPLIFIER CONFIGURATION

The LM48512 is compatible with single-ended sources. When configured for single-ended inputs, input capacitors must be used to block and DC component at the input of the device. One thing to note is that the Differential AC Input specification of $5.6V_{P-P}$ (max) will be $2.8V_{P-P}$ in the Single-Ended application. Figure 6 shows the typical single-ended applications circuit.

Figure 6. Single-Ended Input Configuration

PCB LAYOUT GUIDELINES

As output power increases, interconnect resistance (PCB traces and wires) between the amplifier, load and power supply create a voltage drop. The voltage loss due to the traces between the LM48512 and the load results in lower output power and decreased efficiency. Higher trace resistance between the supply and the LM48512 has the same effect as a poorly regulated supply, increasing ripple on the supply line, and reducing peak output power. The effects of residual trace resistance increases as output current increases due to higher output power, decreased load impedance or both. To maintain the highest output voltage swing and corresponding peak output power, the PCB traces that connect the output pins to the load and the supply pins to the power supply should be as wide as possible to minimize trace resistance.

The use of power and ground planes will give the best THD+N performance. In addition to reducing trace resistance, the use of power planes creates parasitic capacitors that help to filter the power supply line.

Product Folder Links: *LM48512*

The inductive nature of the transducer load can also result in overshoot on one of both edges, clamped by the parasitic diodes to GND and V_{DD} in each case. From an EMI standpoint, this is an aggressive waveform that can radiate or conduct to other components in the system and cause interference. In is essential to keep the power and output traces short and well shielded if possible. Use of ground planes beads and micros-strip layout techniques are all useful in preventing unwanted interference.

As the distance from the LM48512 and the speaker increases, the amount of EMI radiation increases due to the output wires or traces acting as antennas become more efficient with length. Ferrite chip inductors places close to the LM48512 outputs may be needed to reduce EMI radiation.

LM48512 Demo Board Schematic
*R_{LIMIT} on demoboard is equilvalent to R_{TRIP} resistor in datasheet.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LM48512TL/NOPB	ACTIVE	DSBGA	YZR	16	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GN3	Samples
LM48512TLX/NOPB	ACTIVE	DSBGA	YZR	16	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	GN3	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
