## Functional Description

The 'ACT825 consists of eight D-type edge-triggered flip-flops. These devices have TRI-STATE® outputs for bus systems, organized in a broadside pinning. In addition to the clock and output enable pins, the buffered clock (CP) and buffered Output Enable ( $\overline{OE}$ ) are common to all flip-flops. The flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH CP transition. With  $\overline{OE}_1$ ,  $\overline{OE}_2$  and  $\overline{OE}_3$  LOW, the contents of the flip-flops are available at the outputs. When one of  $\overline{OE}_1$ ,  $\overline{OE}_2$  or  $\overline{OE}_3$  is HIGH, the outputs go to the high impedance state.

Operation of the  $\overline{OE}$  input does not affect the state of the flip-flops. The 'ACT825 has Clear ( $\overline{CLR}$ ) and Clock Enable ( $\overline{EN}$ ) pins. These pins are ideal for parity bus interfacing in high performance systems.

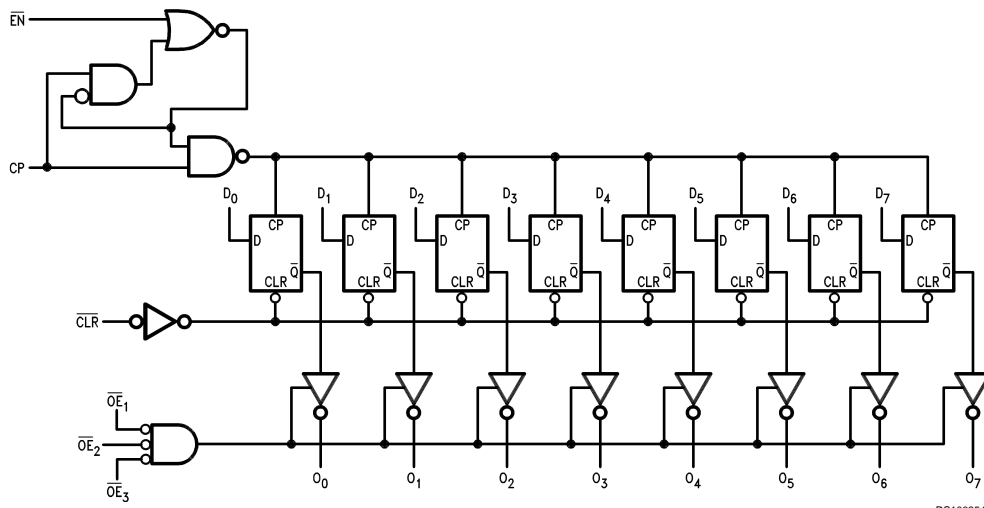

When  $\overline{CLR}$  is LOW and  $\overline{OE}$  is LOW, the outputs are LOW. When  $\overline{CLR}$  is HIGH, data can be entered into the flip-flops. When  $\overline{EN}$  is LOW, data on the inputs is transferred to the outputs on the LOW-to-HIGH clock transition. When  $\overline{EN}$  is HIGH, the outputs do not change state, regardless of the data or clock input transitions.
