CLC436 100 MHz, Plus/Minus-15V, Low Power, Voltage Feedback Op Amp

Literature Number: SNOS825

Comlinear CLC436 200MHz, ±15V, Low-Power Voltage Feedback Op Amp

General Description

The Comlinear CLC436 is a high-performance, low power, voltage-feedback operational amplifier that has been designed for a wide range of low-cost applications. The CLC436 is specified to operate from dual ±5V to dual ±15V power supplies. Operating from ±5V supplies, the unity gain stable CLC436 consumes a mere 23mW of power and features a 150MHz bandwidth and 850V/μs slew rate. Operating from ±15V power supplies, the CLC436 consumes only 69mW ($I_{CC} = 2.3\text{mA}$) to provide a 200MHz unity-gain bandwidth, a very fast 2400V/μs slew rate and 13ns rise/fall times (5V step). At ±15V, the device also provides large signal swings (>20V_{pp}) to give high dynamic range and signal-to-noise ratio.

As a low-power NTSC or PAL video line-driver, the CLC436 delivers low differential gain and phase errors (0.2%, 1.2°) and very high output drive current of 80mA. When used as a video ADC driver, the CLC436 offers low Total Harmonic Distortion (THD) and high Spurious Free Dynamic Range (SFDR). Because of its voltage feedback topology, the CLC436 allows use of reactive elements in the feedback path and can be configured as an excellent active filter for video-reconstruction DACs.

The CLC436's combination of low cost and high performance in addition to its low-power voltage-feedback topology make it a versatile signal conditioning building block for a wide range of price-sensitive applications.

Features

- 2.3mA supply current
- 200MHz unity-gain bandwidth
- 2400V/μs slew rate
- Unity gain stable
- 110dB common-mode rejection ratio
- 80mA drive current
- >20V_{pp} output swing
- ±5V to ±15V supplies

Applications

- Video line driver
- Video ADC driver
- Desktop Multimedia
- Low powered cable driver
- Video DAC buffer
- Active filters/integrators
- NTSC & PAL video systems

Frequency Response ($A_v = +2V/V$)

Typical Application
State-Variable Filter (1MHz, Q = 5, G = 2)

Bandpass Output

Pinout DIP & SOIC

CLC436 Electrical Characteristics ($V_{CC} = \pm 15V$, $A_V = +2$, $R_f = 499\Omega$, $R_L = 1k\Omega$; unless specified)

CLC436 OPERATION

Description

The CLC436 is a unity gain stable voltage feedback amplifier. The voltage feedback topology allows for capacitors and nonlinear devices in the feedback path. The matched input bias currents track well over temperature. This allows the DC offset to be minimized by matching the impedance seen by both inputs.

The low cost, low power, conventional topology, and high output current make the CLC436 an excellent choice for applications such as:

- Low Power Cable Drivers
- Active Filters
- Buffers
- NTSC and PAL Video Systems

Gain

The non-inverting and inverting gain equations for the CLC436 are as follows:

$$\text{Non-inverting Gain: } 1 + \frac{R_f}{R_g}$$

$$\text{Inverting Gain: } -\frac{R_f}{R_g}$$

Where R_f is the feedback resistor and R_g is the gain setting resistor. Figure 1 shows the general non-inverting gain configuration including the recommended bypass capacitors.

Figure 1: Recommended Non-Inverting Gain Circuit

Output Drive Performance

The CLC436 can source over 120mA of output current. It can easily drive 9V_{pp} into a 50 Ω load. The circuit shown in Figure 1 demonstrates the output current capability of the CLC436. The circuit values listed below, a 3V_{pp} input signal and $\pm 15V$ supplies, were used to obtain the result shown in Figure 2.

- $R_f = 499\Omega$
- $R_L = 50\Omega$
- $R_g = 249.5\Omega$
- $R_{in} = 50\Omega$

Figure 2: Large Signal Pulse Response into 50

The high output drive capability of the CLC436 is suitable for driving capacitive loads. When driving a capacitive load or coaxial cable, include a series resistance R_s to improve stability. Refer to the **R_s vs Capacitive Load** plot in the typical performance section to determine the recommended resistance for various capacitive loads.

Single Supply Operation

The CLC436 can be operated from a single supply using the topology shown in Figure 3. R_1 and R_2 form a voltage divider that sets the non-inverting input DC voltage. The coupling capacitor C_1 isolates the DC bias point from the previous stage. The DC gain of this circuit is 1 and the high frequency gain is set by R_f and R_g .

Figure 3: Single Supply Circuit

Power Dissipation

The power dissipation of an amplifier can be described in two conditions:

- Quiescent Power Dissipation - P_Q
(No Load Condition)
- Total Power Dissipation - P_T
(with Load Condition)

The following steps can be taken to determine the power consumption of the CLC436:

1. Determine the quiescent power
 $P_Q = I_{CC} (V_{CC} - V_{EE})$
2. Determine the RMS power at the output stage
 $P_O = (V_{CC} - V_{load}) (I_{load})$
3. Determine the total RMS power
 $P_T = P_Q + P_O$

The maximum power that the package can dissipate at a given temperature is illustrated in the **Power Derating** plot in the **Typical Performance Characteristics** section. The power derating curve for any package can be derived by utilizing the following equation:

$$P = \frac{(175^\circ - T_{amb})}{\theta_{JA}}$$

where: T_{amb} = Ambient temperature in $^\circ C$
 θ_{JA} = Thermal resistance, from junction to ambient, for a given package in $^\circ C/W$

Layout Considerations

A proper printed circuit layout is essential for achieving high frequency performance. Comlinear provides evaluation boards for the CLC436 (730013 - DIP, 730027-SOIC) and suggests their use as a guide for high frequency layout and as an aid for device testing and characterization.

Supply bypassing is required for optimum performance. The bypass capacitors provide a low impedance current return path at the supply pins. They also provide high frequency filtering on the power supply traces. Other layout factors also play a major role in high frequency performance. The following steps are recommended as a basis for high frequency layout:

1. Include 6.8 μF tantalum and 0.01 μF ceramic bypass capacitors on both supplies.
2. Place the 6.8 μF capacitors within 0.75 inches of the power pins.
3. Place the 0.01 μF capacitors within 0.1 inches of the power pins.
4. Remove the ground plane near the input and output pins to reduce parasitic capacitance.
5. Minimize all trace lengths to reduce series inductances.

Applications Circuit

State Variable Filter

The filter shown on the front page offers both a band-pass and a low pass output. The design equations are shown below.

$$Q = \frac{R_1}{R_3}$$

$$A_v = \frac{R_1}{R_4}, \text{ desired mid-band gain}$$

$$f_r = \frac{Q}{2\pi R_1 C}, \text{ desired resonant frequency}$$

$$R_2 = R_3$$

The state variable filter can be modified to obtain a tunable band pass filter. This technique is shown in the CLC522, Wideband Variable Gain Amplifier, data sheet.

Transimpedance Application

The low 1.1pA/ \sqrt{Hz} input current noise and unity gain stability make the CLC436 useful as a photo diode pre-amplifier. Figure 4 illustrates a transimpedance amplifier. R_f sets the transimpedance gain. The photodiode current is multiplied by R_f to determine the output voltage.

Figure 4: Transimpedance Amplifier

The feedback capacitor (C_f) is required to compensate for the added input capacitance of the photodiode (C_d). The feedback capacitance reduces peaking in the frequency response. As the value of the feedback capacitance increases from zero, the rolloff of the response will increase.

Instrumentation Amplifier

An instrumentation circuit is shown in Figure 5. The high CMRR of the CLC436 benefits this application. The resistors are kept equal to improve the overall CMRR.

**Figure 5: Instrumentation Amplifier****2nd Order Sallen-Key Band-Pass Filter**

The CLC436 is well suited for Sallen-Key type active filters. Figure 6 illustrates the band pass topology and design equations. For optimum high frequency performance:

- Keep the resistor values between 10Ω and 1kΩ
- Keep the capacitor values between 10pF and 500pF

Begin design by choosing reasonable values for C_1 and C_2 and then setting the desired mid-band gain.

$$C_2 = \frac{1}{5} C_1$$

$$G = 1 + \frac{R_f}{R_g}, \text{ desired mid-band gain}$$

$$R_1 = 2 \frac{Q}{GC_1(2\pi f)}, \text{ where } f = \text{desired center frequency}$$

$$R_2 = \frac{GR_1 \left(\sqrt{1 + 4.8Q^2 - 2G + G^2} + 1 \right)}{4.8Q^2 - 2G + G^2}$$

$$R_3 = \frac{5GR_1 \left(\sqrt{1 + 4.8Q^2 - 2G + G^2} + G - 1 \right)}{4Q^2}$$

Life Support Policy

National's products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of National Semiconductor Corporation. As used herein:

1. Life support devices or systems are devices or systems which, a) are intended for surgical implant into the body, or b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
