

CLC411 High Speed Video Op Amp with Disable

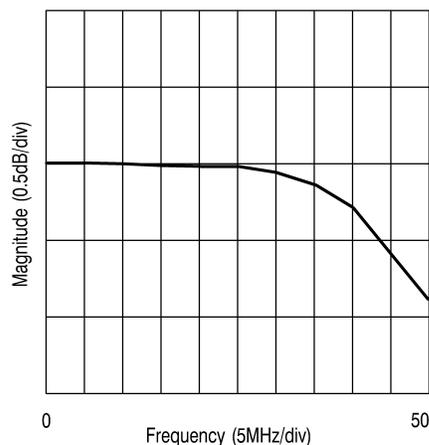

Check for Samples: [CLC411](#)

FEATURES

- 200MHz Small Signal Bandwidth ($1V_{PP}$)
- $\pm 0.05\text{dB}$ Gain Flatness to 30MHz
- 0.02%, 0.03° Differential Gain, Phase
- 2300V/ μs Slew Rate
- 10ns Disable to High Impedance Output
- 70mA Continuous Output Current
- $\pm 4.5\text{V}$ Output Swing into 100 Ω Load
- $\pm 4.0\text{V}$ Input Voltage Range

APPLICATIONS

- HDTV Amplifier
- Video Line Driver
- High Speed Analog Bus Driver
- Video Signal Multiplexer
- DAC Output Buffer

Gain Flatness ($A_V=+2$)

TYPICAL APPLICATION

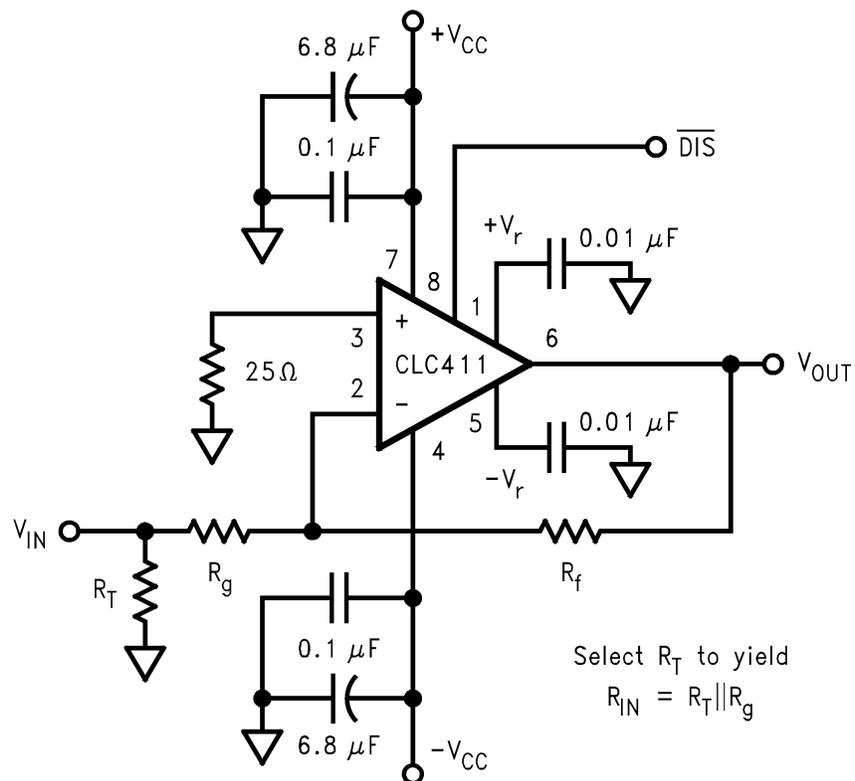

Figure 2. Recommended Inverting Gain Configuration

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾

V_{CC}		± 18 V
I_{OUT}		125 mA
Common-Mode Input Voltage		$\pm V_{CC}$ V
Differential Input Voltage		± 15 V
Maximum Junction temperature		+150 °C
Operating Temperature Range		-40 to +85 °C
Storage Temperature Range		-65 to +150 °C
Lead Temperature	Soldering 10 sec	+300 °C
ESD	Human Body Model	1000 V

- (1) Absolute Maximum Ratings are those values beyond which the safety of the device cannot be ensured. They are not meant to imply that the devices should be operated at these limits. The table of [ELECTRICAL CHARACTERISTICS](#) specifies conditions of device operation.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

OPERATING RATINGS

Thermal Resistance		
Package	(θ_{JC})	(θ_{JA})
SOIC	65°C/W	120°C/W
PDIP	55°C/W	135°C/W

ELECTRICAL CHARACTERISTICS

($A_V = +2$, $V_{CC} = \pm 15V$, $R_L = 100\Omega$, $R_f = 301\Omega$; unless specified).

Symbol	Parameter	Conditions	Typ	Min/Max Ratings ⁽¹⁾			Units

APPLICATION DIVISION

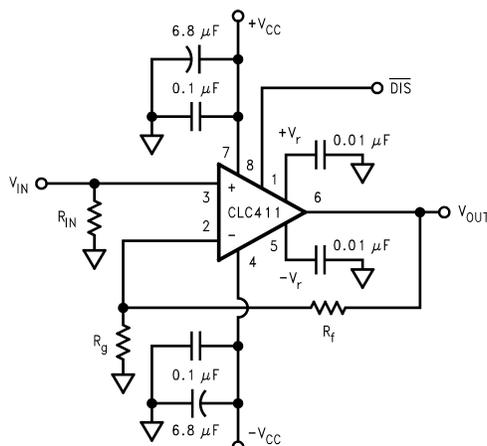

Figure 18. Recommended Non-Inverting Gain Circuit

Description

The CLC411 is a high speed current feedback operational amplifier which operates from $\pm 15\text{V}$ power supplies. The external supplies ($\pm V_{CC}$) are regulated to lower voltages internally. The amplifier itself sees approximately $\pm 6.5\text{V}$ rails. Thus the device yields performance comparable to TI's $\pm 5\text{V}$ devices, but with higher supply voltages. There is no degradation in rated specifications when the CLC411 is operated from $\pm 12\text{V}$. A slight reduction in bandwidth will be observed with $\pm 10\text{V}$ supplies. Operation at less than $\pm 10\text{V}$ is not recommended.

A block diagram of the amplifier and regulator topology is shown in Figure 19, "CLC411 Equivalent Circuit." The regulators derive their reference voltage from an internal floating zener voltage source. External control of the zener reference pins can be used to level shift amplifier operation which is discussed in detail in the section entitled "Extending Input/Output Range with V_r ."

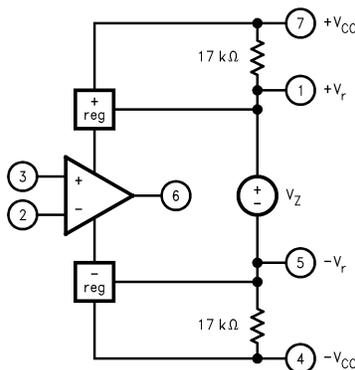

Figure 19. CLC411 Equivalent Circuit

Power Supply Decoupling

There are four pins associated with the power supplies. The V_{CC} pins (4,7) are the external supply voltages. The V_{CC} pins (5,1) are connected to internal reference nodes. Figure 18 and Figure 20 "Recommended Non-inverting Gain Circuit" and "Recommended Inverting Gain Circuit" show the recommended supply decoupling scheme with four ceramic and two electrolytic capacitors. The ceramic capacitors must be placed immediately adjacent to the device pins and connected directly to a good low inductance ground plane. Bypassing the V_r pins will reduce high frequency noise ($>10\text{MHz}$) in the amplifier. If this noise is not a concern these capacitors may be eliminated.

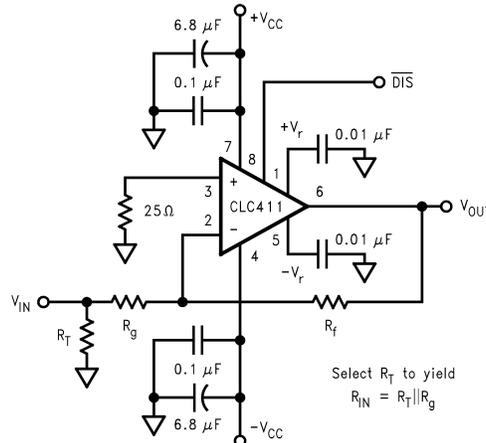

Figure 20. Recommended Inverting Gain Circuit

Differential Gain and Phase

The differential gain and phase errors of the CLC411 driving one doubly-terminated video load ($R_L=150\Omega$) are specified and ensured in the [ELECTRICAL CHARACTERISTICS](#) table. The [TYPICAL PERFORMANCE CHARACTERISTICS](#) plot, Figure 13 "Differential Gain and Phase (4.43MHz)" shows the differential gain and phase performance of the CLC411 when driving from one to four video loads. Application note OA-08, "Differential Gain and Phase for Composite Video Systems," describes in detail the techniques used to measure differential gain and phase.

Feedback Resistor

The loop gain and frequency response for a current feedback operational amplifier is determined largely by the feedback resistor, R_f . The electrical characteristics and typical performance plots contained within the datasheet, unless otherwise stated, specify an R_f of 301Ω , a gain of $+2V/V$ and operation with a $\pm 15V$ power supplies. The frequency response at different gain settings and supply voltages can be optimized by selecting a different value of R_f . Generally, lowering R_f will peak the frequency response and extend the bandwidth while increasing its value will roll off the response.

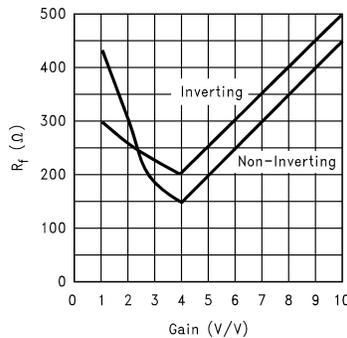

Figure 21. Recommended R_f vs. Gain

For unity gain voltage follower circuits, a non-zero R_f must be used with current feedback operational amplifiers such as the CLC411. Application note OA-13 ([SNOA366](#)), "Current-Feedback Loop-Gain Analysis and Performance Enhancements," explains the ramifications of R_f and how to use it to tailor the desired frequency response with respect to gain. The equations found in the application note should be considered as a starting point for the selection of R_f . The equations do not factor in the effects of parasitic capacitance found on the inverting input, the output nor across the feedback resistor. Equations in OA-13 require values for R (301Ω), $A_v(+2)$ and R_i (inverting input resistance, 50Ω). Combining these values yields a Z_t (optimum feedback transimpedance) of 400Ω . Figure 21 entitled "Recommended R_f vs. Gain" will enable the selection of the feedback resistor that provides a maximally flat frequency response for the CLC411 over its gain range.

The linear portion of the two curves (i.e. $A_V > 4$) results from the limitation on R_G (i.e. $R_G \geq 50\Omega$).

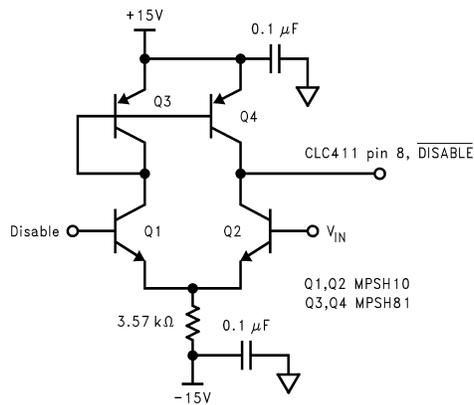

Figure 22. Disable Interface

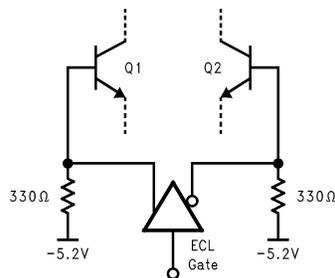

Figure 23. Differential ECL Interface

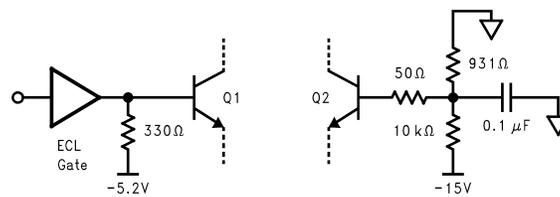

Figure 24. ECL Interface

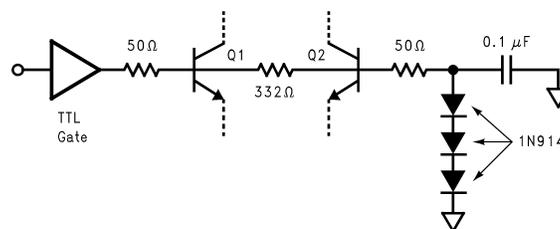

Figure 25. TTL Interface

Enable/Disable Operation

The disable feature allows the outputs of several CLC411 devices to be connected onto a common analog bus forming a high speed analog multiplexer. When disabled, the output and inverting inputs of the CLC411 become high impedances. The disable pin has an internal pull up resistor which is pulled up to an internal voltage, not to an external supply. The CLC411 is enabled when pin 8 is left open or pulled up to $\geq +7V$ and disabled when grounded or pulled below $+3V$. CMOS logic devices are necessary to drive the disable pin. For example, CMOS logic with $V_{DD} \geq +7V$ will ensure proper operation over temperature. TTL voltage levels are inadequate for controlling the disable feature.

For faster enable/disable operation than 15V CMOS logic devices will allow, the circuit of [Figure 22](#) is recommended. A fast four transistor comparator, [Figure 22](#), interfaces between the CLC411 DISABLE pin and several standard logic families. This circuit has a differential input between the bases of Q1 and Q2. As such it may be drive directly from differential ECL logic, as in shown in [Figure 23](#). Single-ended logic families may also be used by establishing an appropriate threshold voltage on the V_{th} input, the base of Q2.

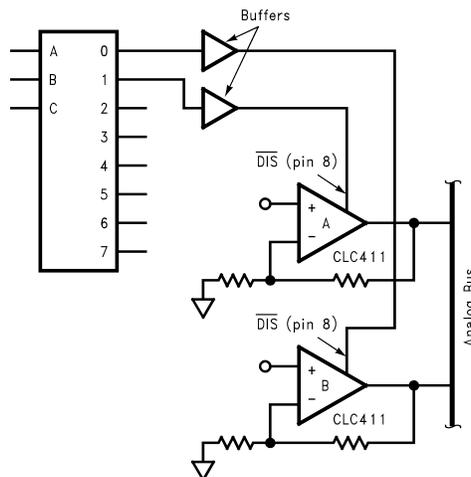

Figure 26. General Multiplexing Circuit

[Figure 24](#) and [Figure 25](#) illustrate a single-enabled ECL and TTL interface respectively. The Disable input, the base of Q1, is driven above and below the threshold, V_{th} .

Fastest switching speeds result when the differential voltage between the bases of Q1 and Q2 is kept to less than one volt. Single-ended ECL, [Figure 24](#), maintains this desired maximum differential input voltage. TTL and CMOS have higher V_{high} to V_{low} excursions. The circuit of [Figure 25](#) will ensure the voltage applied between the bases of Q1 and Q2 does not cause excessive switching delays in the CLC411. Under the above proscribed four transistor interface, all variations were evaluated with approximately 1ns rise and fall times which produced switching speeds equivalent to the rated disable/enable switching times found in the CLC411 [ELECTRICAL CHARACTERISTICS](#) table.

A general multiplexer configuration using several CLC411s is illustrated in [Figure 26](#), where a typical 8-to-1 digital mux is used to control the switching operation of the paralleled CLC411s. Since "break-before-make" is an ensured specification of the CLC411 this configuration works nicely. Notice the buffers used in driving the disable pins of the CLC411s. These buffers may be 15V CMOS logic devices mentioned previously or any variation of the four-transistor comparator illustrated above.

Extending Input/Output Range with V_r

As can be seen in [Figure 20](#), the magnitude of the internal regulated supply voltages is fixed by V_z . In normal operation, with $\pm 15V$ external supplies, $+V_r$ is nominally $+9V$ when left floating. CMIR (common mode input range) and VO (output voltage range, no load) are specified under these conditions. These parameters implicitly have OV as their midpoint, i.e. the VO range is $\pm 6V$, centered at OV.

REVISION HISTORY

Changes from Revision C (April 2013) to Revision D	Page
• Changed layout of National Data Sheet to TI format	12

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
