*CLC5602 Dual, High Output, Video Amplifier*

Literature Number: SNOS905C

# CLC5602

## Dual, High Output, Video Amplifier

### General Description

The National CLC5602 has a new output stage that delivers high output drive current (130mA), but consumes minimal quiescent supply current (1.5mA/ch) from a single 5V supply. Its current feedback architecture, fabricated in an advanced complementary bipolar process, maintains consistent performance over a wide range of gains and signal levels, and has a linear phase response up to one half of the -3dB frequency.

The CLC5602 offers a 0.1dB gain flatness to 22MHz and differential gain and phase errors of 0.06 and 0.02%. These features are ideal for professional and consumer video applications.

The CLC5602 offers superior dynamic performance with a 135MHz small-signal bandwidth, 300V/ $\mu$ s slew rate and a 5.7ns rise/fall times ( $2V_{STEP}$ ). The combination of low quiescent power, high output current drive, and high speed performance make the CLC5602 well suited for many battery powered personal communication/computing systems.

The ability to drive low impedance, highly capacitive loads, makes the CLC5602 ideal for single ended cable applications. It also drives low impedance loads with minimum distortion. The CLC5602 will drive a 100 $\Omega$  load with only -86/-85dBc second/third harmonic distortion ( $A_V = +2$ ,  $V_{OUT} = 2V_{PP}$ ,  $f = 1\text{MHz}$ ). With a 25 $\Omega$  load, and the same conditions, it produces only -86/-72dBc second/third harmonic distortion.

The CLC5602 can also be used for driving differential-input step-up transformers for applications such as Asynchronous Digital Subscriber Lines (ADSL) or High-Bit-Rate Digital Subscriber Lines (HDSL).

When driving the input of high resolution A/D converters, the CLC5602 provides excellent -87/-95dBc second/third harmonic distortion ( $A_V = +2$ ,  $V_{OUT} = 2V_{PP}$ ,  $f = 1\text{MHz}$ ,  $R_L = 1\text{k}\Omega$ ) and fast settling time.

### Features

- 130mA output current

- 0.06%, 0.02° differential gain, phase
- 1.5mA/ch supply current
- 135MHz bandwidth ( $A_V = +2$ )
- -87/-95dBc HD2/HD3 (1MHz)
- 15ns settling to 0.05%
- 300V/ $\mu$ s slew rate
- Stable for capacitive loads up to 1000pf
- Single 5V or  $\pm 5\text{V}$  supplies

### Applications

- Video line driver
- ADSL/HDSL driver
- Coaxial cable driver
- UTP differential line driver
- Transformer/coil driver
- High capacitive load driver
- Portable/battery powered applications
- Differential A/D driver

## Application Division

The CLC5602 is a current feedback amplifier fabricated in an advanced complementary bipolar process. The CLC5602 operates from a single 5V supply or dual  $\pm 5V$  supplies. Operating from a single supply, the CLC5602 has the following features:

- Provides 100mA of output current while consuming 7.5mW of power
- Offers low  $-80/-82$ dB 2nd and 3rd harmonic distortion
- Provides BW60MHz and 1MHz distortion  $< -65$ dBc at  $V_O = 2.0V_{PP}$

The CLC5602 performance is further enhanced in  $\pm 5V$  supply applications as indicated in the  **$\pm 5V$  Electrical Characteristics** table and  **$\pm 5V$  Typical Performance** plots.

### Current Feedback Amplifiers

Some of the key features of current feedback technology are:

- Independence of AC bandwidth and voltage gain
- Inherently stable at unity gain
- Adjustable frequency response with feedback resistor
- High slew rate
- Fast settling

Current feedback operation can be described using a simple equation. The voltage gain for a non-inverting or inverting current feedback amplifier is approximately by Equation 1.

$$\frac{V_o}{V_{in}} = \frac{A_V}{1 + \frac{R_f}{Z(j\omega)}} \quad (1)$$

where:

- $A_V$  is the closed loop DC voltage gain
- $R_f$  is the feedback resistor
- $Z(j\omega)$  is the CLC5602's open loop transimpedance gain
- $Z(j\omega)/R_f$  is the loop gain

The denominator of Equation 1 is approximately equal to 1 at low frequencies. Near the  $-3$ dB corner frequency, the interaction between  $R_f$  and  $Z(j\omega)$  dominates the circuit performance. The value of the feedback resistor has a large affect on the circuits performance. Increasing  $R_f$  has the following affects:

- Decreases loop gain
- Decreases bandwidth
- Reduces gain peaking

## Application Division (Continued)

- Lowers pulse response overshoot
- Affects frequency response phase linearity

Refer to the **Feedback Resistor Selection** section for more details on selecting a feedback resistor value.

### CLC5602 Design Information

**Single Supply Operation ( $V_{CC}=+5V$ ,  $V_{EE}=GND$ )** The specifications given in the +5V Electrical Characteristics table for single supply operation are measured with a common mode voltage ( $V_{cm}$ ) of 2.5V.  $V_{cm}$  is the voltage around which the inputs are applied and the output voltages are specified.

Operating from a single +5V supply, the Common Mode Input Range (CMIR) of the CLC5602 is typically +0.8V to +4.2V. The typical output range with  $R_L=100\Omega$  is +1.0V to +4.0V.

For single supply DC coupled operation, keep input signal levels above 0.8V DC. For input signals that drop below 0.8V DC, AC coupling and level shifting the signal are recommended. The non-inverting and inverting configurations for both input conditions are illustrated in the following 2 sections.

**DC Coupled Single Supply Operation** Figure 1 and Figure 2 show the recommended non-inverting and inverting configurations for input signals that remain above 0.8V DC.

FIGURE 1. Non-Inverting Configuration

FIGURE 2. Inverting Configuration

### AC Coupled Single Supply Operation

Figure 3 and Figure 4 show possible non-inverting and inverting configurations for input signals that go below 0.8V DC. The input is AC coupled to prevent the need for level

shifting the input signal at the source. The resistive voltage divider biases the non-inverting input to  $V_{CC} \div 2 = 2.5V$  (For  $V_{CC} = +5V$ ).

FIGURE 3. AC Coupled Non-Inverting Configuration

FIGURE 4. AC Coupled Inverting Configuration

### Dual Supply Operation

The CLC5602 operates on dual supplies as well as single supplies. The non-inverting and inverting configurations are shown in Figure 5 and Figure 6.

FIGURE 5. Dual Supply Non-Inverting Configuration

## Application Division (Continued)

DS015000-44

**FIGURE 6. Dual Supply Inverting Configuration**

### Feedback Resistor Selection

The feedback resistor,  $R_f$ , affects the loop gain and frequency response of a current feedback amplifier. Optimum performance of the CLC5602, at a gain of  $+2V/V$ , is achieved with  $R_f$  equal to  $750\Omega$ . The frequency response plots in the Typical Performance sections illustrate the recommended  $R_f$  for several gains. These recommended values of  $R_f$  provide the maximum bandwidth with minimal peaking. Within limits,  $R_f$  can be adjusted to optimize the frequency response.

- Decrease  $R_f$  to peak frequency response and extend bandwidth
- Increase  $R_f$  to roll off frequency response and compress bandwidth

As a rule of thumb, if the recommended  $R_f$  is doubled, then the bandwidth will be cut in half.

### Unity Gain Operation

The recommended  $R_f$  for unity gain ( $+1V/V$ ) operation is  $1k\Omega$ .  $R_f$  is left open. Parasitic capacitance at the inverting node may require a slight increase in  $R_f$  to maintain a flat frequency response.

### Load Termination

The CLC5602 can source and sink near equal amounts of current. For optimum performance, the load should be tied to  $V_{cm}$ .

### Driving Cables and Capacitive Loads

When driving cables, double termination is used to prevent reflections. For capacitive load applications, a small series resistor at the output of the CLC5602 will improve stability and settling performance. The **Frequency Response vs.  $C_L$**  plot, shown below in *Figure 7*, gives the recommended series resistance value for optimum flatness at various capacitive loads.

DS015000-45

**FIGURE 7. Frequency Response vs.  $C_L$**

### Transmission Line Matching

One method for matching the characteristic impedance ( $Z_0$ ) of a transmission line or cable is to place the appropriate resistor at the input or output of the amplifier.

*Figure 8* shows typical inverting and non-inverting circuit configurations for matching transmission lines.

Non-inverting gain applications:

- Connect  $R_3$  directly to ground.
- Make  $R_1$ ,  $R_2$ ,  $R_6$ , and  $R_7$  equal to  $Z_0$ .
- Use  $R_3$  to isolate the amplifier from reactive loading caused by the transmission line, or by parasitics.

DS015000-46

**FIGURE 8. Transmission Line Matching**

Inverting gain applications:

- Connect  $R_3$  directly to ground.
- Make  $R_4$ ,  $R_6$ , and  $R_7$  equal to  $Z_0$ .
- Make  $R_5 \parallel R_9 = Z_0$ .

The input and output matching resistors attenuate the signal by a factor of 2, therefore additional gain is needed. Use  $C_6$  to match the output transmission line over a greater frequency range.  $C_6$  compensates for the increase of the amplifier's output impedance with frequency.

### Power Dissipation

Follow these steps to determine the power consumption of the CLC5602:

1. Calculate the quiescent (no-load) power:  $P_{amp} = 1CC(V_{CC} - V_{EE})$
2. Calculate the RMS power at the output stage:  $P_o = (V_{CC} - V_{load})(I_{load})$ , where  $V_{load}$  and  $I_{load}$  are the RMS voltage and current across the external load.
3. Calculate the total RMS power:  $P_t = P_{amp} + P_o$

## Application Division (Continued)

The maximum power that the DIP and SOIC packages can dissipate at a given temperature is illustrated in *Figure 9*. The power derating curve for any CLC5602 package can be derived by utilizing the following equation:

$$\frac{(150^\circ - T_{amb})}{\theta_{JA}}$$

where  $T_{amb}$  = Ambient temperature ( $^\circ\text{C}$ )

$\theta_{JA}$  = Thermal resistance, from junction to ambient, for a given package ( $^\circ\text{C/W}$ )

FIGURE 9. Power Derating Curves

### Layout Considerations

A proper printed circuit layout is essential for achieving high frequency performance. National provides evaluation boards for the CLC5602 (CLC730038-DIP, CLC730036-SOIC) and suggests their use as a guide for high frequency layout and as an aid for device testing and characterization.

General layout and supply bypassing play major roles in high frequency performance. Follow the steps below as a basis for high frequency layout:

- Include 6.8 $\mu\text{F}$  tantalum and 0.1 $\mu\text{F}$  ceramic capacitors on both supplies.
- Place the 6.8 $\mu\text{F}$  capacitors within 0.75 inches of the power pins.
- Place the 0.1 $\mu\text{F}$  capacitors less than 0.1 inches from the power pins.
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance.
- Minimize all trace lengths to reduce series inductances.
- Use flush-mount printed circuit board pins for prototyping, never use high profile DIP sockets.

### Evaluation Board Information

A data sheet is available for the CLC730038/CLC730036 evaluation boards. The evaluation board data sheet provides:

- Evaluation board schematics
- Evaluation board layouts
- General information about the boards

The evaluation boards are designed to accommodate dual supplies. The boards can be modified to provide single supply operation. For best performance; 1) do not connect the unused supply, 2) ground the unused supply pin.

### SPICE Models

SPICE models provide a means to evaluate amplifier designs. Free SPICE models are available for National's monolithic amplifiers that:

- Support Berkeley SPICE 2G and its many derivatives
- Reproduce typical DC, AC, Transient, and Noise performance
- Support room temperature simulations

The readme file that accompanies the diskette lists released models, and provides a list of modeled parameters. The application note OA-18, Simulation SPICE Models for National's Op Amps, contains schematics and a reproduction of the readme file.

### Application Circuits

#### Single Supply Cable Driver

The typical application shown below shows one of the CLC5602 amplifiers driving 10m of 75 $\Omega$  coaxial cable. The CLC5602 is set for a gain of +2V/V to compensate for the divide-by-two voltage drop at  $V_o$ .

DS015000-49

FIGURE 10. Single Supply Cable Driver

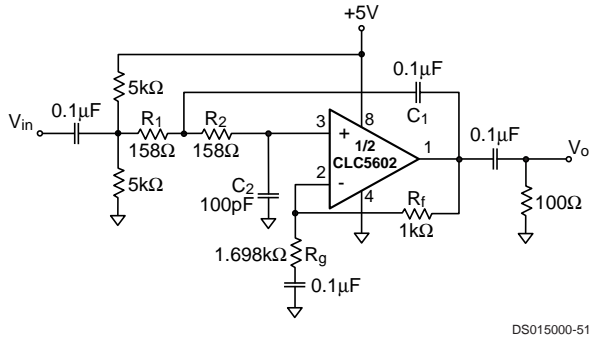

DS015000-50

FIGURE 11. Response After 10m of Cable

#### Single Supply Lowpass Filter

*Figure 12* and *Figure 13* illustrate a lowpass filter and design equations. The circuit operates from a single supply of +5V. The voltage divider biases the non-inverting input to 2.5V. And the input is AC coupled to prevent the need for level shifting the input signal at the source. Use the design equations to determine  $R_1$ ,  $R_2$ ,  $C_1$ , and  $C_2$  based on the desired Q and corner frequency.

Application Division (Continued)

DS015000-51

FIGURE 12. Lowpass Filter Topology

$$\text{Gain} = K = 1 + \frac{R_f}{R_g}$$

$$\text{Corner frequency} = \omega_c = \sqrt{\frac{1}{R_1 R_2 C_1 C_2}}$$

$$Q = \frac{1}{\sqrt{\frac{R_2 C_2}{R_1 C_1} + \frac{R_1 C_2}{R_2 C_1} + (1-K) \sqrt{\frac{R_1 C_1}{R_2 C_2}}}}$$

For  $R_1 = R_2 = R$  and  $C_1 = C_2 = C$

$$\omega_c = \frac{1}{RC}$$

$$Q = \frac{1}{(3-K)}$$

DS015000-52

FIGURE 13. Design Equations

This example illustrates a lowpass filter with  $Q = 0.707$  and corner frequency  $f_c = 10\text{MHz}$ . A  $Q$  of  $0.707$  was chosen to achieve a maximally flat, Butterworth response. Figure 14 indicates the filter response.

DS015000-53

FIGURE 14. Lowpass Response

Differential Line Driver with Load Impedance Conversion

The circuit shown in the **Typical Application** schematic on the front page and in Figure 15, operates as a differential line driver. The transformer converts the load impedance to a value that best matches the CLC5602's output capabilities. The single-ended input signal is converted to a differential signal by the CLC5602. The line's characteristic impedance is matched at both the input and the output. The schematic shows Unshielded Twisted Pair for the transmission line; other types of lines can also be driven.

DS015000-54

FIGURE 15. Differential Line Driver with Load Impedance Conversion

Set up the CLC5602 as a difference amplifier:

$$\frac{V_d}{V_{in}} = 2 \cdot \left( 1 + \frac{R_{f1}}{R_{g1}} \right) = 2 \cdot \frac{R_{f2}}{R_{g2}}$$

Make the best use of the CLC5602's output drive capability as follows:

$$R_m + R_{eq} = \frac{2 \cdot V_{max}}{I_{max}}$$

where  $R_{eq}$  is the transformed value of the load impedance,  $V_{max}$  is the Output Voltage Range, and  $I_{max}$  is the maximum Output Current.

Match the line's characteristic impedance:

$$R_L = Z_0$$

$$R_m = R_{eq}$$

$$n = \sqrt{\frac{R_L}{R_{eq}}}$$

Select the transformer so that it loads the line with a value very near  $Z_0$  over frequency range. The output impedance of the CLC5602 also affects the match. With an ideal transformer we obtain:

$$\text{Return Loss} = -20 \cdot \log_{10} \left| \frac{n^2 \cdot Z_{O(5602)}(j\omega)}{Z_0} \right|, \text{dB}$$

where  $Z_{O(5602)}(j\omega)$  is the output impedance of the CLC5602 and  $|Z_{O(5602)}(j\omega)| \ll R_m$ .

The load voltage and current will fall in the ranges:

## Application Division (Continued)

$$|V_o| \leq n \cdot V_{\max}$$

$$|I_o| \leq \frac{I_{\max}}{n}$$

The CLC5602's high output drive current and low distortion make it a good choice for the application.

### Full Duplex Cable Driver

The circuit shown in Fig 16 below, operates as a full duplex cable driver which allows simultaneous transmission and reception of signals on one transmission line. The circuit on either side of the transmission line uses are CLC5602 as a cable driver, and the second CLC5602 as a receiver.  $V_{oA}$  is an attenuated version of  $V_{inA}$ , while  $V_{oB}$  is an attenuated of  $V_{inB}$ .

**Full Duplex Cable Driver**

$R_{m1}$  is used to match the transmission line.  $R_{f2}$  and  $R_{g2}$  set the DC gain of the CLC5602, which is used in a difference mode.  $R_{f2}$  provides good CMRR and DC offset. The

transmitting CLC5602's are shown in a unity gain configuration because they consume the least power of any gain, for a given load. For proper operation we need  $R_{f2} = R_{g2}$ .

The receiver output voltage are:

$$V_{outA(B)} \approx V_{inA(B)} \cdot A + \frac{V_{inB(A)}}{2} \cdot \left( 1 - \frac{R_{f2}}{R_{g2}} + \frac{Z_{O(5602)}(j\omega)}{R_{m1}} \right)$$

where  $A$  is the attenuation of the cable,  $Z_{O(5602)}(j\omega)$  is the output impedance of the CLC5602 (see the *Close-Loop Output Resistance* plot), and  $|Z_{O(5602)}(j\omega)| \ll R_{m1}$ .

We selected the component values as follows:

- $R_{f1} = 1.0k\Omega$ , the recommended value for the CLC5602 at unity gain
- $R_{m1} = Z_O = 50\Omega$ , the characteristic impedance of the transmission line
- $R_{f2} = R_{g2} = 750\Omega \geq R_{m1}$ , the recommended value for the CLC5602 at  $A_V = 2$

$$R_{t2} = (R_{f2} \parallel R_{g2}) \pm \frac{R_{m1}}{2} = 25\Omega$$

These values give excellent isolation from the other input:

$$\frac{V_{oA(B)}}{V_{inB(A)}} \approx -38dB, f = 5.0MHz$$

The CLC5602 provides large output current drive, while consuming little supply current, at the nominal bias point. It also produces low distortion with large signal swings and heavy loads. These features make the CLC5602 an excellent choice for driving transmission lines.

## Notes

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
