Extended Temperature Serial Interface CODEC/Filter COMBO Family

Check for Samples: TP3054-X, TP3057-X

FEATURES

- **−40°C to +85°C Operation**
- **Complete CODEC and Filtering System (COMBO) Including:**
  - **Transmit High-Pass and Low-Pass Filtering**
  - **Receive Low-Pass Filter with Sin x/x Correction**
  - **Active RC Noise Filters**
  - **μ-Law or A-Law Compatible COder and DECoder**
  - **Internal Precision Voltage Reference**
  - **Serial I/O Interface**
  - **Internal Auto-Zero Circuitry**
- **μ-Law, 16-Pin - TP3054**
- **A-Law, 16-Pin - TP3057**
- **Designed for D3/D4 and CCITT Spplications**
- **±5V Operation**
- **Low Operating Power - Typically 50 mW**
- **Power-Down Standby Mode - Typically 3 mW**
- **Automatic Power-Down**
- **TTL or CMOS Compatible Digital Interfaces**
- **Maximizes Line Interface Card Circuit Density**
- **Dual-In-Line or PCC Surface Mount Packages**
- **See also AN-370, "Techniques for Designing with CODEC/Filter COMBO Circuits" (SNLA136)**

DESCRIPTION

The TP3054, TP3057 family consists of μ-law and A-law monolithic PCM CODEC/filters utilizing the A/D and D/A conversion architecture shown in Figure 3, and a serial PCM interface. The devices are fabricated using TI's advanced double-poly CMOS process (microCMOS).

The encode portion of each device consists of an input gain adjust amplifier, an active RC pre-filter which eliminates very high frequency noise prior to entering a switched-capacitor band-pass filter that rejects signals below 200 Hz and above 3400 Hz. Also included are auto-zero circuitry and a companding coder which samples the filtered signal and encodes it in the companded μ-law or A-law PCM format. The decode portion of each device consists of an expanding decoder, which reconstructs the analog signal from the companded μ-law or A-law code, a low-pass filter which corrects for the sin x/x response of the decoder output and rejects signals above 3400 Hz followed by a single-ended power amplifier capable of driving low impedance loads. The devices require two 1.536 MHz, 1.544 MHz or 2.048 MHz transmit and receive master clocks, which may be asynchronous; transmit and receive bit clocks, which may vary from 64 kHz to 2.048 MHz; and transmit and receive frame sync pulses. The timing of the frame sync pulses and PCM data is compatible with both industry standard formats.

PIN DESCRIPTIONS

Symbol	Function
V_{BB}	Negative power supply pin.
	$V_{BB} = -5V \pm 5\%$.
GNDA	Analog ground. All signals are referenced to this pin.
VF_RO	Analog output of the receive power amplifier.
V_{CC}	Positive power supply pin.
	$V_{CC} = +5V \pm 5\%$.
FS_R	Receive frame sync pulse which enables $BCLK_R$ to shift PCM data into D_R. FS_R is an 8 kHz pulse train. See Figure 4 and Figure 5 for timing details.
D_R	Receive data input. PCM data is shifted into D_R following the FS_R leading edge.
$BCLK_R$/CLKSEL	The bit clock which shifts data into D_R after the FS_R leading edge. May vary from 64 kHz to 2.048 MHz. Alternatively, may be a logic input which selects either 1.536 MHz/1.544 MHz or 2.048 MHz for master clock in synchronous mode and $BCLK_X$ is used for both transmit and receive directions (see Table 1).
$MCLK_R$/PDN	Receive master clock. Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_X$, but should be synchronous with $MCLK_X$ for best performance. When $MCLK_R$ is connected continuously low, $MCLK_X$ is selected for all internal timing. When $MCLK_R$ is connected continuously high, the device is powered down.
$MCLK_X$	Transmit master clock. Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_R$. Best performance is realized from synchronous operation.
FS_X	Transmit frame sync pulse input which enables $BCLK_X$ to shift out the PCM data on D_X. FS_X is an 8 kHz pulse train, see Figure 4 and Figure 5 for timing details.
$BCLK_X$	The bit clock which shifts out the PCM data on D_X. May vary from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.

PIN DESCRIPTIONS (continued)

Symbol	Function
D_X	The TRI-STATE PCM data output which is enabled by FS_X.
$\overline{TS_X}$	Open drain output which pulses low during the encoder time slot.
GS_X	Analog output of the transmit input amplifier. Used to externally set gain.
VF_XI^-	Inverting input of the transmit input amplifier.
VF_XI^+	Non-inverting input of the transmit input amplifier.

Functional Description

POWER-UP

When power is first applied, power-on reset circuitry initializes the COMBO and places it into a power-down state. All non-essential circuits are deactivated and the D_X and VF_RO outputs are put in high impedance states. To power-up the device, a logical low level or clock must be applied to the $MCLK_R$/PDN pin *and* FS_X and/or FS_R pulses must be present. Thus, 2 power-down control modes are available. The first is to pull the $MCLK_R$/PDN pin high; the alternative is to hold both FS_X and FS_R inputs continuously low—the device will power-down approximately 1 ms after the last FS_X or FS_R pulse. Power-up will occur on the first FS_X or FS_R pulse. The TRI-STATE PCM data output, D_X, will remain in the high impedance state until the second FS_X pulse.

SYNCHRONOUS OPERATION

For synchronous operation, the same master clock and bit clock should be used for both the transmit and receive directions. In this mode, a clock must be applied to $MCLK_X$ and the $MCLK_R$/PDN pin can be used as a power-down control. A low level on $MCLK_R$/PDN powers up the device and a high level powers down the device. In either case, $MCLK_X$ will be selected as the master clock for both the transmit and receive circuits. A bit clock must also be applied to $BCLK_X$ and the $BCLK_R$/CLKSEL can be used to select the proper internal divider for a master clock of 1.536 MHz, 1.544 MHz or 2.048 MHz. For 1.544 MHz operation, the device automatically compensates for the 193rd clock pulse each frame.

With a fixed level on the $BCLK_R$/CLKSEL pin, $BCLK_X$ will be selected as the bit clock for both the transmit and receive directions. Table 1 indicates the frequencies of operation which can be selected, depending on the state of $BCLK_R$/CLKSEL. In this synchronous mode, the bit clock, $BCLK_X$, may be from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.

Each FS_X pulse begins the encoding cycle and the PCM data from the previous encode cycle is shifted out of the enabled D_X output on the positive edge of $BCLK_X$. After 8 bit clock periods, the TRI-STATE D_X output is returned to a high impedance state. With an FS_R pulse, PCM data is latched via the D_R input on the negative edge of $BCLK_X$ (or $BCLK_R$ if running). FS_X and FS_R must be synchronous with $MCLK_{X/R}$.

Table 1. Selection of Master Clock Frequencies

BCLK_R/CLKSEL	Master Clock	
	Frequency Selected	
	TP3057	TP3054
Clocked	2.048 MHz	1.536 MHz or 1.544 MHz
0	1.536 MHz or 1.544 MHz	2.048 MHz
1	2.048 MHz	1.536 MHz or 1.544 MHz

Submit Documentation Feedback 3

ASYNCHRONOUS OPERATION

For asynchronous operation, separate transmit and receive clocks may be applied. $MCLK_X$ and $MCLK_R$ must be 2.048 MHz for the TP3057, or 1.536 MHz, 1.544 MHz for the TP3054, and need not be synchronous. For best transmission performance, however, $MCLK_R$ should be synchronous with $MCLK_X$, which is easily achieved by applying only static logic levels to the $MCLK_R$/PDN pin. This will automatically connect $MCLK_X$ to all internal $MCLK_R$ functions (see Pin Description above). For 1.544 MHz operation, the device automatically compensates for the 193rd clock pulse each frame. FS_X starts each encoding cycle and must be synchronous with $MCLK_X$ and $BCLK_X$. FS_R starts each decoding cycle and must be synchronous with $BCLK_R$. $BCLK_R$ must be a clock, the logic levels shown in Table 1 are not valid in asynchronous mode. $BCLK_X$ and $BCLK_R$ may operate from 64 kHz to 2.048 MHz.

SHORT FRAME SYNC OPERATION

The COMBO can utilize either a short frame sync pulse or a long frame sync pulse. Upon power initialization, the device assumes a short frame mode. In this mode, both frame sync pulses, FS_X and FS_R, must be one bit clock period long, with timing relationships specified in Figure 4. With FS_X high during a falling edge of $BCLK_X$, the next rising edge of $BCLK_X$ enables the D_X TRI-STATE output buffer, which will output the sign bit. The following seven rising edges clock out the remaining seven bits, and the next falling edge disables the D_X output. With FS_R high during a falling edge of $BCLK_R$ ($BCLK_X$ in synchronous mode), the next falling edge of $BCLK_R$ latches in the sign bit. The following seven falling edges latch in the seven remaining bits. All four devices may utilize the short frame sync pulse in synchronous or asynchronous operating mode.

LONG FRAME SYNC OPERATION

To use the long frame mode, both the frame sync pulses, FS_X and FS_R, must be three or more bit clock periods long, with timing relationships specified in Figure 5. Based on the transmit frame sync, FS_X, the COMBO will sense whether short or long frame sync pulses are being used. For 64 kHz operation, the frame sync pulse must be kept low for a minimum of 160 ns. The D_X TRI-STATE output buffer is enabled with the rising edge of FS_X or the rising edge of $BCLK_X$, whichever comes later, and the first bit clocked out is the sign bit. The following seven $BCLK_X$ rising edges clock out the remaining seven bits. The D_X output is disabled by the falling $BCLK_X$ edge following the eighth rising edge, or by FS_X going low, whichever comes later. A rising edge on the receive frame sync pulse, FS_R, will cause the PCM data at D_R to be latched in on the next eight falling edges of $BCLK_R$ ($BCLK_X$ in synchronous mode). All four devices may utilize the long frame sync pulse in synchronous or asynchronous mode.

In applications where the LSB bit is used for signalling, with FS_R two bit clock periods long, the decoder will interpret the lost LSB as "½" to minimize noise and distortion.

TRANSMIT SECTION

The transmit section input is an operational amplifier with provision for gain adjustment using two external resistors, see Figure 8. The low noise and wide bandwidth allow gains in excess of 20 dB across the audio passband to be realized. The op amp drives a unity-gain filter consisting of RC active pre-filter, followed by an eighth order switched-capacitor bandpass filter clocked at 256 kHz. The output of this filter directly drives the encoder sample-and-hold circuit. The A/D is of companding type according to µ-law (TP3054) or A-law (TP3057) coding conventions. A precision voltage reference is trimmed in manufacturing to provide an input overload (t_{MAX}) of nominally 2.5V peak (see Transmission Characteristics). The FS_X frame sync pulse controls the sampling of the filter output, and then the successive-approximation encoding cycle begins. The 8-bit code is then loaded into a buffer and shifted out through D_X at the next FS_X pulse. The total encoding delay will be approximately 165 µs (due to the transmit filter) plus 125 µs (due to encoding delay), which totals 290 µs. Any offset voltage due to the filters or comparator is cancelled by sign bit integration.

Product Folder Links: *TP3054-X TP3057-X*

RECEIVE SECTION

The receive section consists of an expanding DAC which drives a fifth order switched-capacitor low pass filter clocked at 256 kHz. The decoder is A-law (TP3057) or µ-law (TP3054) and the 5th order low pass filter corrects for the sin x/x attenuation due to the 8 kHz sample/hold. The filter is then followed by a 2nd order RC active post-filter/power amplifier capable of driving a 600Ω load to a level of 7.2 dBm. The receive section is unity-gain. Upon the occurrence of FS_R, the data at the D_R input is clocked in on the falling edge of the next eight $BCLK_R$ ($BCLK_X$) periods. At the end of the decoder time slot, the decoding cycle begins, and 10 µs later the decoder DAC output is updated. The total decoder delay is ~10 µs (decoder update) plus 110 µs (filter delay) plus 62.5 µs (½ frame), which gives approximately 180 µs.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings[(1)][(2)]

V_{CC} to GNDA		7V
V_{BB} to GNDA		−7V
Voltage at any Analog Input or Output		V_{CC}+0.3V to V_{BB}−0.3V
Voltage at any Digital Input or Output		V_{CC}+0.3V to GNDA−0.3V
Operating Temperature Range		−55°C to + 125°C
Storage Temperature Range		−65°C to +150°C
Lead Temperature	(Soldering, 10 sec.)	300°C

(1)   "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits.
(2)   If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

Electrical Characteristics

Unless otherwise noted, limits printed in **BOLD** characters are ensured for V_{CC} = +5.0V ±5%, V_{BB} = −5.0V ±5%; T_A = −40°C to +85°C by correlation with 100% electrical testing at T_A = 25°C. All other limits are assured by correlation with other production tests and/or product design and characterization. All signals referenced to GNDA. Typicals specified at V_{CC} = +5.0V, V_{BB} = −5.0V, T_A = 25°C.

		f=4 kHz−25 kHz	**38**			dB
		f=25 kHz−50 kHz	**35**			dB

(1) Measured by extrapolation from the distortion test result at −50 dBm0.
(2) $PPSR_X$, $NPSR_X$, and CT_{R-X} are measured with a −50 dBm0 activation signal applied to VF_XI^+.

Transmission Characteristics (continued)

Unless otherwise noted, limits printed in **BOLD** characters are ensured for V_{CC} = +5.0V ±5%, V_{BB} = −5.0V ±5%; T_A = −40°C to +85°C by correlation with 100% electrical testing at T_A = 25°C. All other limits are assured by correlation with other production tests and/or product design and characterization. GNDA = 0V, f = 1.02 kHz, V_{IN} = 0 dBm0, transmit input amplifier connected for unity gain non inverting. Typicals are specified at V_{CC} = +5.0V, V_{BB} = −5.0V, T_A = 25°C.

Symbol	Parameter	Conditions		Min	Typ	Max	Units
SOS	Spurious Out-of-Band Signals at the Channel Output	Loop Around Measurement, 0 dBm0, 300 Hz to 3400 Hz Input PCM Code Applied at D_R.				−30	dB

APPLICATIONS INFORMATION

POWER SUPPLIES

While the pins of the TP3050 family are well protected against electrical misuse, it is recommended that the standard CMOS practice be followed, ensuring that ground is connected to the device before any other connections are made. In applications where the printed circuit board may be plugged into a "hot" socket with power and clocks already present, an extra long ground pin in the connector should be used.

All ground connections to each device should meet at a common point as close as possible to the GNDA pin. This minimizes the interaction of ground return currents flowing through a common bus impedance. 0.1 μF supply decoupling capacitors should be connected from this common ground point to V_{CC} and V_{BB}, as close to device pins as possible.

For best performance, the ground point of each CODEC/FILTER on a card should be connected to a common card ground in star formation, rather than via a ground bus.

This common ground point should be decoupled to V_{CC} and V_{BB} with 10 μF capacitors.

RECEIVE GAIN ADJUSTMENT

For applications where a TP3050 family CODEC/filter receive output must drive a 600Ω load, but a peak swing lower than ±2.5V is required, the receive gain can be easily adjusted by inserting a matched T-pad or π-pad at the output. Table 2 lists the required resistor values for 600Ω terminations. As these are generally non-standard values, the equations can be used to compute the attenuation of the closest practical set of resistors. It may be necessary to use unequal values for the R1 or R4 arms of the attenuators to achieve a precise attenuation. Generally it is tolerable to allow a small deviation of the input impedance from nominal while still maintaining a good return loss. For example a 30 dB return loss against 600Ω is obtained if the output impedance of the attenuator is in the range 282Ω to 319Ω (assuming a perfect transformer).
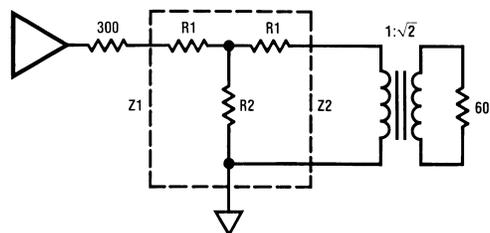

$$R1 = Z1\left(\frac{N^2 + 1}{N^2 - 1}\right) - 2\sqrt{Z1.Z2}\left(\frac{N}{N^2 - 1}\right)$$

$$R2 = 2\sqrt{Z1.Z2}\left(\frac{N}{N^2 - 1}\right)$$
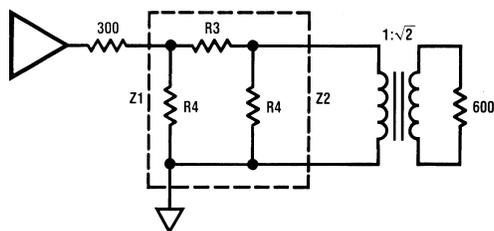

Where: $N = \sqrt{\dfrac{POWER\ IN}{POWER\ OUT}}$

and

$S = \sqrt{\dfrac{Z1}{Z2}}$

Also: $Z = \sqrt{Z_{SC} \bullet Z_{OC}}$

Where Z_{SC} = impedance with short circuit termination

and Z_{OC} = impedance with open circuit termination

Figure 6. T-Pad Attenuator

$$R3 = \sqrt{\frac{Z1.Z2}{2}\left(\frac{N^2 - 1}{N}\right)}$$
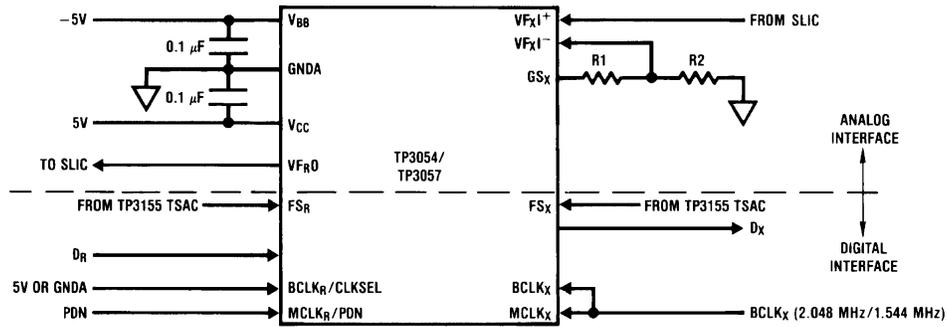

$$R3 = Z1\left(\frac{N^2 - 1}{N^2 - 2NS + 1}\right)$$

Note: See Application Note 370 for further details.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
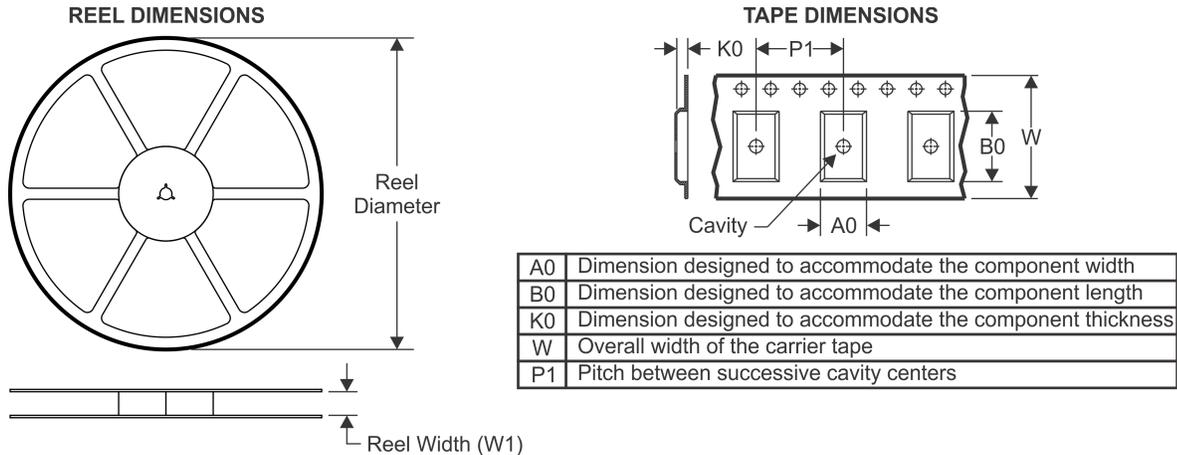

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
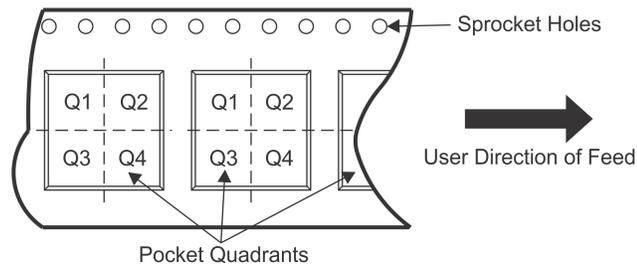

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
