

# LM2675EP Enhanced Plastic SIMPLE SWITCHER<sup>®</sup> Power Converter High Efficiency 1A Step-Down Voltage Regulator

Check for Samples: [LM2675EP](#)

## FEATURES

- Efficiency up to 96%
- Available in SOIC-8, 8-pin PDIP and WSON Packages
- Computer Design Software *LM267X Made Simple* (version 6.0)
- Simple and Easy to Design with
- Requires only 5 External Components
- Uses Readily Available Standard Inductors
- 3.3V, 5.0V, 12V, and Adjustable Output Versions
- Adjustable Version Output Voltage Range: 1.21V to 37V
- $\pm 1.5\%$  Max Output Voltage Tolerance over Line and Load Conditions
- Ensured 1A Output Load Current
- 0.25 $\Omega$  DMOS Output Switch
- Wide Input Voltage Range: 8V to 40V
- 260 kHz Fixed Frequency Internal Oscillator
- TTL Shutdown Capability, Low Power Standby Mode
- Thermal Shutdown and Current Limit Protection

## TYPICAL APPLICATIONS

- Simple High Efficiency (>90%) Step-Down (Buck) Regulator
- Efficient Pre-Regulator for Linear Regulators
- Positive-to-Negative Converter
- Selected Military Applications
- Selected Avionics Applications

## DESCRIPTION

The LM2675EP series of regulators are monolithic integrated circuits built with a LMDMOS process. These regulators provide all the active functions for a step-down (buck) switching regulator, capable of driving a 1A load current with excellent line and load regulation. These devices are available in fixed output voltages of 3.3V, 5.0V, 12V, and an adjustable output version.

Requiring a minimum number of external components, these regulators are simple to use and include patented internal frequency compensation (Patent Nos. 5,382,918 and 5,514,947) and a fixed frequency oscillator.

The LM2675EP series operates at a switching frequency of 260 kHz, thus allowing smaller sized filter components than what would be needed with lower frequency switching regulators. Because of its very high efficiency (>90%), the copper traces on the printed circuit board are the only heat sinking needed.

A family of standard inductors for use with the LM2675EP are available from several different manufacturers. This feature greatly simplifies the design of switch-mode power supplies using these advanced ICs. Also included in the datasheet are selector guides for diodes and capacitors designed to work in switch-mode power supplies.

Other features include an ensured  $\pm 1.5\%$  tolerance on output voltage within specified input voltages and output load conditions, and  $\pm 10\%$  on the oscillator frequency. External shutdown is included, featuring typically 50  $\mu$ A stand-by current. The output switch includes current limiting, as well as thermal shutdown for full protection under fault conditions.

To simplify the LM2675EP buck regulator design procedure, there exists computer design software, *LM267X Made Simple* version 6.0.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**DESCRIPTION (CONTINUED)****ENHANCED PLASTIC**

- Extended Temperature Performance of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Baseline Control - Single Fab & Assembly Site
- Process Change Notification (PCN)
- Qualification & Reliability Data
- Solder (PbSn) Lead Finish is standard
- Enhanced Diminishing Manufacturing Sources (DMS) Support

**Typical Application**

Connection Diagrams

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings<sup>(1)(2)</sup>

Supply Voltage			45V
ON/OFF Pin Voltage			$-0.1V \leq V_{SH} \leq 6V$
Switch Voltage to Ground			-1V
Boost Pin Voltage			$V_{SW} + 8V$
Feedback Pin Voltage			$-0.3V \leq V_{FB} \leq 14V$
ESD Susceptibility			
Human Body Model <sup>(3)</sup>			2 kV
Power Dissipation			Internally Limited
Storage Temperature Range			-65°C to +150°C
Lead Temperature	D Package	Vapor Phase (60s)	+215°C
		Infrared (15s)	+220°C
P Package (Soldering, 10s)			+260°C
WSON Package (See AN-1187)			
Maximum Junction Temperature			+150°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but device parameter specifications may not be ensured under these conditions. For ensured specifications and test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) The human body model is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin.

### Operating Ratings

Supply Voltage	6.5V to 40V
Junction Temperature Range	$-40^{\circ}\text{C} \leq T_J \leq +125^{\circ}\text{C}$

## Electrical Characteristics

### LM2675-3.3EP

Specifications with standard type face are for  $T_J = 25^\circ\text{C}$ , and those with **bold type face** apply over **full Operating Temperature Range**.

Symbol	Parameter	Conditions	Typical <sup>(1)</sup>	Min <sup>(2)</sup>	Max <sup>(2)</sup>	Units
<b>SYSTEM PARAMETERS</b> Test Circuit (See <a href="#">Figure 22</a> and <sup>(3)</sup> )						
$V_{OUT}$	Output Voltage	$V_{IN} = 8\text{V to }40\text{V}$ , $I_{LOAD} = 20\text{ mA to }1\text{A}$	3.3	3.251/ <b>3.201</b>	3.350/ <b>3.399</b>	V
$V_{OUT}$	Output Voltage	$V_{IN} = 6.5\text{V to }40\text{V}$ , $I_{LOAD} = 20\text{ mA to }500\text{ mA}$	3.3	3.251/ <b>3.201</b>	3.350/ <b>3.399</b>	V
$\eta$	Efficiency	$V_{IN} = 12\text{V}$ , $I_{LOAD} = 1\text{A}$	86			%

- (1) Typical numbers are at  $25^\circ\text{C}$  and represent the most likely norm.
- (2) All limits ensured at room temperature (standard type face) and at **temperature extremes (bold type face)**. All room temperature limits are 100% production tested. All limits at **temperature extremes** are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (3) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2675EP is used as shown in [Figure 22](#) [Figure 23](#) test circuits, system performance will be as specified by the system parameters section of the Electrical Characteristics.

### LM2675-5.0EP

Symbol	Parameter	Conditions	Typical <sup>(1)</sup>	Min <sup>(2)</sup>	Max <sup>(2)</sup>	Units
<b>SYSTEM PARAMETERS</b> Test Circuit (See <a href="#">Figure 22</a> and <sup>(3)</sup> )						
$V_{OUT}$	Output Voltage	$V_{IN} = 8\text{V to }40\text{V}$ , $I_{LOAD} = 20\text{ mA to }1\text{A}$	5.0	4.925/ <b>4.850</b>	5.075/ <b>5.150</b>	V
$V_{OUT}$	Output Voltage	$V_{IN} = 6.5\text{V to }40\text{V}$ , $I_{LOAD} = 20\text{ mA to }500\text{ mA}$	5.0	4.925/ <b>4.850</b>	5.075/ <b>5.150</b>	V
$\eta$	Efficiency	$V_{IN} = 12\text{V}$ , $I_{LOAD} = 1\text{A}$	90			%

- (1) Typical numbers are at  $25^\circ\text{C}$  and represent the most likely norm.
- (2) All limits ensured at room temperature (standard type face) and at **temperature extremes (bold type face)**. All room temperature limits are 100% production tested. All limits at **temperature extremes** are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (3) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2675EP is used as shown in [Figure 22](#) and [Figure 23](#) test circuits, system performance will be as specified by the system parameters section of the Electrical Characteristics.

### LM2675-12EP

Symbol	Parameter	Conditions	Typical <sup>(1)</sup>	Min <sup>(2)</sup>	Max <sup>(2)</sup>	Units
<b>SYSTEM PARAMETERS</b> Test Circuit (See <a href="#">Figure 22</a> and <sup>(3)</sup> )						
$V_{OUT}$	Output Voltage	$V_{IN} = 15\text{V to }40\text{V}$ , $I_{LOAD} = 20\text{ mA to }1\text{A}$	12	11.82/ <b>11.64</b>	12.18/ <b>12.36</b>	V
$\eta$	Efficiency	$V_{IN} = 24\text{V}$ , $I_{LOAD} = 1\text{A}$	94			%

- (1) Typical numbers are at  $25^\circ\text{C}$  and represent the most likely norm.
- (2) All limits ensured at room temperature (standard type face) and at **temperature extremes (bold type face)**. All room temperature limits are 100% production tested. All limits at **temperature extremes** are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (3) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2675EP is used as shown in [Figure 22](#) and [Figure 23](#) test circuits, system performance will be as specified by the system parameters section of the Electrical Characteristics.

Symbol	Parameter	Conditions	Typ <sup>(1)</sup>	Min <sup>(2)</sup>	Max <sup>(2)</sup>	Units
<b>SYSTEM PARAMETERS</b> Test Circuit (See <a href="#">Figure 23</a> and <sup>(3)</sup> )						
V <sub>FB</sub>	Feedback Voltage	V <sub>IN</sub> = 8V to 40V, I <sub>LOAD</sub> = 20 mA to 1A V <sub>OUT</sub> Programmed for 5V (see Circuit of <a href="#">Figure 23</a> )	1.210	1.192/ <b>1.174</b>	1.228/ <b>1.246</b>	V
V <sub>FB</sub>	Feedback Voltage	V <sub>IN</sub> = 6.5V to 40V, I <sub>LOAD</sub> = 20 mA to 500 mA V <sub>OUT</sub> Programmed for 5V (see Circuit of <a href="#">Figure 23</a> )	1.210	1.192/ <b>1.174</b>	1.228/ <b>1.246</b>	V
η	Efficiency	V <sub>IN</sub> = 12V, I <sub>LOAD</sub> = 1A	90			%

- (1) Typical numbers are at 25°C and represent the most likely norm.
- (2) All limits ensured at room temperature (standard type face) and at **temperature extremes (bold type face)**. All room temperature limits are 100% production tested. All limits at **temperature extremes** are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (3) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2675EP is used as shown in [Figure 22](#) and [Figure 23](#) test circuits, system performance will be as specified by the system parameters section of the Electrical Characteristics.

**All Output Voltage Versions**

Specifications with standard type face are for T<sub>J</sub> = 25°C, and those with **bold type face** apply over **full Operating Temperature Range**. Unless otherwise specified, V<sub>IN</sub> = 12V for the 3.3V, 5V, and Adjustable versions and V<sub>IN</sub> = 24V for the 12V version, and I<sub>LOAD</sub> = 100 mA.

Symbol	Parameters	Conditions	Typ	Min	Max	Units
<b>DEVICE PARAMETERS</b>						
I <sub>Q</sub>	Quiescent Current	V <sub>FEEDBACK</sub> = 8V For 3.3V, 5.0V, and ADJ Versions	2.5		3.6	mA
		V <sub>FEEDBACK</sub> = 15V For 12V Versions	2.5			mA
I <sub>STBY</sub>	Standby Quiescent Current	ON/ $\overline{\text{OFF}}$ Pin = 0V	50		100/ <b>150</b>	μA
I <sub>CL</sub>	Current Limit		1.55	1.25/ <b>1.2</b>	2.1/ <b>2.2</b>	A
I <sub>L</sub>	Output Leakage Current	V <sub>IN</sub> = 40V, ON/ $\overline{\text{OFF}}$ Pin = 0V V <sub>SWITCH</sub> = 0V	1		25	μA
		V <sub>SWITCH</sub> = -1V, ON/ $\overline{\text{OFF}}$ Pin = 0V	6		15	mA
R <sub>DS(ON)</sub>	Switch On-Resistance	I <sub>SWITCH</sub> = 1A	0.25		0.30/ <b>0.50</b>	Ω
f <sub>O</sub>	Oscillator Frequency	Measured at Switch Pin	260	<b>225</b>	<b>275</b>	kHz
D	Maximum Duty Cycle		95			%
	Minimum Duty Cycle		0			%
I <sub>BIAS</sub>	Feedback Bias Current	V <sub>FEEDBACK</sub> = 1.3V ADJ Version Only	85			nA
V <sub>S/D</sub>	ON/ $\overline{\text{OFF}}$ Pin Voltage Thresholds		1.4	<b>0.8</b>	<b>2.0</b>	V
I <sub>S/D</sub>	ON/ $\overline{\text{OFF}}$ Pin Current	ON/ $\overline{\text{OFF}}$ Pin = 0V	20	<b>7</b>	<b>37</b>	μA
θ <sub>JA</sub>	Thermal Resistance	P Package, Junction to Ambient <sup>(1)</sup>	95			°C/W
		D Package, Junction to Ambient <sup>(1)</sup>	105			

- (1) Junction to ambient thermal resistance with approximately 1 square inch of printed circuit board copper surrounding the leads. Additional copper area will lower thermal resistance further. See [Application Information](#) section in the application note accompanying this datasheet and the thermal model in **LM267X Made Simple** software (version 6.0). The value θ<sub>J-A</sub> for the WSON(NHN) package is specifically dependent on PCB trace area, trace material, and the number of layers and thermal vias. For improved thermal resistance and power dissipation for the WSON package, refer to Application Note AN-1187.

Adjustable Output Voltage Version**

## LM2675EP Series Buck Regulator Design Procedure (Fixed Output)

PROCEDURE (Fixed Output Voltage Version)	EXAMPLE (Fixed Output Voltage Version)
<i>To simplify the buck regulator design procedure, Texas Instruments is making available computer design software to be used with the SIMPLE SWITCHER® line of switching regulators. <b>LM267X Made Simple</b> version 6.0 is available on Windows® 3.1, NT, or 95 operating systems.</i>	
<b>Given:</b>	<b>Given:</b>
$V_{OUT}$ = Regulated Output Voltage (3.3V, 5V, or 12V) (1)	$V_{OUT} = 5V$ (2)
$V_{IN(max)}$ = Maximum DC Input Voltage (3)	$V_{IN(max)} = 12V$ (4)
$I_{LOAD(max)}$ = Maximum Load Current (5)	$I_{LOAD(max)} = 1A$ (6)
<b>1. Inductor Selection (L1)</b>	<b>1. Inductor Selection (L1)</b>
<b>A.</b> Select the correct inductor value selection guide from <a href="#">Figure 24</a> , <a href="#">Figure 25</a> or <a href="#">Figure 26</a> (output voltages of 3.3V, 5V, or 12V respectively). For all other voltages, see the design procedure for the adjustable version.	<b>A.</b> Use the <a href="#">inductor selection</a> guide for the 5V version shown in <a href="#">Figure 25</a> .
<b>B.</b> From the inductor value selection guide, identify the inductance region intersected by the Maximum Input Voltage line and the Maximum Load Current line. Each region is identified by an inductance value and an inductor code (LXX).	<b>B.</b> From the inductor value selection guide shown in <a href="#">Figure 25</a> , the inductance region intersected by the 12V horizontal line and the 1A vertical line is 33 $\mu H$ , and the inductor code is L23.
<b>C.</b> Select an appropriate inductor from the four manufacturer's part numbers listed in <a href="#">Table 1</a> . Each manufacturer makes a different style of inductor to allow flexibility in meeting various design requirements. Listed below are some of the differentiating characteristics of each manufacturer's inductors:	<b>C.</b> The inductance value required is 33 $\mu H$ . From the table in <a href="#">Table 1</a> , go to the L23 line and choose an inductor part number from any of the four manufacturers shown. (In most instances, both through hole and surface mount inductors are available.)
<i>Schott:</i> ferrite EP core inductors; these have very low leakage magnetic fields to reduce electro-magnetic interference (EMI) and are the lowest power loss inductors	
<i>Renco:</i> ferrite stick core inductors; benefits are typically lowest cost inductors and can withstand E•T and transient peak currents above rated value. Be aware that these inductors have an external magnetic field which may generate more EMI than other types of inductors.	
<i>Pulse:</i> powdered iron toroid core inductors; these can also be low cost and can withstand larger than normal E•T and transient peak currents. Toroid inductors have low EMI.	
<i>Coilcraft:</i> ferrite drum core inductors; these are the smallest physical size inductors, available only as SMT components. Be aware that these inductors also generate EMI—but less than stick inductors.	
Complete specifications for these inductors are available from the respective manufacturers. A table listing the manufacturers' phone numbers is located in <a href="#">Table 2</a> .	
<b>2. Output Capacitor Selection (C<sub>OUT</sub>)</b>	<b>2. Output Capacitor Selection (C<sub>OUT</sub>)</b>
<b>A.</b> Select an output capacitor from the output capacitor table in <a href="#">Table 3</a> . Using the output voltage and the inductance value found in the <a href="#">inductor selection</a> guide, step 1, locate the appropriate capacitor value and voltage rating.	<b>A.</b> Use the 5.0V section in the output capacitor table in <a href="#">Table 3</a> . Choose a capacitor value and voltage rating from the line that contains the inductance value of 33 $\mu H$ . The capacitance and voltage rating values corresponding to the 33 $\mu H$ inductor are the:
The capacitor list contains through-hole electrolytic capacitors from four different capacitor manufacturers and surface mount tantalum capacitors from two different capacitor manufacturers. It is recommended that both the manufacturers and the manufacturer's series that are listed in the table be used. A table listing the manufacturers' phone numbers is located in <a href="#">Table 4</a> .	Surface Mount: 68 $\mu F/10V$ Sprague 594D Series. 100 $\mu F/10V$ AVX TPS Series. Through Hole: 68 $\mu F/10V$ Sanyo OS-CON SA Series. 220 $\mu F/35V$ Sanyo MV-GX Series. / 220 $\mu F/35V$ Nichicon PL Series. / 220 $\mu F/35V$ Panasonic HFQ Series.

PROCEDURE (Fixed Output Voltage Version)	EXAMPLE (Fixed Output Voltage Version)
<p><b>3. Catch Diode Selection (D1)</b></p> <p><b>A.</b> In normal operation, the average current of the catch diode is the load current times the catch diode duty cycle, <math>1-D</math> (<math>D</math> is the switch duty cycle, which is approximately the output voltage divided by the input voltage). The largest value of the catch diode average current occurs at the maximum load current and maximum input voltage (minimum <math>D</math>). For normal operation, the catch diode current rating must be at least 1.3 times greater than its maximum average current. However, if the power supply design must withstand a continuous output short, the diode should have a current rating equal to the maximum current limit of the LM2675EP. The most stressful condition for this diode is a shorted output condition.</p> <p><b>B.</b> The reverse voltage rating of the diode should be at least 1.25 times the maximum input voltage.</p> <p><b>C.</b> Because of their fast switching speed and low forward voltage drop, Schottky diodes provide the best performance and efficiency. This Schottky diode must be located close to the LM2675EP using short leads and short printed circuit traces.</p>	<p><b>3. Catch Diode Selection (D1)</b></p> <p><b>A.</b> Refer to the table shown in <a href="#">Table 5</a>. In this example, a 1A, 20V Schottky diode will provide the best performance. If the circuit must withstand a continuous shorted output, a higher current Schottky diode is recommended.</p>
<p><b>4. Input Capacitor (<math>C_{IN}</math>)</b></p> <p>A low ESR aluminum or tantalum bypass capacitor is needed between the input pin and ground to prevent large voltage transients from appearing at the input. This capacitor should be located close to the IC using short leads. In addition, the RMS current rating of the input capacitor should be selected to be at least <math>\frac{1}{2}</math> the DC load current. The capacitor manufacturer data sheet must be checked to assure that this current rating is not exceeded. The curves shown in <a href="#">Figure 28</a> show typical RMS current ratings for several different aluminum electrolytic capacitor values. A parallel connection of two or more capacitors may be required to increase the total minimum RMS current rating to suit the application requirements. For an aluminum electrolytic capacitor, the voltage rating should be at least 1.25 times the maximum input voltage. Caution must be exercised if solid tantalum capacitors are used. The tantalum capacitor voltage rating should be twice the maximum input voltage. The tables in <a href="#">Table 7</a> show the recommended application voltage for AVX TPS and Sprague 594D tantalum capacitors. It is also recommended that they be surge current tested by the manufacturer. The TPS series available from AVX, and the 593D and 594D series from Sprague are all surge current tested. Another approach to minimize the surge current stresses on the input capacitor is to add a small inductor in series with the input supply line. Use caution when using ceramic capacitors for input bypassing, because it may cause severe ringing at the <math>V_{IN}</math> pin.</p>	<p><b>4. Input Capacitor (<math>C_{IN}</math>)</b></p> <p>The important parameters for the input capacitor are the input voltage rating and the RMS current rating. With a maximum input voltage of 12V, an aluminum electrolytic capacitor with a voltage rating greater than 15V (<math>1.25 \times V_{IN}</math>) would be needed. The next higher capacitor voltage rating is 16V. The RMS current rating requirement for the input capacitor in a buck regulator is approximately <math>\frac{1}{2}</math> the DC load current. In this example, with a 1A load, a capacitor with a RMS current rating of at least 500 mA is needed. The curves shown in <a href="#">Figure 28</a> can be used to select an appropriate input capacitor. From the curves, locate the 16V line and note which capacitor values have RMS current ratings greater than 500 mA. For a through hole design, a 330 <math>\mu</math>F/16V electrolytic capacitor (Panasonic HFQ series, Nichicon PL, Sanyo MV-GX series or equivalent) would be adequate. Other types or other manufacturers' capacitors can be used provided the RMS ripple current ratings are adequate. Additionally, for a complete surface mount design, electrolytic capacitors such as the Sanyo CV-C or CV-BS and the Nichicon WF or UR and the NIC Components NACZ series could be considered. For surface mount designs, solid tantalum capacitors can be used, but caution must be exercised with regard to the capacitor surge current rating and voltage rating. In this example, checking <a href="#">Table 7</a>, and the Sprague 594D series datasheet, a Sprague 594D 15 <math>\mu</math>F, 25V capacitor is adequate.</p>
<p><b>5. Boost Capacitor (<math>C_B</math>)</b></p> <p>This capacitor develops the necessary voltage to turn the switch gate on fully. All applications should use a 0.01 <math>\mu</math>F, 50V ceramic capacitor.</p>	<p><b>5. Boost Capacitor (<math>C_B</math>)</b></p> <p>For this application, and all applications, use a 0.01 <math>\mu</math>F, 50V ceramic capacitor.</p>

## LM2675EP Series Buck Regulator Design Procedure (Adjustable Output)

PROCEDURE (Adjustable Output Voltage Version)	EXAMPLE (Adjustable Output Voltage Version)
<i>To simplify the buck regulator design procedure, Texas Instruments is making available computer design software to be used with the SIMPLE SWITCHER® line of switching regulators. <b>LM267X Made Simple</b> version 6.0 is available for use on Windows® 3.1, NT, or 95 operating systems.</i>	
<b>Given:</b>	<b>Given:</b>
$V_{OUT}$ = Regulated Output Voltage (7)	$V_{OUT}$ = 20V (8)
$V_{IN(max)}$ = Maximum Input Voltage (9)	$V_{IN(max)}$ = 28V (10)
$I_{LOAD(max)}$ = Maximum Load Current (11)	$I_{LOAD(max)}$ = 1A (12)
$F$ = Switching Frequency (Fixed at a nominal 260 kHz). (13)	$F$ = Switching Frequency (Fixed at a nominal 260 kHz). (14)
<b>1. Programming Output Voltage</b> (Selecting $R_1$ and $R_2$ , as shown in <a href="#">Figure 23</a> )	<b>1. Programming Output Voltage</b> (Selecting $R_1$ and $R_2$ , as shown in <a href="#">Figure 23</a> )
Use the following formula to select the appropriate resistor values:	Select $R_1$ to be 1 k $\Omega$ , 1%. Solve for $R_2$ .
$V_{OUT} = V_{REF} \left( 1 + \frac{R_2}{R_1} \right)$ <p>where</p> <ul style="list-style-type: none"> <li><math>V_{REF} = 1.21V</math></li> </ul> (15)	$R_2 = R_1 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right) = 1 \text{ k}\Omega \left( \frac{20V}{1.23V} - 1 \right)$ (16)
Select a value for $R_1$ between 240 $\Omega$ and 1.5 k $\Omega$ . The lower resistor values minimize noise pickup in the sensitive feedback pin. (For the lowest temperature coefficient and the best stability with time, use 1% metal film resistors.)	$R_2 = 1k (16.53 - 1) = 15.53 \text{ k}\Omega$ , closest 1% value is 15.4 k $\Omega$ . $R_2 = 15.4 \text{ k}\Omega$ .
$R_2 = R_1 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right)$ (17)	
<b>2. Inductor Selection (L1)</b>	<b>2. Inductor Selection (L1)</b>
<b>A.</b> Calculate the inductor Volt • microsecond constant $E \cdot T$ ( $V \cdot \mu s$ ), from the following formula:	<b>A.</b> Calculate the inductor Volt • microsecond constant ( $E \cdot T$ ),
$E \cdot T = (V_{IN(MAX)} - V_{OUT} - V_{SAT}) \cdot \frac{V_{OUT} + V_D}{V_{IN(MAX)} - V_{SAT} + V_D} \cdot \frac{1000}{260} (V \cdot \mu s)$ (18)	$E \cdot T = (28 - 20 - 0.25) \cdot \frac{20 + 0.5}{28 - 0.25 + 0.5} \cdot \frac{1000}{260} (V \cdot \mu s)$ $E \cdot T = (7.75) \cdot \frac{20.5}{28.25} \cdot 3.85 (V \cdot \mu s) = 21.6 (V \cdot \mu s)$ <p>where</p> <ul style="list-style-type: none"> <li><math>V_{SAT}</math> = internal switch saturation voltage = 0.25V and</li> <li><math>V_D</math> = diode forward voltage drop = 0.5V</li> </ul> (19)
<b>B.</b> Use the $E \cdot T$ value from the previous formula and match it with the $E \cdot T$ number on the vertical axis of the Inductor Value Selection Guide shown in <a href="#">Figure 27</a> .	<b>B.</b> $E \cdot T = 21.6 (V \cdot \mu s)$
<b>C.</b> On the horizontal axis, select the maximum load current.	<b>C.</b> $I_{LOAD(max)} = 1A$
<b>D.</b> Identify the inductance region intersected by the $E \cdot T$ value and the Maximum Load Current value. Each region is identified by an inductance value and an inductor code (LXX).	<b>D.</b> From the inductor value selection guide shown in <a href="#">Figure 27</a> , the inductance region intersected by the 21.6 ( $V \cdot \mu s$ ) horizontal line and the 1A vertical line is 68 $\mu H$ , and the inductor code is L30.
<b>E.</b> Select an appropriate inductor from the four manufacturer's part numbers listed in <a href="#">Table 1</a> . For information on the different types of inductors, see the <a href="#">inductor selection</a> in the <a href="#">fixed output voltage design procedure</a> .	<b>E.</b> From the table in <a href="#">Table 1</a> , locate line L30, and select an inductor part number from the list of manufacturers part numbers.

PROCEDURE (Adjustable Output Voltage Version)	EXAMPLE (Adjustable Output Voltage Version)
<b>3. Output Capacitor Selection (C<sub>OUT</sub>)</b>	<b>3. Output Capacitor Selection (C<sub>OUT</sub>)</b>
<p><b>A.</b> Select an output capacitor from the capacitor code selection guide in <a href="#">Table 8</a>. Using the inductance value found in the <a href="#">inductor selection</a> guide, step 1, locate the appropriate capacitor code corresponding to the desired output voltage.</p>	<p><b>A.</b> Use the appropriate row of the capacitor code selection guide, in <a href="#">Table 8</a>. For this example, use the 15–20V row. The capacitor code corresponding to an inductance of 68 <math>\mu</math>H is C20.</p>
<p><b>B.</b> Select an appropriate capacitor value and voltage rating, using the capacitor code, from the output capacitor selection table in <a href="#">Table 9</a>. There are two solid tantalum (surface mount) capacitor manufacturers and four electrolytic (through hole) capacitor manufacturers to choose from. It is recommended that both the manufacturers and the manufacturer's series that are listed in the table be used. A table listing the manufacturers' phone numbers is located in <a href="#">Table 4</a>.</p>	<p><b>B.</b> From the output capacitor selection table in <a href="#">Table 9</a>, choose a capacitor value (and voltage rating) that intersects the capacitor code(s) selected in section A, C20. The capacitance and voltage rating values corresponding to the capacitor code C20 are the</p> <p>Surface Mount:          33 <math>\mu</math>F/25V Sprague 594D Series.          33 <math>\mu</math>F/25V AVX TPS Series.</p> <p>Through Hole:          33 <math>\mu</math>F/25V Sanyo OS-CON SC Series.          120 <math>\mu</math>F/35V Sanyo MV-GX Series.          120 <math>\mu</math>F/35V Nichicon PL Series.          120 <math>\mu</math>F/35V Panasonic HFQ Series.</p> <p>Other manufacturers or other types of capacitors may also be used, provided the capacitor specifications (especially the 100 kHz ESR) closely match the characteristics of the capacitors listed in the output capacitor table. Refer to the capacitor manufacturers' data sheet for this information.</p>
<b>4. Catch Diode Selection (D1)</b>	<b>4. Catch Diode Selection (D1)</b>
<p><b>A.</b> In normal operation, the average current of the catch diode is the load current times the catch diode duty cycle, 1-D (D is the switch duty cycle, which is approximately <math>V_{OUT}/V_{IN}</math>). The largest value of the catch diode average current occurs at the maximum input voltage (minimum D). For normal operation, the catch diode current rating must be at least 1.3 times greater than its maximum average current. However, if the power supply design must withstand a continuous output short, the diode should have a current rating greater than the maximum current limit of the LM2675EP. The most stressful condition for this diode is a shorted output condition.</p>	<p><b>A.</b> Refer to the table shown in <a href="#">Table 5</a>. Schottky diodes provide the best performance, and in this example a 1A, 40V Schottky diode would be a good choice. If the circuit must withstand a continuous shorted output, a higher current (at least 2.2A) Schottky diode is recommended.</p>
<p><b>B.</b> The reverse voltage rating of the diode should be at least 1.25 times the maximum input voltage.</p>	
<p><b>C.</b> Because of their fast switching speed and low forward voltage drop, Schottky diodes provide the best performance and efficiency. The Schottky diode must be located close to the LM2675EP using short leads and short printed circuit traces.</p>	
<b>5. Input Capacitor (C<sub>IN</sub>)</b>	<b>5. Input Capacitor (C<sub>IN</sub>)</b>
<p>A low ESR aluminum or tantalum bypass capacitor is needed between the input pin and ground to prevent large voltage transients from appearing at the input. This capacitor should be located close to the IC using short leads. In addition, the RMS current rating of the input capacitor should be selected to be at least <math>\frac{1}{2}</math> the DC load current. The capacitor manufacturer data sheet must be checked to assure that this current rating is not exceeded. The curves shown in <a href="#">Figure 28</a> show typical RMS current ratings for several different aluminum electrolytic capacitor values. A parallel connection of two or more capacitors may be required to increase the total minimum RMS current rating to suit the application requirements.</p> <p>For an aluminum electrolytic capacitor, the voltage rating should be at least 1.25 times the maximum input voltage. Caution must be exercised if solid tantalum capacitors are used. The tantalum capacitor voltage rating should be twice the maximum input voltage. The tables in <a href="#">Table 7</a> show the recommended application voltage for AVX TPS and Sprague 594D tantalum capacitors. It is also recommended that they be surge current tested by the manufacturer. The TPS series available from AVX, and the 593D and 594D series from Sprague are all surge current tested. Another approach to minimize the surge current stresses on the input capacitor is to add a small inductor in series with the input supply line. Use caution when using ceramic capacitors for input bypassing, because it may cause severe ringing at the <math>V_{IN}</math> pin.</p>	<p>The important parameters for the input capacitor are the input voltage rating and the RMS current rating. With a maximum input voltage of 28V, an aluminum electrolytic capacitor with a voltage rating of at least 35V (<math>1.25 \times V_{IN}</math>) would be needed. The RMS current rating requirement for the input capacitor in a buck regulator is approximately <math>\frac{1}{2}</math> the DC load current. In this example, with a 1A load, a capacitor with a RMS current rating of at least 500 mA is needed. The curves shown in <a href="#">Figure 28</a> can be used to select an appropriate input capacitor. From the curves, locate the 35V line and note which capacitor values have RMS current ratings greater than 500 mA.</p> <p>For a through hole design, a 330 <math>\mu</math>F/35V electrolytic capacitor (Panasonic HFQ series, Nichicon PL, Sanyo MV-GX series or equivalent) would be adequate. Other types or other manufacturers' capacitors can be used provided the RMS ripple current ratings are adequate. Additionally, for a complete surface mount design, electrolytic capacitors such as the Sanyo CV-C or CV-BS, and the Nichicon WF or UR and the NIC Components NACZ series could be considered.</p> <p>For surface mount designs, solid tantalum capacitors can be used, but caution must be exercised with regard to the capacitor surge current rating and voltage rating. In this example, checking <a href="#">Table 7</a>, and the Sprague 594D series datasheet, a Sprague 594D 15 <math>\mu</math>F, 50V capacitor is adequate.</p>

PROCEDURE (Adjustable Output Voltage Version)	EXAMPLE (Adjustable Output Voltage Version)
<b>6. Boost Capacitor (C<sub>B</sub>)</b>	<b>6. Boost Capacitor (C<sub>B</sub>)</b>
This capacitor develops the necessary voltage to turn the switch gate on fully. All applications should use a 0.01 $\mu$ F, 50V ceramic capacitor.	For this application, and all applications, use a 0.01 $\mu$ F, 50V ceramic capacitor.

(1) The SC series of Os-Con capacitors (others are SA series)

(2) The voltage ratings of the surface mount tantalum chip and Os-Con capacitors are too low to work at these voltages.

## APPLICATION INFORMATION

## TYPICAL SURFACE MOUNT PC BOARD LAYOUT, FIXED OUTPUT (4X SIZE)

$C_{IN}$  - 15  $\mu$ F, 50V, Solid Tantalum Sprague, "594D series"  
 $C_{OUT}$  - 68  $\mu$ F, 16V, Solid Tantalum Sprague, "594D series"  
 D1 - 1A, 40V Schottky Rectifier, Surface Mount  
 L1 - 33  $\mu$ H, L23, Coilcraft DO3316  
 $C_B$  - 0.01  $\mu$ F, 50V, Ceramic

Figure 29.

## TYPICAL SURFACE MOUNT PC BOARD LAYOUT, ADJUSTABLE OUTPUT (4X SIZE)

$C_{IN}$  - 15  $\mu$ F, 50V, Solid Tantalum Sprague, "594D series"  
 $C_{OUT}$  - 33  $\mu$ F, 25V, Solid Tantalum Sprague, "594D series"  
 D1 - 1A, 40V Schottky Rectifier, Surface Mount  
 L1 - 68  $\mu$ H, L30, Coilcraft DO3316  
 $C_B$  - 0.01  $\mu$ F, 50V, Ceramic  
 R1 - 1k, 1%  
 R2 - Use formula in Design Procedure

Figure 30. PC Board Layout

Layout is very important in switching regulator designs. Rapidly switching currents associated with wiring inductance can generate voltage transients which can cause problems. For minimal inductance and ground loops, the wires indicated by **heavy lines (in Figure 22 and Figure 23)** should be **wide printed circuit traces and should be kept as short as possible**. For best results, external components should be located as close to the switcher IC as possible using ground plane construction or single point grounding.

If **open core inductors are used**, special care must be taken as to the location and positioning of this type of inductor. Allowing the inductor flux to intersect sensitive feedback, IC ground path, and  $C_{OUT}$  wiring can cause problems.

When using the adjustable version, special care must be taken as to the location of the feedback resistors and the associated wiring. Physically locate both resistors near the IC, and route the wiring away from the inductor, especially an open core type of inductor.

### WSON PACKAGE DEVICES

The LM2675EP may be offered in the 16 lead WSON surface mount package to allow for increased power dissipation compared to the SOIC-8 and PDIP.

The Die Attach Pad (DAP) can and should be connected to PCB Ground plane/island. For CAD and assembly guidelines refer to Application Note AN-1187.

## REVISION HISTORY

Changes from Revision A (April 2013) to Revision B	Page
• Changed layout of National Data Sheet to TI format .....	<a href="#">25</a>

---

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
