

1 TMS320C6421 Fixed-Point Digital Signal Processor

1.1 Features

- **High-Performance Digital Signal Processor (C6421)**
 - 2.5-, 2-, 1.67-, 1.43- ns Instruction Cycle Time
 - 400-, 500-, 600-, 700-MHz C64x+™ Clock Rate
 - Eight 32-Bit C64x+ Instructions/Cycle
 - 3200, 4000, 4800, 5600 MIPS
 - Fully Software-Compatible With C64x
 - Commercial and Automotive (Q or S suffix) Grades
 - Low-Power Device (L suffix)
- **VelociTI.2™ Extensions to VelociTI™ Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core**
 - Eight Highly Independent Functional Units With VelociTI.2 Extensions:
 - Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
 - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
 - Load-Store Architecture With Non-Aligned Support
 - 64 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
 - Additional C64x+™ Enhancements
 - Protected Mode Operation
 - Exceptions Support for Error Detection and Program Redirection
 - Hardware Support for Modulo Loop Auto-Focus Module Operation
- **C64x+ Instruction Set Features**
 - Byte-Addressable (8-/16-/32-/64-Bit Data)
 - 8-Bit Overflow Protection
 - Bit-Field Extract, Set, Clear
 - Normalization, Saturation, Bit-Counting
 - VelociTI.2 Increased Orthogonality
 - C64x+ Extensions
 - Compact 16-bit Instructions
 - Additional Instructions to Support Complex Multiplies
- **C64x+ L1/L2 Memory Architecture**
 - 128K-Bit (16K-Byte) L1P Program RAM/Cache [Flexible Allocation]
 - 384K-Bit (48K-Byte) L1D Data RAM/Cache [Flexible Allocation]
 - 512K-Bit (64K-Byte) L2 Unified Mapped RAM/Cache [Flexible Allocation]
- **Endianess: Supports Both Little Endian and Big Endian**
- **External Memory Interfaces (EMIFs)**
 - 16-Bit DDR2 SDRAM Memory Controller With 128M-Byte Address Space (1.8-V I/O)
 - Supports up to 266-MHz (data rate) bus and interfaces to DDR2-400 SDRAM
 - Asynchronous 8-Bit-Wide EMIF (EMIFA) With up to 64M-Byte Address Reach
 - Flash Memory Interfaces
 - NOR (8-Bit-Wide Data)
 - NAND (8-Bit-Wide Data)
- **Enhanced Direct-Memory-Access (EDMA) Controller (64 Independent Channels)**
- **Two 64-Bit General-Purpose Timers (Each Configurable as Two 32-Bit Timers)**
- **One 64-Bit Watch Dog Timer**
- **One UART With RTS and CTS Flow Control**
- **Master/Slave Inter-Integrated Circuit (I²C Bus™)**
- **Multichannel Buffered Serial Port (McBSP0)**
 - I2S and TDM
 - AC97 Audio Codec Interface
 - SPI
 - Standard Voice Codec Interface (AIC12)
 - Telecom Interfaces – ST-Bus, H-100
 - 128 Channel Mode
- **Multichannel Audio Serial Port (McASP0)**
 - Four Serializers and SPDIF (DIT) Mode
- **16-Bit Host-Port Interface (HPI)**
- **10/100 Mb/s Ethernet MAC (EMAC)**
 - IEEE 802.3 Compliant
 - Supports Multiple Media Independent Interfaces (MII, RMII)
 - Management Data I/O (MDIO) Module

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this document.

All trademarks are the property of their respective owners.

- **VLYNQ™ Interface (FPGA Interface)**
- **Three Pulse Width Modulator (PWM) Outputs**
- **On-Chip ROM Bootloader**
- **Individual Power-Savings Modes**
- **Flexible PLL Clock Generators**
- **IEEE-1149.1 (JTAG™) Boundary-Scan-Compatible**
- **Up to 111 General-Purpose I/O (GPIO) Pins (Multiplexed With Other Device Functions)**
- **Packages:**
 - **361-Pin Pb-Free PBGA Package (ZWT Suffix), 0.8-mm Ball Pitch**
 - **376-Pin Plastic BGA Package (ZDU Suffix), 1.0-mm Ball Pitch**
- **0.09-μm/6-Level Cu Metal Process (CMOS)**
- **3.3-V and 1.8-V I/O, 1.2-V Internal (-7/-6/-5/-4/-Q6/-Q5/-Q4)**
- **3.3-V and 1.8-V I/O, 1.05-V Internal (-7/-6/-5/-4/-L/-Q5)**
- **Applications:**
 - **Telecom**
 - **Audio**
 - **Industrial Applications**

1.2 Description

The TMS320C64x+™ DSPs (including the TMS320C6421 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The C6421 device is based on the third-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for digital signal processor applications. The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform. The C64x™ DSPs support added functionality and have an expanded instruction set from previous devices.

Any reference to the C64x DSP or C64x CPU also applies, unless otherwise noted, to the C64x+ DSP and C64x+ CPU, respectively.

With performance of up to 5600 million instructions per second (MIPS) at a clock rate of 700 MHz, the C64x+ core offers solutions to high-performance DSP programming challenges. The DSP core possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. The C64x+ DSP core processor has 64 general-purpose registers of 32-bit word length and eight highly independent functional units—two multipliers for a 32-bit result and six arithmetic logic units (ALUs). The eight functional units include instructions to accelerate the performance in telecom, audio, and industrial applications. The DSP core can produce four 16-bit multiply-accumulates (MACs) per cycle for a total of 2800 million MACs per second (MMACS), or eight 8-bit MACs per cycle for a total of 5600 MMACS. For more details on the C64x+ DSP, see the *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number [SPRU732](#)).

The C6421 also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals similar to the other C6000 DSP platform devices. The C6421 core uses a two-level cache-based architecture. The Level 1 program memory/cache (L1P) consists of a 128K-bit memory space that can be configured as mapped memory or direct mapped cache, and the Level 1 data (L1D) consists of a 384K-bit memory space that can be configured as mapped memory or 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 512K-bit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two.

The peripheral set includes: a 10/100 Mb/s Ethernet MAC (EMAC) with a management data input/output (MDIO) module; a 4-bit transmit, 4-bit receive VLYNQ interface; an inter-integrated circuit (I2C) Bus interface; a multichannel buffered serial port (McBSP0); a multichannel audio serial port (McASP0) with 4 serializers; 2 64-bit general-purpose timers each configurable as 2 independent 32-bit timers; 1 64-bit watchdog timer; a user-configurable 16-bit host-port interface (HPI); up to 111-pins of general-purpose input/output (GPIO) with programmable interrupt/event generation modes, multiplexed with other peripherals; 1 UART with hardware handshaking support; 3 pulse width modulator (PWM) peripherals; and 2 glueless external memory interfaces: an asynchronous external memory interface (EMIFA) for slower memories/peripherals, and a higher speed synchronous memory interface for DDR2.

The Ethernet Media Access Controller (EMAC) provides an efficient interface between the C6421 and the network. The C6421 EMAC supports 10Base-T and 100Base-TX or 10 Mbits/second (Mbps) and 100 Mbps in either half- or full-duplex mode, with hardware flow control and quality of service (QOS) support.

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The I2C and VLYNQ ports allow C6421 to easily control peripheral devices and/or communicate with host processors.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections later in this document and the associated peripheral reference guides.

The C6421 has a complete set of development tools. These include C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

1.3 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the C6421 device.

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

This data manual revision history highlights the technical changes made to the SPRS346C device-specific data manual to make it an SPRS346D revision.

Scope: Applicable updates to the TMS320C642x, specifically relating to the TMS320C6421 device, have been incorporated.

- Added 700-MHz C64x+™ device speed.
- Added designators for low-power (-L) devices.

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Section 1.1	Added "5600 MIPS" to "High-Performance Digital Signal Processor (C6421)" bullet
Section 1.2	<ul style="list-style-type: none"> • In first paragraph, updated/changed the following: <ul style="list-style-type: none"> – First sentence from "With performance up to 4800 million instructions per second (MIPS) at a clock rate of 600 MHz..." to "With performance up to 5600 million instructions per second (MIPS) with a clock rate of 700 MHz..." – Fifth sentence from "The DSP core can produce...for a total of 2400 million MACs per second...or a total of 4800 MMACS." to "The DSP core can produce...for a total of 2800 million MACs per second...or a total of 5600 MMACS."
Section 2.7	Updated/Changed Figure 2-12 , <i>Device Nomenclature</i> , to reflect new device speeds and low-power designator (-L suffix).
Section 2.5	<p>Table 2-20, <i>Multichannel Audio Serial Port (McASP0) Terminal Functions</i>:</p> <ul style="list-style-type: none"> • Updated/Changed AFSR0/DR0/GP[100] pin description from "... frame synchronization AFSX0..." to "...frame synchronization AFSR0..." • Updated/Changed AFSX0/DX1/GP[107] pin description from "...frame synchronization AFSR0..." to "...frame synchronization AFSX0..."
Section 2.5	<p>Table 2-25, <i>Standalone GPIO 3.3 V Terminal Functions</i>:</p> <ul style="list-style-type: none"> • Added "Note: GP[xx] is only available when AEM = 0 or 5" to GP[36] through GP[43].
Section 3.7.3.1	<p>Table 3-19, <i>Multiplexed Pins on C6421</i>:</p> <ul style="list-style-type: none"> • Added "Note: GP[43:36] are only available when AEM = 0 or 5" to GP[36] through GP[43].
Section 5.3	Updated/Changed I _{CDD} and I _{DD} test conditions and footnote in Section 5.3 , <i>Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)</i> .
Section 5.2	Deleted "Future variants..." footnote from table
Section 6.7.1	<p>Table 6-15, <i>PLL1 Clock Frequency Ranges</i>:</p> <ul style="list-style-type: none"> • Updated/Changed PLLOUT 1.2V-CV_{DD} max value from "700 MHz" to "600 MHz" for -6/-5/-4/-Q6/-Q5/-Q4 devices. • Updated/Changed SYSCLK1 1.05V-CV_{DD} max value from "560 MHz" to "520 MHz" for -7 devices.
Section 6.7.1	Updated/Changed sentence from "TI requires EMI filter manufacturer Murata..." to "TI recommends EMI filter manufacturer Murata..."
Section 6.7.4	Deleted "(-4, -4Q, -4S, -5, -5Q, -5S, -6)" from Table 6-19 title, <i>Timing Requirements for MXI/CLKIN</i> .

2 Device Overview

2.1 Device Characteristics

Table 2-1, provides an overview of the TMS320C6421 DSP. The tables show significant features of the C6421 device, including the capacity of on-chip RAM, the peripherals, the CPU frequency, and the package type with pin count.

Table 2-1. Characteristics of the C6421 Processor

HARDWARE FEATURES		C6421
Peripherals Not all peripherals pins are available at the same time (For more detail, see the Device Configuration section).	DDR2 Memory Controller	(16-bit bus width) [1.8 V I/O]
	Asynchronous EMIF [EMIFA]	Asynchronous (8-bit bus width), RAM, Flash, (8-bit NOR or 8-bit NAND)
	EDMA3	1 (64 independent channels, 8 QDMA channels)
	Timers	2 64-bit General Purpose (configurable as 2 64-bit or 4 32-bit) 1 64-bit Watch Dog
	UART	1 with RTS and CTS flow control
	I2C	1 (Master/Slave)
	McBSP	1
	McASP	1 (4 serializers)
	10/100 Ethernet MAC (EMAC) with Management Data Input/Output (MDIO)	1

JTAG BSDL_ID	JTAGID register (address location: 0x01C4 0028)	See Section 6.21.1, JTAG Peripheral Register Description(s) – JTAG ID Register
CPU Frequency ⁽¹⁾	MHz	700 (-7, CV _{DD} = 1.2V) 600 (-6/-Q6, CV _{DD} = 1.2V) 500 (-5/-Q5, CV _{DD} = 1.2V) 400 (-4/-Q4, CV _{DD} = 1.2V) 400 (-L, CV _{DD} = 1.05V)
		1.43 (-7, CV _{DD} = 1.2V) 1.67 (-6/-Q6, CV _{DD} = 1.2V) 2 (-5/-Q5, CV _{DD} = 1.2V) 2.5 (-4/-Q4, CV _{DD} = 1.2V) 2.5 (-L, CV _{DD} = 1.05V)
Cycle Time ⁽¹⁾	ns	1.2 V (-7/ -6/-5/ -4/-Q6/-Q5/-Q4)
		1.05 V (-7/-6/-5/-4/-L/-Q5)
Voltage ⁽¹⁾	Core (V)	1.8 V, 3.3 V
	I/O (V)	
PLL Options	MXI/CLKIN frequency multiplier (15–30 MHz reference)	x1 (Bypass), x14 to x 32

(1) Applies to "tape and reel" part number counterparts as well. For more information, see [Section 2.7, Device and Development-Support Tool Nomenclature](#).

Table 2-1. Characteristics of the C6421 Processor (continued)

HARDWARE FEATURES		C6421
BGA Package(s)	16 x 16 mm, 0.8 mm pitch	361-Pin BGA (ZWT)
	23 x 23 mm, 1.0 mm pitch	376-Pin BGA (ZDU)
Process Technology	μm	0.09 μm
Product Status ⁽²⁾	Product Preview (PP), Advance Information (AI), or Production Data (PD)	PD

(2) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.2 C64x+ Megamodule

2.2.1 C64x+ Memory Architecture

The C64x+ Megamodule implements a two-level internal cache-based memory architecture with external memory support. The Level 1 Program memory/cache (L1P) consists of 16 KB memory space that can be configured as mapped memory or direct mapped cache. The Level 1 Data memory/cache (L1D) consists of 48 KB memory space which can be configured as mapped memory or 2-way set associated cache. The Level 2 memory/cache (L2) consists of a 64 KB memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or a combination of both.

Table 2-2 shows a memory map of the C64x+ CPU cache register for the device.

Figure 2-1, shows a diagram of the C64x+ Cache Memory Architecture.

Table 2-2. C64x+ Cache Registers

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION

0x0184 8200 - 0x0184 823C	MAR128 - MAR143	Memory Attribute Registers for DDR2 (corresponds to byte address 0x8000 0000 - 0x8FFF FFFF)
0x0184 8240 - 0x0184 83FC	MAR144 - MAR255	Reserved (corresponds to byte address 0x9000 0000 - 0xFFFF FFFF)

Figure 2-1. C64x+ Cache Memory Architecture

The L1P is divided into two regions—denoted as L1P Region 0 and L1P Region 1. This is the L1P architecture on the C6421:

- L1P Region 0: 0-KByte Memory
- L1P Region 1: 16-KByte Memory
 - L1P Region 1 can be configured as mapped memory or cache and has a 0 wait state latency. This region is shown as "L1P RAM/Cache" in [Table 2-5, Memory Map Summary](#).

The C6421 **does not** support memory protection on L1P.

The L1D is divided into two regions—denoted as L1D Region 0 and L1D Region 1. This is the L1D architecture on the C6421:

- L1D Region 0: 16-KByte Memory
 - This region is shown as "L1D RAM" in [Table 2-5, Memory Map Summary](#).
- L1D Region 1: 32-KByte Memory
 - L1D Region 1 can be configured as mapped memory or cache. This region is shown as "L1D RAM/Cache" in [Table 2-5, Memory Map Summary](#).

The C6421 **does not** support memory protection on L1D.

L2 memory implements two separate memory ports. This is the L2 architecture on the C6421:

- Port 0
 - This port is shown as "L2 RAM/Cache" in [Table 2-5, Memory Map Summary](#).
 - Banking Scheme: 2 x 128-bit banks
 - Latency: 1 cycle (0 wait state)
- Port 1
 - This port is shown as "Boot ROM" in [Table 2-5, Memory Map Summary](#).
 - Banking Scheme: 1 x 256-bit bank
 - Latency: 1 cycle (0 wait state)

The C6421 **does not** support memory protection on L2.

For more detailed information about the C64x+ Cache Memory Architecture, see the *TMS320C64x+ DSP Cache User's Guide* (literature number [SPRU862](#)) and the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number [SPRU871](#)).

2.2.1.1 L1P Configuration Register (L1PCFG) Description

The L1P Configuration Register (L1PCFG) controls/defines the size of the L1P cache. On the C6421, the L1PCFG register is device-specific and varies from what is shown in the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number SPRU871). The format and bit field descriptions of the L1PCFG register for the C6421 are shown in [Figure 2-2](#) and [Table 2-3](#), respectively.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset.

Figure 2-2. L1PCFG Register

Table 2-3. L1PCFG Register Bit Descriptions

Bit	Field Name	Description
31:3	RESERVED	Reserved. Read-only, writes have no effect.
2:0	L1PMODE	L1PMODE select. 000 [0h] = L1P Cache Disabled 001 [1h] = 4 KB 010 [2h] = 8 KB 011 [3h] = 16KB 100 [4h] – 111 [7h] = Reserved. Do Not Use. ⁽¹⁾

(1) For proper C6421 device operation, only settings 000 [0h] through 011 [3h] are valid. To initialize L1P RAM/Cache to a valid cache setting, the user **must** follow the sequence outlined in [Section 3.8, Device Initialization Sequence After Reset](#). For more details, see the *TMS320C6424/21 Digital Signal Processor (DSP) Silicon Errata [Silicon Revisions 1.1 and 1.0]* (literature number [SPRZ252](#)).

2.2.1.2 L1D Configuration Register (L1DCFG) Description

The L1D Configuration Register (L1DCFG) controls/defines the size of the L1D cache. The format and bit field descriptions of the L1DCFG register for the C6421 are shown in [Figure 2-3](#) and [Table 2-4](#), respectively.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset.

Figure 2-3. L1DCFG Register

Table 2-4. L1DCFG Register Bit Descriptions

Bit	Field Name	Description
31:3	RESERVED	Reserved. Read-only, writes have no effect.
2:0	L1DMODE	L1DMODE select. 000 [0h] = L1D Cache Disabled 001 [1h] = 4 KB 010 [2h] = 8 KB 011 [3h] = 16KB 100 [4h] = 32KB 101 [5h] = 32KB 110 [6h] = 32KB 111 [7h] = 32KB [default]

2.3 Memory Map Summary

Table 2-5 shows the memory map address ranges of the device. Table 2-6 depicts the expanded map of the Configuration Space (0x0180 0000 through 0x0FFF FFFF). The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

Table 2-5. Memory Map Summary

2.4 Pin Assignments

Extensive use of pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings. For more information on pin muxing, see [Section 3.7, Multiplexed Pin Configurations](#).

2.4.1 Pin Map (Bottom View)

Figure 2-4 through Figure 2-7 show the bottom view of the **ZWT** package pin assignments in four quadrants (A, B, C, and D). Figure 2-8 through Figure 2-11 show the bottom view of the **ZDU** package pin assignments in four quadrants (A, B, C, and D).

2.5 Terminal Functions

The terminal functions tables (Table 2-7 through Table 2-28) identify the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type, whether the pin has any internal pullup or pulldown resistors, and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pin, and debugging considerations, see the Device Configurations section of this data manual.

All device boot and configuration pins are multiplexed configuration pins— meaning they are multiplexed with functional pins. These pins function as device boot and configuration pins only during device reset. The input states of these pins are sampled and latched into the BOOTCFG register when device reset is deasserted (see **Note** below). After device reset is deasserted, the values on these multiplexed pins no longer have to hold the configuration.

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. Section 3.9.1, *Pullup/Pulldown Resistors* discusses situations where external pullup/pulldown resistors are required.

Note: Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together for the purpose of latching device boot and configuration pins. The values on all device boot and configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

Table 2-7. BOOT Terminal Functions

SIGNAL			TYPE (1)	OTHER (2)(3)	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
BOOT					
GP[25]/ (BOOTMODE3)	G16	H21	I/O/Z	IPD DV _{DD33}	Bootmode configuration bits. These bootmode functions along with the FASTBOOT function determine what device bootmode configuration is selected. The C6421 device supports several types of bootmodes along with a FASTBOOT option; for more details on the types/options, see Section 3.4.1, <i>Boot Modes</i> .
GP[24]/ (BOOTMODE2)	G15	L20			
GP[23]/ (BOOTMODE1)	F15	K20			
GP[22]/ (BOOTMODE0)	F18	J20			
GP[26]/ (FASTBOOT)	G17	K19	I/O/Z	IPD DV _{DD33}	Fast Boot 0 = Not Fast Boot 1 = Fast Boot
EM_A[4]/ GP[10]/ (PLLMS2)	A17	B21	I/O/Z	IPD DV _{DD33}	Fast Boot PLL Multiplier Select (PLLMS)
EM_A[1]/(ALE)/ GP[9]/ (PLLMS1)	A16	B20	I/O/Z	IPD DV _{DD33}	These pins select the PLL multiplier for Fast Boot. For more details, see Section 3.5.1.2, <i>Fast Boot PLL Multiplier Select (PLLMS)</i> .
EM_A[2]/(CLE)/ GP[8]/ (PLLMS0)	B16	A20	I/O/Z	IPD DV _{DD33}	

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-7. BOOT Terminal Functions (continued)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EM_A[0]/ GP[7]/(AEM2)	B17	C21	I/O/Z	IPD DV _{DD33}	Selects EMIFA Pinout Mode
EM_BA[0]/ GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV _{DD33}	The C6421 supports the following EMIFA Pinout Modes: AEM[2:0] = 000, No EMIFA AEM[2:0] = 010, EMIFA (Async) Pinout Mode 2 AEM[2:0] = 101, EMIFA (NAND) Pinout Mode 5
EM_BA[1]/ GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV _{DD33}	This signal doesn't actually affect the EMIFA module. It only affects how the EMIFA is pinned out.
RMTXD0/GP[28]	H16	J21	I/O/Z	IPD DV _{DD33}	For proper C6421 device operation, if this pin is both routed and 3-stated (not driven) during device reset, it must be pulled down via an external resistor. For more detailed information on pullup/pulldown resistors, see Section 3.9.1, Pullup/Pulldown Resistors .
RMTXD1/GP[27]/ (LENDIAN)	H17	L19	I/O/Z	IPU DV _{DD33}	Endian selection 0 = Big Endian 1 = Little Endian

Table 2-8. Oscillator/PLL Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
OSCILLATOR, PLL					
MXI/CLKIN	K19	N22	I	MXV _{DD}	Crystal input MXI for MX oscillator (system oscillator, typically 27 MHz). If the internal oscillator is bypassed, this is the external oscillator clock input. ⁽³⁾
MXO	J19	M22	O	MXV _{DD}	Crystal output for MX oscillator
MXV _{DD}	L18	N21	S	(4)	1.8 V power supply for MX oscillator. On the board, this pin can be connected to the same 1.8 V power supply as DV _{DDR2} .
MXV _{SS}	K18	M21	GND	(4)	Ground for MX oscillator
PLL _{PWR18}	L16	N20	S	(4)	1.8 V power supply for PLLs

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) Specifies the operating I/O supply voltage for each signal
- (3) For more information on external board connections, see , *External Clock Input From MXI/CLKIN Pin*.
- (4) For more information, see the *Recommended Operating Conditions* table.

Table 2-9. Clock Generator Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
CLOCK GENERATOR					
CLKOUT0/ PWM2/GP[84]	M1	R1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For the System Clock generator (PLL1), it is clock output CLKOUT0. This is configurable for toggling at the device input clock frequency (MXI/CLKIN frequency) or other divided-down (/1 to /32) clock outputs.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1](#), *Pullup/Pulldown Resistors*.
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-10. RESET and JTAG Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
RESET					
$\overline{\text{RESET}}$	M4	R3	I	IPU DV _{DD33}	Device reset

Table 2-12. EMIFA Terminal Functions (EMIFA Pinout Mode 2, AEM[2:0] = 010)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMIFA FUNCTIONAL PINS: 8-Bit ASYNC/NOR (EMIFA Pinout Mode 2, AEM[2:0] = 010)					
Actual pin functions are determined by the PINMUX0 and PINMUX1 register bit settings (e.g., AEM[2:0], etc.). For more details, see Section 3.7, Multiplexed Pin Configurations .					
$\overline{\text{EM_CS2}}$ / GP[12]	C19	C22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA, and GPIO. For EMIFA, this pin is Chip Select 2 output $\overline{\text{EM_CS2}}$ for use with asynchronous memories (i.e., NOR flash). This is the chip select for the default boot and ROM boot modes. Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_CS3}}$ / GP[13]	C18	D22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA, and GPIO. For EMIFA, this pin is Chip Select 3 output $\overline{\text{EM_CS3}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
RMRXD0/ $\overline{\text{EM_CS4}}$ / GP[32]	E19	H22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII), EMIFA, and GPIO. For EMIFA, it is Chip Select 4 output $\overline{\text{EM_CS4}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
RMRXD1/ $\overline{\text{EM_CS5}}$ / GP[33]	F19	J22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII), EMIFA, and GPIO. For EMIFA, it is Chip Select 5 output $\overline{\text{EM_CS5}}$ for use with asynchronous memories (i.e., NOR flash). Note: This pin features an internal pulldown (IPD). If this pin is connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor must be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.
$\overline{\text{EM_R}/\overline{\text{W}}}$ / GP[35]	D13	C17	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, it is read/write output $\overline{\text{EM_R}/\overline{\text{W}}}$.
$\overline{\text{EM_WAIT}}$ / (RDY/BSY)	E15	D20	I/O/Z	IPU DV _{DD33}	For EMIFA (ASYNC/NOR), this pin is wait state extension input $\overline{\text{EM_WAIT}}$.
$\overline{\text{EM_OE}}$	D15	D19	I/O/Z	IPU DV _{DD33}	For EMIFA, it is output enable output $\overline{\text{EM_OE}}$.
$\overline{\text{EM_WE}}$	E14	C19	I/O/Z	IPU DV _{DD33}	For EMIFA, it is write enable output $\overline{\text{EM_WE}}$.
$\overline{\text{EM_BA}}[0]$ / GP[6]/(AEM1)	C17	E20	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 0 output ($\overline{\text{EM_BA}}[0]$). When connected to an 8-bit asynchronous memory, this pin is the lowest order bit of the byte address.
$\overline{\text{EM_BA}}[1]$ / GP[5]/(AEM0)	C16	C20	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMIFA and GPIO. For EMIFA, this is the Bank Address 1 output $\overline{\text{EM_BA}}[1]$. When connected to an 8-bit asynchronous memory, this pin is the 2nd bit of the address.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-15. EMAC (MII/RMII) and MDIO Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
EMAC (MII)					
HCNTL1/MTXEN/ GP[75]	D3	C4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Enable output MTXEN.
HD15/MTXCLK/ GP[73]	A4	A4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Clock input MTXCLK.
HD9/MCOL/ GP[67]	C6	C6	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Collision Detect input MCOL.
HD11/MTXD3/ GP[69]	C5	A5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Data 3 output MTXD3.
HD12/MTXD2/ GP[70]	D5	C5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Data 2 output MTXD2.
HD13/MTXD1/ GP[71]	B4	B4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Data 1 output MTXD1.
HD14/MTXD0/ GP[72]	D4	B5	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Transmit Data 0 output MTXD0.
HR \overline{W} /MRXCLK/ GP[77]	A3	A3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Clock input MRXCLK.
HHWIL/MRXDV/ GP[74]	C4	D3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Data Valid input MRXDV.
HCNTL0/MRXER/ GP[76]	B3	B2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Error input MRXER.
HD10/MCRS/ GP[68]	B5	B6	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Carrier Sense input MCRS.
HINT/MRXD3/ GP[82]	C2	D2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Data 3 input MRXD3.
HRDY/MRXD2/ GP[80]	D2	C3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Data 2 input MRXD2.
HDS1/MRXD1/ GP[79]	B2	B3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive data 1 input MRXD1.
HDS2/MRXD0/ GP[78]	C3	C2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In Ethernet MAC (MII) mode, it is Receive Data 0 input MRXD0.
EMAC (RMII)					
RMCRSDV/GP[30]	G19	K22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC carrier sense/receive data valid (RMCRSDV) [1].
RMRXER/GP[52]	A15	A19	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC receive error (RMRXER) [1].
RMTXD1/GP[27]/ (LENDIAN)	H17	L19	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC transmit data pin 1 (RMTXD1) [O/Z].
RMTXD0/GP[28]	H16	J21	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC transmit data pin 0 (RMTXD0) [O/Z].
RMREFCLK/GP[31]	D19	G22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC RMII reference clock (RMREFCLK) [1].
RMTXEN/GP[29]	H15	K21	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII) and GPIO. In Ethernet MAC(RMII) mode, it is EMAC transmit enable (RMTXEN) [O/Z].

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-15. EMAC (MII/RMII) and MDIO Terminal Functions (continued)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION

RMRXD1/ $\overline{\text{EM_CS5}}$ / GP[33]	F19	J22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII), EMIFA, and GPIO. In Ethernet MAC(RMII) mode, it is EMAC receive data pin 1 (RMRXD1) [1].
RMRXD0/ $\overline{\text{EM_CS4}}$ / GP[32]	E19	H22	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between EMAC (RMII), EMIFA, and GPIO. In Ethernet MAC(RMII) mode, it is EMAC receive data pin 0 (RMRXD0) [1].
MDIO					
$\overline{\text{HCS}}$ /MDCLK/ GP[81]	C1	D1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In Ethernet MAC mode, it is Management Data Clock output MDCLK.
$\overline{\text{HAS}}$ /MDIO/ GP[83]	D1	C1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In Ethernet MAC mode, it is Management Data I/O MDIO (I/O/Z).

Table 2-16. VLYNQ Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
VLYNQ					
VLYNQ_CLOCK/ GP[57]	A7	A8	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between VLYNQ and GPIO. For VLYNQ, it is the clock VLYNQ_CLOCK (I/O/Z).
HD0/VLYNQ_SCRUN/ GP[58]	C8	B9	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is the Serial Clock run request VLYNQ_SCRUN (I/O/Z).
HD8/VLYNQ_TXD3/ GP[66]	A5	A6	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is transmit bus bit 3 output VLYNQ_TXD3.
HD7/VLYNQ_TXD2/ GP[65]	B6	B7	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is transmit bus bit 2 output VLYNQ_TXD2.
HD6/VLYNQ_TXD1/ GP[64]	D6	C7	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is transmit bus bit 1 output VLYNQ_TXD1.
HD5/VLYNQ_TXD0/ GP[63]	A6	A7	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is transmit bus bit 0 output VLYNQ_TXD0.
HD4/VLYNQ_RXD3/ GP[62]	C7	C8	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is receive bus bit 3 input VLYNQ_RXD3.
HD3/VLYNQ_RXD2/ GP[61]	B7	B8	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is receive bus bit 2 input VLYNQ_RXD2.
HD2/VLYNQ_RXD1/ GP[60]	A8	A9	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is receive bus bit 1 input VLYNQ_RXD1.
HD1/VLYNQ_RXD0/ GP[59]	D7	C9	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, VLYNQ, and GPIO. For VLYNQ, it is receive bus bit 0 input VLYNQ_RXD0.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-17. Host-Port Interface Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Host-Port Interface (HPI)					
HD0/VLYNQ_SCRUN/ GP[58]	C8	B9	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, VLYNQ or EMAC (MII), and GPIO. In HPI mode, these pins are host-port data pins HD[15:0] (I/O/Z) and are multiplexed internally with the HPI address lines.
HD1/VLYNQ_RXD0/ GP[59]	D7	C9			
HD2/VLYNQ_RXD1/ GP[60]	A8	A9			
HD3/VLYNQ_RXD2/ GP[61]	B7	B8			
HD4/VLYNQ_RXD3/ GP[62]	C7	C8			
HD5/VLYNQ_TXD0/ GP[63]	A6	A7			
HD6/VLYNQ_TXD1/ GP[64]	D6	C7			
HD7/VLYNQ_TXD2/ GP[65]	B6	B7			
HD8/VLYNQ_TXD3/ GP[66]	A5	A6			
HD9/MCOL/ GP[67]	C6	C6			
HD10/MCRS/ GP[68]	B5	B6			
HD11/MTXD3/ GP[69]	C5	A5			
HD12/MTXD2/ GP[70]	D5	C5			
HD13/MTXD1/ GP[71]	B4	B4			
HD14/MTXD0/ GP[72]	D4	B5			
HD15/MTXCLK/ GP[73]	A4	A4			
HHWIL/MRXDV/ GP[74]	C4	D3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is half-word identification input HHWIL (I).
HCNTL1/MTXEN/ GP[75]	D3	C4	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is control input 1 HCNTL1 (I). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the C6421.
HCNTL0/MRXER/ GP[76]	B3	B2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is control input 0 HCNTL0 (I). The state of HCNTL1 and HCNTL0 determines if address, data, or control information is being transmitted between an external host and the C6421.
HR/ \overline{W} /MRXCLK/ GP[77]	A3	A3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is host read or write select input HR/ \overline{W} (I).
HDS2/MRXD0/ GP[78]	C3	C2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is host data strobe input 2 HDS2 (I).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
(3) Specifies the operating I/O supply voltage for each signal

Table 2-17. Host-Port Interface Terminal Functions (continued)

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
$\overline{\text{HDS1}}/\text{MRXD1}/\text{GP}[79]$	B2	B3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is host data strobe input 1 $\overline{\text{HDS1}}$ (I).
$\overline{\text{HRDY}}/\text{MRXD2}/\text{GP}[80]$	D2	C3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is host ready output from DSP to host (O/Z).
$\overline{\text{HCS}}/\text{MDCLK}/\text{GP}[81]$	C1	D1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In HPI mode, this pin is HPI active low chip select input $\overline{\text{HCS}}$ (I).
$\overline{\text{HINT}}/\text{RXD3}/\text{GP}[82]$	C2	D2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, EMAC (MII), and GPIO. In HPI mode, this pin is host interrupt output $\overline{\text{HINT}}$ (O/Z).
$\overline{\text{HAS}}/\text{MDIO}/\text{GP}[83]$	D1	C1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between HPI, MDIO, and GPIO. In HPI mode, this pin is host address strobe $\overline{\text{HAS}}$ (I). For proper HPI operation, if this pin is routed out, it must be pulled up via an external resistor.

Table 2-18. I2C Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
I2C					
SCL	M2	N2	I/O/Z	DV _{DD33}	For I2C, this pin is I2C clock. In I2C master mode, this pin is an output. In I2C slave mode, this pin is an input. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor.
SDA	M3	P2	I/O/Z	DV _{DD33}	For I2C, this pin is the I2C bi-directional data signal. When the I2C module is used, for proper device operation, this pin must be pulled up via an external resistor.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-19. Multichannel Buffered Serial Port 0 (McBSP0) Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Multichannel Buffered Serial Port 0 (McBSP0)					
Pin Muxing Control: TBD					
CLKS0/TOUT0/ GP[97]	J4	L3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McBSP0, Timer0, and GPIO. For McBSP0, it is McBSP0 external clock source (I).
ACLKR0/CLKX0/ GP[99]	H1	J1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit clock CLKX0 (I/O/Z).
AHCLKR0/CLKR0/ GP[101]	J2	K1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive clock CLKR0 (I/O/Z).
AXR0[2]/FSX0/ GP[103]	H3	J2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 transmit frame synchronization FSX0 (I/O/Z).
AXR0[3]/FSR0/ GP[102]	G4	J3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 receive frame synchronization FSR0 (I/O/Z).
AXR0[1]/DX0/ GP[104]	J3	K2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data transmit output DX0 (O/Z).
AFSR0/DR0/ GP[100]	H4	K3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McBSP0, it is McBSP0 data receive input DR0 (I).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

(3) Specifies the operating I/O supply voltage for each signal

Table 2-20. Multichannel Audio Serial Port (McASP0) Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
McASP0					
AMUTEIN0/ GP[109]	F2	G3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute input AMUTEIN0 (I).
AMUTE0/ GP[110]	G3	H3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 mute output AMUTE0 (O/Z).
ACLKR0/CLKX0/ GP[99]	H1	J1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive bit clock ACLKR0 (I/O/Z).
AHCLKR0/CLKR0/ GP[101]	J2	K1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive high-frequency master clock AHCLKR0 (I/O/Z).
ACLKX0/ GP[106]	F1	G1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit bit clock ACLKX0 (I/O/Z).
AHCLKX0/ GP[108]	G1	H1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit high-frequency master clock AHCLKX0 (I/O/Z).
AFSR0/DR0/ GP[100]	H4	K3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 receive frame synchronization AFSR0 (I/O/Z).
AFSX0/ GP[107]	G2	G2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit frame synchronization AFSX0 (I/O/Z).
AXR0[3]/FSR0/ GP[102]	G4	J3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 3 AXR0[3] (I/O/Z).
AXR0[2]/FSX0/ GP[103]	H3	J2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 2 AXR0[2] (I/O/Z).
AXR0[1]/DX0/ GP[104]	J3	K2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0, McBSP0, and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 1 AXR0[1] (I/O/Z).
AXR0[0]/ GP[105]	H2	H2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between McASP0 and GPIO. For McASP0, it is McASP0 transmit/receive (TX/RX) data pin 0 AXR0[0] (I/O/Z).

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
(3) Specifies the operating I/O supply voltage for each signal

Table 2-21. UART0 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
UART0					
URXD0/ GP[85]	L2	M2	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. When used by UART0 this pin is the receive data input URXD0.
UTXD0/ GP[86]	K3	N1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between UART0 (Data) and GPIO. In UART0 mode, this pin is the transmit data output UTXD0.
UCTS0/ GP[87]	L1	P1	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control) and GPIO. In UART0 mode, this pin is the clear to send input UCTS0.
URTS0/ PWM0/ GP[88]	L3	M3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. In UART0 mode, this pin is the ready to send output URTS0.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pull-down, IPU = Internal pull-up. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1](#), *Pullup/Pulldown Resistors*.
(3) Specifies the operating I/O supply voltage for each signal

Table 2-22. PWM0, PWM1, and PWM2 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
PWM2					
CLKOUT0/PWM2/ GP[84]	M1	R1	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the System Clock generator (PLL1), PWM2, and GPIO. For PWM2, this pin is output PWM2.
PWM1					
GP[4]/PWM1	F3	F3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between GPIO and PWM1. For PWM1, this pin is output PWM1.
PWM0					
URTS0/PWM0/ GP[88]	L3	M3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the UART0 (Flow Control), PWM0, and GPIO. For PWM0, this pin is output PWM0.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
- (3) Specifies the operating I/O supply voltage for each signal

Table 2-23. Timer 0, Timer 1, and Timer 2 Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
Timer 2					
No external pins. The Timer 2 (watchdog) peripheral pins are not pinned out as external pins.					
Timer 1					
TINP1L/ GP[56]	L4	P3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the Timer 1 and GPIO. For Timer 1, this pin is the timer 1 input pin for the lower 32-bit counter
TOUT1L/ GP[55]	K4	N3	I/O/Z	IPU DV _{DD33}	This pin is multiplexed between the Timer 1 and GPIO. For Timer 1, this pin is the timer 1 output pin for the lower 32-bit counter
Timer 0					
TINP0L/ GP[98]	K2	L2	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the Timer 0 and GPIO. For Timer 0, this pin is the timer 0 input pin for the lower 32-bit counter
CLKS0/ TOUT0L/ GP[97]	J4	L3	I/O/Z	IPD DV _{DD33}	This pin is multiplexed between the McBSP0, Timer 0, and GPIO. For Timer 0, this pin is the timer 0 output pin for the lower 32-bit counter

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
(2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1, Pullup/Pulldown Resistors](#).
(3) Specifies the operating I/O supply voltage for each signal

Table 2-24. GPIO Terminal Functions

SIGNAL			TYPE ⁽¹⁾	OTHER ⁽²⁾⁽³⁾	DESCRIPTION
NAME	ZWT NO.	ZDU NO.			
GPIO					
92 out of 111 GPIO pins on the C6421 device are multiplexed with other peripherals pin functions (e.g., EMAC/MDIO, McASP0, McBSP0, Timer 0, Timer 1, UART0, PWM0, PWM1, PWM2, EMIFA, and the CLKOUT0 pin), see the peripheral-specific Terminal Functions tables for the GPIO multiplexing.					

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal
- (2) IPD = Internal pulldown, IPU = Internal pullup. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.9.1](#), *Pullup/Pulldown Resistors*.

2.6 Device Support

2.6.1 Development Support

TI offers an extensive line of development tools for the TMS320C642x platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320C642x-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools
Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any SoC application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports TMS320C642x multiprocessor system debug) EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C642x platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

2.7 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320C6421ZWTQ6**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications.
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
- TMS** Fully-qualified production device.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

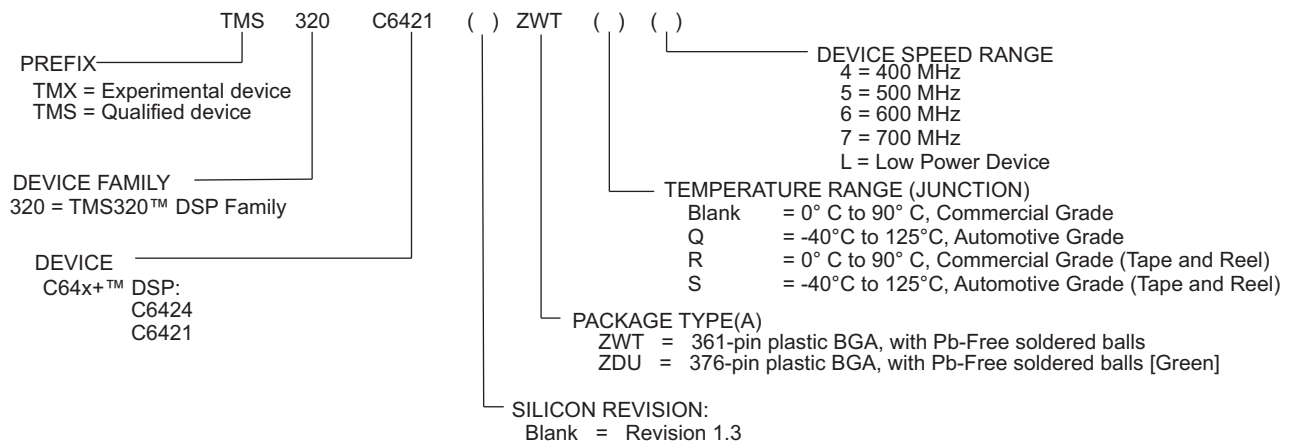

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZWT), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "Blank" is the default [600-MHz]).

Figure 2-12 provides a legend for reading the complete device name for any TMS320C642x DSP platform member.

- A. BGA = Ball Grid Array
- B. For "TMX" initial devices, the device number is C6424.
- C. Not all combinations are available. For more information, see the *Orderable Devices* table in the Packing Information section.
- D. The device speed range symbolization indicates the maximum CPU frequency at the highest CV_{DD} voltage supported. To determine the maximum CPU frequency at other supported CV_{DD} voltages, refer to the *PLL1 and PLL2* section.

Figure 2-12. Device Nomenclature

2.8 Documentation Support

2.8.1 Related Documentation From Texas Instruments

The following documents describe the TMS320C642x Fixed-Point Digital Signal Processor (DSP). Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the C642x DSP, related peripherals, and other technical collateral, is available in the C6000 DSP product folder at: www.ti.com/c6000.

[SPRUEM3](#) **TMS320C642x DSP Peripherals Overview Reference Guide.** Provides an overview and briefly describes the peripherals available on the TMS320C642x Digital Signal Processor (DSP).

[SPRAA84](#) **TMS320C64x to TMS320C64x+ CPU Migration Guide.** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

[SPRU732](#) **TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

[SPRU871](#) **TMS320C64x+ DSP Megamodule Reference Guide.** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

3 Device Configurations

3.1 System Module Registers

The system module includes status and control registers required for configuration of the device. Brief descriptions of the various registers are shown in [Table 3-1](#). System Module registers required for device configurations are discussed in the following sections.

Table 3-1. System Module Register Memory Map

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION
0x01C4 0000	PINMUX0	Pin Multiplexing Control 0 (see Section 3.7.2.1 , <i>PINMUX0 Register Description</i>).
0x01C4 0004	PINMUX1	Pin Multiplexing Control 1 (see Section 3.7.2.2 , <i>PINMUX1 Register Description</i>).
0x01C4 0008	DSPBOOTADDR	DSP Boot Address (see Section 3.4.2.3 , <i>DSPBOOTADDR Register</i>).
0x01C4 000C	BOOTCOMPLT	Boot Complete (see Section 3.4.2.2 , <i>BOOTCOMPLT Register</i>).
0x01C4 0010	–	Reserved
0x01C4 0014	BOOTCFG	Device Boot Configuration (see Section 3.4.2.1 , <i>BOOTCFG Register</i>).
0x01C4 0018 - 0x01C4 0027	–	Reserved
0x01C4 0028	JTAGID	JTAG ID (see Section 6.21.1 , <i>JTAG ID (JTAGID) Register Description(s)</i>).
0x01C4 002C	–	Reserved
0x01C4 0030	HPICTL	HPI Control (see Section 3.6.2.1 , <i>HPI Control Register</i>).
0x01C4 0034	–	Reserved

3.2 Power Considerations

The C6421 provides several means of managing power consumption.

As described in the [Section 6.3.4, C6421 Power and Clock Domains](#), the C6421 has one single power domain—the “Always On” power domain. Within this power domain, the C6421 utilizes local clock gating via the Power and Sleep Controller (PSC) to achieve power savings. For more details on the PSC, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320C642x Power and Sleep Controller (PSC) User’s Guide* (literature number [SPRUEN8](#)).

Some of the C6421 peripherals support additional power saving features. For more details on power saving features supported, see the *TMS320C642x Peripherals Overview Reference Guide* (literature number [SPRUEM3](#)).

Most C6421 3.3-V I/Os can be powered-down to reduce power consumption. The VDD3P3V_PWDN register in the System Module (see [Figure 3-1](#)) is used to selectively power down unused 3.3-V I/O pins. For independent control, the 3.3-V I/Os are separated into functional groups—most of which are named according to the pin multiplexing groups (see [Table 3-2](#)). For these I/O groups, only the I/O buffers needed for Host/EMIFA Boot or Power-Up Operations are powered up by default (CLKOUT Block, EMIFA Block, Host Block, and GPIO Block).

Note: To save power, all other I/O buffers are powered down by default. Before using these pins, the user **must** program the VDD3P3V_PWDN register to power up the corresponding I/O buffers.

For a list of multiplexed pins on the device and the pin mux group each pin belongs to, see [Section 3.7.3.1, Multiplexed Pins on C6421](#).

Note: The VDD3P3V_PWDN register *only* controls the power to the I/O buffers. The Power and Sleep Controller (PSC) determines the clock/power state of the peripheral.

Table 3-2. VDD3P3V_PWDN Register Descriptions

BIT	NAME	DESCRIPTION
31:14	RESERVED	Reserved. Read-only, writes have no effect.
13	RSV	Reserved. For proper device operation, this bit should be programmed to "1" during device initialization (see Section 3.8, Device Initialization Sequence After Reset).
12	EMBK3	EMIFA Sub-Block 3 I/O Power Down Control. Controls the power of the 8 I/O pins in the EMIFA Sub-Block 3. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
11	UR0FC	UART0 Flow Control Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Flow Control Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].

Table 3-2. VDD3P3V_PWDN Register Descriptions (continued)

BIT	NAME	DESCRIPTION
10	UR0DAT	UART0 Data Block I/O Power Down Control. Controls the power of the 2 I/O pins in the UART0 Data Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].
9	TIMER1	Timer1 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer1 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].
8	TIMER0	Timer0 Block I/O Power Down Control. Controls the power of the 2 I/O pins in the Timer0 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].
7	SP	Serial Port Block I/O Power Down Control. Controls the power of the 12 I/O pins in the Serial Port Block (Serial Port Sub-Block 0 and Serial Port Sub-Block 1). 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].
6	PWM1	PWM1 Block I/O Power Down Control. Controls the power of the 1 I/O pin in the PWM1 Block. 0 = I/O pins powered up. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z) [default].
5	GPIO	GPIO Block I/O Power Down Control. Controls the power of the 4 I/O pins in the GPIO Block: GP[3:0]. Note: GPIO Block contains standalone GPIO pins and is not a pin mux group. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
4	HOST	Host Block I/O Power Down Control. Controls the power of the 27 I/O pins in the Host Block. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
3	EMBK2	EMIFA Sub-Block 2 I/O Power Down Control. Controls the power of the 3 I/O pins in the EMIFA Sub-Block 2. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
2	EMBK1	EMIFA Sub-Block 1 I/O Power Down Control. Controls the power of the 29 I/O pins in the EMIFA Sub-Block 1. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
1	EMBK0	EMIFA Sub-Block 0 I/O Power Down Control. Controls the power of the 21 I/O pins in the EMIFA Sub-Block 0. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).
0	CLKOUT	CLKOUT Block I/O Power Down Control. Controls the power of the 1 I/O pin in the CLKOUT Block. 0 = I/O pins powered up [default]. 1 = I/O pins powered down and not operational. Outputs are 3-stated (Hi-Z).

3.3 Clock Considerations

Global device and local peripheral clocks are controlled by the PLL Controllers (PLL1 and PLL2) and the Power and Sleep Controller (PSC).

3.3.1 Clock Configurations after Device Reset

After device reset, the user is responsible for programming the PLL Controllers (PLL1 and PLL2) and the Power and Sleep Controller (PSC) to bring the device up to the desired clock frequency and the desired peripheral clock state (clock gating or not).

For additional power savings, some of the C6421 peripherals support clock gating within the peripheral boundary. For more details on clock gating and power saving features supported by a specific peripheral, see the *TMS320C642x Peripherals Overview Reference Guide* (literature number [SPRUEM3](#)).

3.3.1.1 Device Clock Frequency

The C6421 defaults to PLL bypass mode. To bring the device up to the desired clock frequency, the user should program PLL1 and PLL2 after device reset.

C6421 supports a FASTBOOT option, where upon exit from device reset the internal bootloader code automatically programs the PLL1 into PLL mode with a specific PLL multiplier and divider to speed up device boot. While the FASTBOOT option is beneficial for faster boot, the PLL multiplier and divider selected for boot *may not* be the exact frequency desired for the run-time application. It is the user's responsibility to reconfigure PLL1 after fastboot to bring the device into the desired clock frequency. [Section 3.4.1, Boot Modes](#), discusses the different fast boot modes in more detail.

The user **must** adhere to the various clock requirements when programming the PLL1 and PLL2:

- Fixed frequency ratio requirements between CLKDIV1, CLKDIV3, and CLKDIV6 clock domains. For more details on the frequency ratio requirements, see [Section 6.3.4, C6421 Power and Clock Domains](#).
- PLL multiplier and frequency ranges. For more details on PLL multiplier and frequency ranges, see [Section 6.7.1, PLL1 and PLL2](#).

3.3.1.2 Module Clock State

The clock and reset state for each of the modules is controlled by the Power and Sleep Controller (PSC). [Table 3-3](#) shows the default state of each module after a device-level global reset. The C6421 device has four different module states—Enable, Disable, SyncReset, or SwRstDisable. For more information on the definitions of the module states, the PSC, and PSC programming, see [Section 6.3.5, Power and Sleep Controller \(PSC\)](#) and the *TMS320C642x Power and Sleep Controller (PSC) User's Guide* (literature number [SPRUEN8](#)).

Table 3-3. C6421 Default Module States

LPSC #	MODULE NAME	DEFAULT MODULE STATE [PSC Register MDSTATn.STATE]
2	EDMACC	SwRstDisable
3	EDMATC0	SwRstDisable
4	EDMATC1	SwRstDisable
5	EDMATC2	SwRstDisable
6	EMAC Memory Controller	SwRstDisable
7	MDIO	SwRstDisable
8	EMAC	SwRstDisable
9	McASP0	SwRstDisable
11	VLYNQ	SwRstDisable
12	HPI	SwRstDisable
13	DDR2 Memory Contoller	SwRstDisable
14	EMIFA	SwRstDisable, if configuration pins AEM[2:0] = 000b Enable, if configuration pins AEM[2:0] = Others [010b and 101b]
16	McBSP0	SwRstDisable
18	I2C	SwRstDisable
19	UART0	SwRstDisable
23	PWM0	SwRstDisable
24	PWM1	SwRstDisable
25	PWM2	SwRstDisable
26	GPIO	SwRstDisable
27	TIMER0	SwRstDisable
28	TIMER1	SwRstDisable
39	C64x+ CPU	Enable

3.4 Boot Sequence

The boot sequence is a process by which the device's memory is loaded with program and data sections, and by which some of the device's internal registers are programmed with predetermined values. The boot sequence is started automatically after each device-level global reset. For more details on device-level global resets, see [Section 6.5, Reset](#).

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset. For more information on the bootmode selections, see [Section 3.4.1, Boot Modes](#).

The device is booted through multiple means—primary bootloaders within internal ROM or EMIFA, and secondary user bootloaders from peripherals or external memories. Boot modes, pin configurations, and register configurations required for booting the device, are described in the following subsections.

3.4.1 Boot Modes

The C6421 boot modes are determined by these device boot and configuration pins. For information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

- BOOTMODE[3:0]
- FASTBOOT
- PLLMS[2:0]

BOOTMODE[3:0] determines the type of boot (e.g., I2C Boot, EMIFA Boot, or HPI Boot, etc.). FASTBOOT determines if the PLL is enabled during boot to speed up the boot process.

PLLMS[2:0] is used by bootloader code to determine the PLL multiplier used during fastboot modes (FASTBOOT = 1).

The C6421 boot modes are grouped into two categories—Non-Fastboot Modes and User-Select Multiplier Fastboot Modes.

- **Non-Fastboot Modes (FASTBOOT = 0):** The device operates in default PLL bypass mode during boot. The Non-Fastboot bootmodes available on the C6421 are shown in [Table 3-4](#).
- **User-Select Multiplier Fastboot Modes (FASTBOOT = 1):** The bootloader code speeds up the device during boot. The PLL multiplier is selected by the user via the PLLMS[2:0] pins. The User-Select Multiplier Fastboot bootmodes available on the C6421 are shown in [Table 3-5](#).

All other modes *not* shown in these tables are reserved and invalid settings.

Table 3-4. Non-Fastboot Modes (FASTBOOT = 0)

DEVICE BOOT AND CONFIGURATION PINS	BOOT DESCRIPTION ⁽¹⁾	C6421 DSP (Master/Slave)	PLL1 CLOCK SETTING AT BOOT			DSPBOOTADDR (DEFAULT) ⁽¹⁾
			PLL MODE ⁽²⁾	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)	
BOOTMODE[3:0]						
0000	No Boot (Emulation Boot)	Master	Bypass	/1	CLKIN	0x0010 0000
0001	Reserved	–	–	–	–	–
0010	HPI Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
0011	Reserved	–	–	–	–	–
0100	EMIFA ROM Direct Boot [PLL Bypass Mode]	Master	Bypass	/1	CLKIN	0x4200 000
0101	I2C Boot [STANDARD MODE] ⁽³⁾	Master	Bypass	/1	CLKIN	0x0010 0000
0110	16-bit SPI Boot [McBSP0]	Master	Bypass	/1	CLKIN	0x0010 0000
0111	NAND Flash Boot	Master	Bypass	/1	CLKIN	0x0010 0000
1000	UART Boot without Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1001	Reserved	–	–	–	–	–
1010	VLYNQ Boot	Slave	Bypass	/1	CLKIN	0x0010 0000
1011	Reserved	–	–	–	–	–
1100	Reserved	–	–	–	–	–
1101	Reserved	–	–	–	–	–
1110	UART Boot with Hardware Flow Control [UART0]	Master	Bypass	/1	CLKIN	0x0010 0000
1111	24-bit SPI Boot (McBSP0 + GP[97])	Master	Bypass	/1	CLKIN	0x0010 0000

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot, BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).
- (2) The PLL MODE for Non-Fastboot Modes is fixed as shown in this table; therefore, the PLLMS[2:0] configuration pins have no effect on the PLL MODE.
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz and 30 MHz. I2C Boot is *not* available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-5. User-Select Multiplier Fastboot Modes (FASTBOOT = 1)

DEVICE BOOT AND CONFIGURATION PINS	BOOT DESCRIPTION ⁽¹⁾	C6421 DSP (Master/Slave)	PLL1 CLOCK SETTING AT BOOT			DSPBOOTADDR (DEFAULT) ⁽¹⁾
			PLL MODE ⁽²⁾	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)	
BOOTMODE[3:0]						
0000	No Boot (Emulation Boot)	Master	Bypass	/1	CLKIN	0x0010 0000
0001	Reserved	–	–	–	–	–
0010	HPI Boot	Slave	Table 3-6	/2	Table 3-6	0x0010 0000
0011	Reserved	–	–	–	–	–
0100	EMIFA ROM FASTBOOT with AIS	Master	Table 3-6	/2	Table 3-6	0x0010 0000

0110	16-bit SPI Boot [McBSP0]	Master	Table 3-6	/2	Table 3-6	0x0010 0000
0111	NAND Flash Boot	Master	Table 3-6	/2	Table 3-6	0x0010 0000
1000	UART Boot without Hardware Flow Control [UART0]	Master	Table 3-6	/2	Table 3-6	0x0010 0000
1001	EMIFA ROM FASTBOOT without AIS	Master	Table 3-6	/2	Table 3-6	–
1010	VLYNQ Boot	Slave	x20	/2	CLKIN x20 / 2	0x0010 0000
1011	Reserved	–	–	–	–	–
1100	Reserved	–	–	–	–	–
1101	Reserved	–	–	–	–	–
1110	UART Boot with Hardware Flow Control [UART0]	Master	Table 3-6	/2	Table 3-6	0x0010 0000
1111	24-bit SPI Boot (McBSP0 + GP[97])	Master	x20	/2	CLKIN x20 / 2	0x0010 0000

- (1) For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on the bootloader, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).
- (2) Any supported PLL MODE is available. [See Table 3-6 for supported C6421 PLL MODE options].
- (3) I2C Boot (BOOTMODE[3:0] = 0101b) is *only* available if the MXI/CLKIN frequency is between 21 MHz to 30 MHz. I2C Boot is *not* available for MXI/CLKIN frequencies less than 21 MHz.

Table 3-6. PLL Multiplier Selection (PLLMS[2:0]) in User-Select Multiplier Fastboot Modes (FASTBOOT = 1)

DEVICE BOOT AND CONFIGURATION PINS	PLL1 CLOCK SETTING AT BOOT		
PLLMS[2:0]	PLL MODE	CLKDIV1 DOMAIN (SYSCLK1 DIVIDER)	DEVICE FREQUENCY (SYSCLK1)
000	x20	/2	CLKIN x20 / 2
001	x15	/2	CLKIN x15 / 2
010	x16	/2	CLKIN x16 / 2
011	x18	/2	CLKIN x18 / 2
100	x22	/2	CLKIN x22 / 2
101	x25	/2	CLKIN x25 / 2
110	x27	/2	CLKIN x27 / 2
111	x30	/2	CLKIN x30 / 2

As shown in [Table 3-4](#) and [Table 3-5](#), at device reset the Boot Controller defaults the DSPBOOTADDR to one of two values based on the boot mode selected. In all boot modes, the C64x+ is immediately released from reset and begins executing from address location indicated in DSPBOOTADDR.

- **Internal Bootloader ROM (0x0010 0000):** For most boot modes, the DSPBOOTADDR defaults to the internal Bootloader ROM so that the DSP can immediately execute the bootloader code in the internal ROM. The bootloader code decodes the captured BOOTMODE, FASTBOOT, and PLLMS information (in the BOOTCFG register) to determine the proper boot operation.

Note: For all boot modes that default to DSPBOOTADDR = 0x0010 0000, the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM. If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).

- **EMIFA Chip Select Space 2 (0x4200 0000):** The EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0) is the **only** exception where the DSPBOOTADDR defaults to the EMIFA Chip Select Space 2. The DSP begins execution directly from the external ROM at this EMIFA space.

For more information how the bootloader code handles each boot mode, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).

3.4.1.1 FASTBOOT

When C6421 exits pin reset ($\overline{\text{RESET}}$ or $\overline{\text{POR}}$ released), the PLL Controllers (PLL1 and PLL2) default to PLL Bypass Mode. This means the PLLs are disabled, and the MXI/CLKIN clock input is driving the chip. All the clock domain divider ratios discussed in [Section 6.3.4, C6421 Power and Clock Domains](#), still apply. For example, assume an MXI/CLKIN frequency of 25 MHz—meaning the internal clock source for EMIFA is at CLKDIV3 domain = 25 MHz/3 = 8.3 MHz, a very slow clock. In addition, the EMIFA registers are reset to the slowest configuration which translates to very slow peripheral operation/boot.

To optimize boot time, the user should reprogram clock settings via the PLLC as early as possible during the boot process. The FASTBOOT pin facilitates this operation by allowing the device to boot at a faster clock rate.

Except for the EMIFA ROM Direct Boot in PLL Bypass Mode (BOOTCFG settings BOOTMODE[3:0] = 0100b, FASTBOOT = 0), all other boot modes default to executing from the Internal Bootloader ROM. The first action that the bootloader code takes is to decode the boot mode. If the FASTBOOT option is selected (BOOTCFG.FASTBOOT = 1), the bootloader software begins by programming the PLLC1 (System PLLC) to PLL Mode to give the device a slightly faster operation before fetching code from external devices. The exact PLL multiplier that the bootloader uses is determined by the PLLMS[2:0] settings, as shown in [Table 3-5](#) and [Table 3-6](#).

Some boot modes *must* be accompanied with FASTBOOT = 1 so that the corresponding peripheral can run at a reasonable rate to communicate to the external device(s).

Note: PLLC2 still stays in PLL Bypass Mode, the bootloader *does not* reconfigure it.

3.4.1.2 Selecting FASTBOOT PLL Multiplier

[Table 3-5](#) and [Table 3-6](#) show the PLL multipliers used by the bootloader code during fastboot (FASTBOOT = 1) and the resulting device frequency. The user is responsible for selecting the bootmode with the appropriate PLL multiplier for their MXI/CLKIN clock source so that the device speed and PLL frequency range requirements are met. For the PLLC1 Clock Frequency Ranges, see [Table 6-15, PLLC1 Clock Frequency Ranges](#) in [Section 6.7.1, PLL1 and PLL2](#).

The following are guidelines for PLL output frequency and device speed (frequency):

- **PLL Output Frequency:** (PLLOUT = CLKIN frequency * boot PLL Multiplier) **must** stay within the PLLOUT frequency range in [Table 6-15](#), *PLL1 Clock Frequency Ranges*.
- **Device Frequency:** (SYSCLK1) calculated from [Table 3-5](#) **must not** exceed the SYSCLK1 maximum frequency in [Table 6-15](#), *PLL1 Clock Frequency Ranges*.

For example, for a 600-MHz device with a CLKIN = 25 MHz, in order to stay within the PLLOUT frequency range and SYSCLK1 maximum frequency from [Table 6-15](#), *PLL1 Clock Frequency Ranges*, the user **must** select a boot mode with a PLL1 multiplier between x16 and x24.

3.4.1.3 EMIFA Boot Modes

As shown in [Table 3-4](#) and [Table 3-5](#), there are different types of EMIFA Boot Modes. This subsection summarizes these types of EMIFA boot modes. For further detailed information, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).

- **EMIFA ROM Direct Boot in PLL Bypass Mode** (FASTBOOT = 0, BOOTMODE[3:0] = 0100b)
 - The C64x+ fetches the code directly from EMIFA Chip Select 2 Space [$\overline{EM_CS2}$] (address 0x4200 0000)
 - The PLL is in Bypass Mode
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0]. AEM[2:0] **must** be configured to 010b [EMIFA (Async) Pinout Mode 2].
- **EMIFA ROM Fastboot with AIS** (FASTBOOT = 1, BOOTMODE[3:0] = 0100b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the PLLMS[2:0] configuration as shown in [Table 3-5](#).
 - The bootloader code reads code from the EMIFA $\overline{EM_CS2}$ space using the application image script (AIS) format.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0]. AEM[2:0] **must** be configured to 010b [EMIFA (Async) Pinout Mode 2].
- **EMIFA ROM Fastboot without AIS:** (FASTBOOT = 1, BOOTMODE[3:0] = 1001b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - The bootloader code programs PLLC1 to PLL Mode to speed up the boot process. The PLL multiplier value is determined by the PLLMS[2:0] configuration as shown in [Table 3-5](#).
 - The bootloader code then jumps to the EMIFA $\overline{EM_CS2}$ space, at which point the C64x+ fetches the code directly from address 0x4200 0000.
 - EMIFA is configured as Asynchronous EMIF. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0]. AEM[2:0] **must** be configured to 010b [EMIFA (Async) Pinout Mode 2].
- **NAND Flash Boot:** (FASTBOOT = 0 or 1, BOOTMODE[3:0] = 0111b)
 - The C64x+ begins execution from the internal bootloader ROM at address 0x0010 0000.
 - Depending on the FASTBOOT and PLLMS[2:0] settings, the bootloader code may program the PLLC1 to PLL Mode to speed up the boot process. See [Table 3-4](#) and [Table 3-5](#).
 - The bootloader code reads the code from EMIFA (NAND) $\overline{EM_CS2}$ (address 0x4200 0000) using AIS format.
 - EMIFA is configured in NAND mode. The user is responsible for ensuring the desirable Asynchronous EMIF pins are available through configuration pins AEM[2:0]. AEM[2:0] **can** be configured to 010b [EMIFA (Async) Pinout Mode 2] or 101b [EMIFA (NAND) Pinout Mode 5].

3.4.1.4 Serial Boot Modes (I2C, UART[UART0], SPI[McBSP0])

This subsection discusses how the bootloader configures the clock dividers for the serial boot modes—I2C boot, UART boot, and SPI boot.

3.4.1.4.1 I2C Boot

If FASTBOOT = 0, then I2C Boot (BOOTMODE = 0101) is performed in Standard-Mode (up-to 100 kbps). If FASTBOOT = 1, then I2C Boot is performed in Fast-Mode (up-to 400 kbps). The actual I2C data transfer rate is dependent on the MXI/CLKIN frequency.

This is how the bootloader programs the I2C:

- I2C Boot in Fast-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 1)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 8₁₀, ICCKH.ICCH = 8₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 78 * 1000
 - SCL low pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 39 / (CLKIN frequency in MHz)
- I2C Boot in Standard-Mode (BOOTMODE[3:0] = 0101b, FASTBOOT = 0)
 - I2C register settings: ICPSC.IPSC = 2₁₀, ICCLKL.ICCL = 45₁₀, ICCKH.ICCH = 45₁₀
 - Resulting in the following I2C prescaled module clock frequency (internal I2C clock):
 - (CLKIN frequency in MHz) / 3
 - Resulting in the following I2C serial clock (SCL):
 - SCL frequency (in kHz) = (CLKIN frequency in MHz) / 300 * 1000
 - SCL low pulse duration (in μs) = 150 / (CLKIN frequency in MHz)
 - SCL high pulse duration (in μs) = 150 / (CLKIN frequency in MHz)

Note: the I2C peripheral requires that the prescaled module clock frequency *must* be between 7 to 12 MHz. Therefore, the I2C boot is *only* available for MXI/CLKIN frequency between 21 MHz and 30 MHz.

For more details on the I2C peripheral configurations and clock requirements, see the *TMS320C642x Inter-Integrated Circuit (I2C) Peripheral User's Guide* (literature number [SPRUEN0](#)).

3.4.1.4.2 UART Boot

For UART Boot (BOOTMODE[3:0] = 1000b or 1110b), the bootloader programs the UART0 peripheral as follows:

- UART0 divisor is set to 15₁₀
- Resulting in this UART0 baud rate in kilobit per second (kbps):
 - (CLKIN frequency in MHz) * 1000 / (15 * 16)

The user is responsible for ensuring the resulting baud rate is appropriate for the system. The UART0 divisor (/15) is optimized for CLKIN frequency between 27 to 29 MHz to stay within 5% of the 115200-bps baud rate.

For more details on the UART peripheral configurations and clock generation, see the *TMS320C642x Universal Asynchronous Receiver/Transmitter (UART) User's Guide* (literature number [SPRUEN6](#)).

3.4.1.4.3 SPI Boot

Both 16-bit address SPI Boot (BOOTMODE = 0110) and 24-bit address SPI boot are performed through the McBSP0 peripheral. The bootloader programs the McBSP0 peripheral as follows:

- McBSP0 register settings: SRGR.CLKGDV = 2₁₀
- Resulting in this SPI serial clock frequency:
 - (SYSCLK3 frequency in MHz) / 3

SYSCLK3 frequency = SYSCLK1 frequency / 6. SYSCLK1 frequency during boot can be found in [Table 3-4](#), [Table 3-5](#), and/or [Table 3-6](#) based on the boot mode selection.

For example, if $BOOTMODE[3:0] = 0110b$, $FASTBOOT = 1$, the MXI/CLKIN frequency = 30 MHz, $PLLMS[2:0] = 100b$, the combination of [Table 3-5](#) and [Table 3-6](#) indicates that the device frequency (SYSCLK1) is $CLKIN \times 22 / 2 = 330$ MHz. This means SYSCLK3 frequency is $330 / 6 = 55$ MHz, resulting in SPI serial clock frequency of $55 / 3 = 18.3$ MHz.

3.4.1.5 Host Boot Modes

The C6421 supports HPI Boot.

The HPI Boot is available in fastboot and non-fastboot, as shown in [Table 3-4](#) and [Table 3-5](#).

Note: The HPI $\overline{HSTROBE}$ inactive pulse duration timing requirement [$t_{w(HSTBH)}$] is dependent on the HPI internal clock source (SYSCLK3) frequency (see [Section 6.12.3, HPI Electrical Data/Timing](#)). The external host **must** be aware of the SYSCLK3 frequency during boot to ensure the $\overline{HSTROBE}$ pulse duration timing requirement is met.

3.4.2 Bootmode Registers

3.4.2.1 BOOTCFG Register

The Device Bootmode (see [Section 3.4.1, Boot Modes](#)) and Configuration pins (see [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#)) latched at reset are captured in the Device Boot Configuration (BOOTCFG) register which is accessible through the System Module. This is a *read-only* register. The bits show the values latched from the corresponding configuration pins sampled at device reset. For more information on how these pins are sampled at device reset, see [Section 6.5.1.2, Latching Boot and Configuration Pins](#). For the corresponding device boot and configuration pins, see [Table 2-7, BOOT Terminal Functions](#).

											21	20	19	18	17	16

Figure 3-2. BOOTCFG Register—0x01C4 0014

Table 3-7. BOOTCFG Register Description

Bit	Field Name	Description
31:21	RESERVED	Reserved. Writes have no effect.
20	LENDIAN	Little Endian Selection (see Section 3.5.1.3, Endianess Selection (LENDIAN)) This field determines the device endian mode. 0 = Device is Big Endian 1 = Device is Little Endian The default value is latched from LENDIAN configuration pin.
19	FASTBOOT	Fastboot (see Section 3.4.1.1, FASTBOOT) This field is used by the device bootloader code to determine if it needs to speed up the device to PLL mode before booting. 0 = No Fastboot 1 = Fastboot The default value is latched from FASTBOOT configuration pin.
18:15	RESERVED	Reserved. Writes have no effect.

Table 3-7. BOOTCFG Register Description (continued)

Bit	Field Name	Description
14:12	PLLMS	Fastboot PLL Multiplier Select [PLLMS] (see Section 3.5.1.2, Fast Boot PLL Multiplier Select [PLLMS]) If FASTBOOT = 1, this field selects the FASTBOOT PLL Multiplier according to Table 3-6 . The default value is latched from the PLLMS[2:0] configuration pins.
11	RSV	Reserved. Writes have no effect.
10:8	DAEM	PINMUX0.AEM default [DAEM] (see Section 3.5.1.1, EMIFA Pinout Mode (AEM[2:0])) For more details on the AEM settings, see Section 3.7.2.1, PINMUX0 Register Description . This field affects pin mux control by setting the default of PINMUX0.AEM. This field <i>does not</i> affect EMIFA Register settings. The default value is latched from the AEM[2:0] configuration pins.
7:4	RESERVED	Reserved. Writes have no effect.
3:0	BOOTMODE	Boot Mode (see Section 3.4.1, Boot Modes) This field is used in conjunction with FASTBOOT and PLLMS to determine the device boot mode. The default value is latched from the BOOTMODE[3:0] configuration pins.

3.4.2.2 BOOTCMPLT Register

If the bootloader code detects an error during boot, it records the error status in the Boot Complete (BOOTCMPLT) register.

In addition, the BOOTCMPLT register is used for communication between the external host and the bootloader code during a Host Boot (HPI Boot). Once the external host has completed boot, it **must** perform the following communication with the bootloader code:

- Write the desired 32-bit CPU starting address in the DSPBOOTADDR register (see [Section 3.4.2.3, DSPBOOTADDR Register](#)).
- Write a '1' to the Boot Complete (BC) bit field in the BOOTCMPLT register to indicate that the host has completed booting this device.

Once the bootloader code detects BC = 1, it directs the CPU to begin executing from the DSPBOOTADDR register.

The BOOTCMPLT register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5, Reset](#).

31	RESERVED	20	ERR	19	ERR	16
	R/W-0000 0000 0000		R/W-0000		R/W-0000	
15	RESERVED	1	BC	0		
	R/W- 0000 0000 0000 000		R/W-0			

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-3. BOOTCMPLT Register— 0x01C4 000C

Table 3-8. BOOTCMPLT Register Description

Bit	Field Name	Description
31:20	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits.
19:16	ERR	Boot Error 0000 = No Error (default). 0001 - 1111 = bootloader software detected a boot error and aborted the boot. For the error codes, see the <i>Using the TMS320C642x Bootloader Application Report</i> (literature number SPRAAK5).
15:1	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits.
0	BC	Boot Complete Flag from Host This field is <i>only</i> applicable to Host Boots. 0 = Host <i>has not</i> completed booting this device (default). 1 = Host <i>has</i> completed booting this device. DSP can begin executing from the DSPBOOTADDR register value.

3.4.2.3 DSPBOOTADDR Register

The DSP Boot Address (DSPBOOTADDR) register contains the starting address for the C64x+ CPU. Whenever the C64x+ is released from reset, it begins executing from the location pointed to by DSPBOOTADDR register. For Host boots (HPI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot.

The DSPBOOTADDR register is reset by any device-level global reset. For the list of device-level global resets, see [Section 6.5, Reset](#).

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-4. DSPBOOTADDR Register— 0x01C4 0008

Table 3-9. DSPBOOTADDR Register Description

Bit	Field Name	Description
31:0	DSPBOOTADDR	DSP Boot Address After boot, the C64x+ CPU begins execution from this 32-bit address location 0x00100000 (for Internal Bootloader ROM). <i>or</i> 0x42000000 (for EMIFA $\overline{CS2}$ Space). The lower 10 bits (bits 9:0) should <i>always</i> be programmed to "0" as they are ignored by the C64x+. Default depends on boot mode selected. See Table 3-4, Non-Fastboot Modes and Table 3-5, User-Select Multiplier Fastboot Modes .

At device reset, the Boot Controller defaults DSPBOOTADDR to one of two values (either Internal Bootloader ROM at address 0x00100000 or EMIFA $\overline{CS2}$ Space 0x42000000) based on the boot mode selected (for the boot mode selections, see [Table 3-4](#) and [Table 3-5](#)).

For Non-Host Boot Modes, software can leave the DSPBOOTADDR register at default.

For Host Boots (HPI Boot), the DSPBOOTADDR register is also used for communication between the Host and the bootloader code during boot. For Host Boots, the DSPBOOTADDR register defaults to Internal Bootloader ROM, and the C64x+ CPU is immediately released from reset so that it can begin executing the bootloader code in this internal ROM. The bootloader code waits for the Host to boot the device. Once the Host is done booting the device, it **must** write a new starting address into the DSPBOOTADDR register, and follow with writing BOOTCMPLT.BC = 1 to indicate the boot is complete. As soon as the bootloader code detects BOOTCMPLT.BC = 1, it instructs the CPU to jump to this new DSPBOOTADDR address. At this point, the CPU continues the rest of the code execution starting from the new DSPBOOTADDR location and the boot is completed.

3.5 Configurations At Reset

Some device configurations are determined at reset. The following subsections give more details.

3.5.1 Device and Peripheral Configurations at Device Reset

Table 2-7, BOOT Terminal Functions, lists the device boot and configuration pins that are latched at device reset for configuring basic device settings for proper device operation. Table 3-10 summarizes the device boot and configuration pins, and the device functions that they affect.

Table 3-10. Default Functions Affected by Device Boot and Configuration Pins

DEVICE BOOT AND CONFIGURATION PINS	BOOT SELECTED	PIN MUX CONTROL	GLOBAL SETTING	PERIPHERAL SETTING
BOOTMODE[3:0]	Boot Mode	PINMUX0/PINMUX1 Registers: Based on BOOTMODE[3:0], the bootloader code programs PINMUX0 and PINMUX1 registers to select the appropriate pin functions required for boot.	I/O Pin Power: Based on BOOTMODE[3:0], the bootloader code programs VDD3P3V_PWDN register to power up the I/O pins required for boot.	PSC/Peripherals: Based on BOOTMODE[3:0], the bootloader code programs the PSC to put boot-related peripheral(s) in the Enable State, and programs the peripheral(s) for boot operation.
FASTBOOT	Fastboot	–	Sets Device Frequency: Based on BOOTMODE, FASTBOOT, and PLLMS; the bootloader code programs PLLC1.	–
PLLMS[2:0]	If FASTBOOT = 1, the PLLMS[2:0] selects the FASTBOOT PLL Multiplier.	–	Sets Device Frequency: Based on BOOTMODE, FASTBOOT, and PLLMS; the bootloader code programs PLLC1.	–
AEM[2:0]	–	PINMUX0.AEM: Sets the default of this field to control the EMIFA Pinout Mode. Affects the pin muxing in EMIFA Sub-Block 0, 1, and 3.	–	PSC/EMIFA: The EMIFA module state defaults to SwRstDisable if AEM = 0; otherwise, the EMIFA module state defaults to Enable.
LENDIAN	–	–	Device endianness	–

For proper device operation, external pullup/pulldown resistors may be required on these device boot and configuration pins. For discussion situations where external pullup/pulldown resistors are required, see Section 3.9.1, *Pullup/Pulldown Resistors*.

Note: The C6421 configuration inputs (BOOTMODE[3:0], FASTBOOT, PLLMS[2:0], AEM[2:0], and LENDIAN) are multiplexed with other functional pins. These pins function as device boot and configuration

pins only during device reset. The user **must** take care of any potential data contention in the system. To help avoid system data contention, the C6421 puts these configuration pins into a high-impedance state (Hi-Z) when device reset (RESET or POR) is asserted, and continues to hold them in a high-impedance state until the internal global reset is removed; at which point, the default peripheral (either GPIO or EMIFA based on default of AEM[2:0]) will now control these pins.

All of the device boot and configuration pin settings are captured in the corresponding bit fields in the BOOTCFG register (see [Section 3.4.2.1](#), *BOOTCFG Register*).

The following subsections provide more details on the device configurations determined at device reset: AEM, PLLMS, and LENDIAN.

3.5.1.1 EMIFA Pinout Mode (AEM[2:0])

To support different usage scenarios, the C6421 provides intricate pin multiplexing between the EMIFA and other peripherals. The PINMUX0.AEM register bit field in the System Module determines the EMIFA Pinout Mode. The AEM[2:0] pins only select the default EMIFA Pinout Mode. It is latched at device reset de-assertion (high) into the BOOTCFG.DAEM bit field. The AEM[2:0] value also sets the default of the PINMUX0.AEM bit field. While the BOOTCFG.DAEM bit field shows the actual latched value and *cannot* be modified, the PINMUX0.AEM value can be changed by software to modify the EMIFA Pinout Mode.

Note: The AEM[2:0] value *does not* affect the operation of the EMIFA module itself. It *only* affects which EMIFA pins are brought out to the device pins. For more details on the AEM settings, see [Section 3.7](#), *Multiplexed Pin Configurations*.

3.5.1.2 FASTBOOT PLL Multiplier Select (PLLMS)

If FASTBOOT = 1, the PLLMS[2:0] pins select PLL multiplier for Fastboot modes. If FASTBOOT = 0, the PLLMS[2:0] pins are ignored.

The PLLMS[2:0] pin values are latched at device reset de-assertion into the BOOTCFG.PLLMS field and cannot be modified by software. This value is only applicable during fast boot.

For more information on boot modes and the FASTBOOT PLL multiplier selection, see [Section 3.4.1](#), *Boot Modes*.

3.5.1.3 Endianess Selection (LENDIAN)

The LENDIAN configuration pin latched at reset determines the endianess setting of the device. If LENDIAN = 1, little endian is selected. If LENDIAN = 0, big endian is selected.

The setting is latched and stored in the BOOTCFG.LENDIAN field and cannot be modified by software.

3.6 Configurations After Reset

The following sections provide details on configuring the device after reset.

Multiplexed pins are configured both at and after reset. [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#), discusses multiplexed pin control at reset. For more details on multiplexed pins control after reset, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.1 Switch Central Resource (SCR) Bus Priorities

Prioritization within the Switched Central Resource (SCR) is programmable for each master. The register bit fields and default priority levels for C6421 bus masters are shown in [Table 3-11, C6421 Default Bus Master Priorities](#). The priority levels should be tuned to obtain the best system performance for a particular application. Lower values indicate higher priority. For most masters, their priority values are programmed at the system level by configuring the MSTPRI0 and MSTPRI1 registers. Details on the MSTPRI0/1 registers are shown in [Figure 3-5](#) and [Figure 3-6](#). The C64x+ and EDMA masters contain registers that control their own priority values.

Table 3-11. C6421 Default Bus Master Priorities

Priority Bit Field	Bus Master	Default Priority Level
EDMATC0P	EDMATC0	0 (EDMACC QUEPRI Register)
EDMATC1P	EDMATC1	0 (EDMACC QUEPRI Register)
EDMATC2P	EDMATC2	0 (EDMACC QUEPRI Register)
C64X+_DMAP	C64X+ (DMA)	7 (C64x + MDMAARBE.PRI field)
C64X+_CFGP	C64X+ (CFG)	1 (MSTPRI0 Register)

18:16	VLYNQP	VLYNQ master port priority in System Infrastructure. 000 = Priority 0 (Highest) 100 = Priority 4 001 = Priority 1 101 = Priority 5 010 = Priority 2 110 = Priority 6 011 = Priority 3 111 = Priority 7 (Lowest)
15:3	RESERVED	Reserved. Read-only, writes have no effect.
2:0	EMACP	EMAC master port priority in System Infrastructure. 000 = Priority 0 (Highest) 100 = Priority 4 001 = Priority 1 101 = Priority 5 010 = Priority 2 110 = Priority 6 011 = Priority 3 111 = Priority 7 (Lowest)

3.6.2 Peripheral Selection After Device Reset

After device reset, most peripheral configurations are done within the peripheral’s registers. This section discusses some additional peripheral controls in the System Module. For information on multiplexed pin controls that determine what peripheral pins are brought out to the pins, see [Section 3.7, Multiplexed Pin Configurations](#).

3.6.2.1 HPI Control Register (HPICTL)

The HPI Control (HPICTL) register determines the Host Burst Write Time-Out value. **The user should only modify this register once during device initialization. When modifying this register, the user must ensure the HPI FIFOs are empty and there are no on-going HPI transactions.**

Figure 3-7. HPICTL Register— 0x01C4 0030

Table 3-14. HPICTL Register Description

Bit	Field Name	Description
31:10	RESERVED	Reserved. Read-only, writes have no effect.
9:8	RESERVED	Reserved. For proper device operation, the user should <i>only</i> write "0" to these bits (default).
7:0	TIMOUT	Host Burst Write Timeout Value When the HPI time-out counter reaches the value programmed here, the HPI write FIFO content is flushed. For more details on the time-out counter and its use in write bursting, see the <i>TMS320C642x Host Port Interface (HPI) User's Guide</i> (literature number SPRUJEM9).

3.6.2.2 Timer Control Register (TIMERCTL)

The Timer Control Register (TIMERCTL) provides additional control for Timer0 and Timer2. **The user should only modify this register once during device initialization, when the corresponding Timer is not in use.**

- Timer 2 Control: The TIMERCTL.WDRST bit determines if the WatchDog timer event (Timer 2) can cause a device max reset. For more details on the description of a maximum reset, see [Section 6.5.3, Maximum Reset](#).
- Timer 0 Control: The TINP0SEL bit selects the clock source connected to Timer0's TIN0 input.

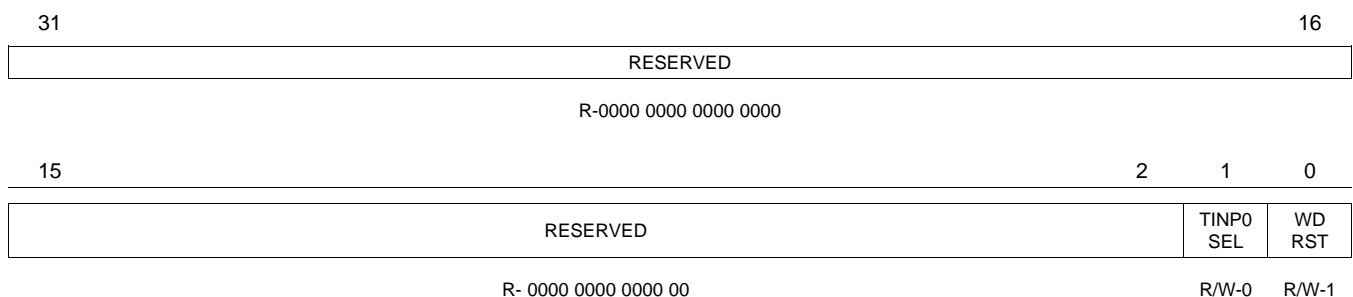

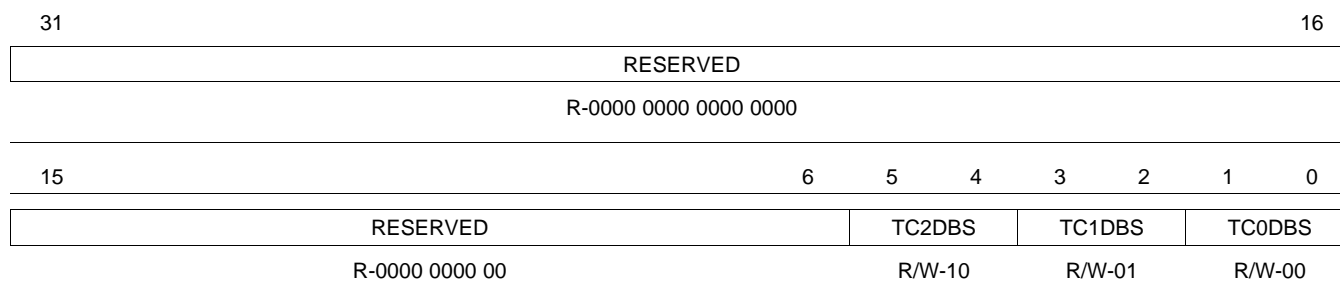

Figure 3-8. TIMERCTL Register— 0x01C4 0084

Table 3-15. TIMERCTL Register Description

Bit	Field Name	Description
31:2	RESERVED	Reserved. Read-Only, writes have no effect.
1	TINP0SEL	Timer0 External Input (TIN0) Select 0 = Timer0 external input comes directly from the TINP0L pin (default). 1 = Timer0 external input is TINP0L pin divided by 6. For example, if TINP0L = 25MHz, Timer0 input TIN0 is 25MHz / 6 = 4.2 MHz.
0	WDRST	WatchDog Reset Enable 0 = WatchDog Timer Event (WDINT from Timer2) does not cause device reset. 1 = WatchDog Timer Event (WDINT from Timer2) causes a device max reset (default).

3.6.2.3 EDMA TC Configuration Register (EDMATCCFG)

The EDMA Transfer Controller Configuration (EDMATCCFG) register configures the default burst size (DBS) for EDMA TC0, EDMA TC1, and EDMA TC2. For more information on the correct usage of DBS, see the *TMS320C642x Enhanced Direct Memory Access (EDMA) Controller User's Guide* (literature number [SPRUEM5](#)). **The user should only modify this register once during device initialization and when the corresponding EDMA TC is not in use.**

LEGEND: R = Read; W = Write; -n = value after reset

Figure 3-9. EDMA TC Configuration Register— 0x01C4 0088

Table 3-16. EDMA TC Configuration Register Description

Bit	Field	Description
31:6	RESERVED	Reserved. Read-Only, writes have no effect.
5:4	TC2DBS	EDMA TC2 Default Burst Size 00 = 16 byte 01 = 32 byte 10 = 64 byte (default) 11 = reserved EDMA TC2 is intended for miscellaneous transfers. TC2 FIFO size is 128 bytes, regardless of Default Burst Size setting.
3:2	TC1DBS	EDMA TC1 Default Burst Size 00 = 16 byte 01 = 32 byte (default) 10 = 64 byte 11 = reserved EDMA TC1 is intended for high throughput bulk transfers. TC1 FIFO size is 256 bytes, regardless of Default Burst Size setting.
1:0	TC0DBS	EDMA TC0 Default Burst Size 00 = 16 byte (default) 01 = 32 byte 10 = 64 byte 11 = reserved EDMA TC0 is intended for short burst transfers with stringent deadlines (e.g., McBSP, McASP). TC0 FIFO size is 128 bytes, regardless of Default Burst Size setting.

3.7 Multiplexed Pin Configurations

C6421 makes extensive use of pin multiplexing to accommodate a large number of peripheral functions in the smallest possible package, providing ultimate flexibility for end applications.

The Pin Multiplex Registers PINMUX0 and PINMUX1 in the System Module are responsible for controlling all pin multiplexing functions on the C6421. The default setting of some of the PINMUX0 and PINMUX1 bit fields are configured by configuration pins latched at reset (see [Section 3.5.1, Device and Peripheral Configurations at Device Reset](#)). After reset, software may program the PINMUX0 and PINMUX1 registers to switch pin functionalities.

The following peripherals have multiplexed pins: EMIFA, HPI, VLYNQ, EMAC, McASP0, McBSP0, PWM0, PWM1, PWM2, Timer0, Timer1, UART0, and GPIO.

The device is divided into the following Pin Multiplexed Blocks (Pin Mux Blocks):

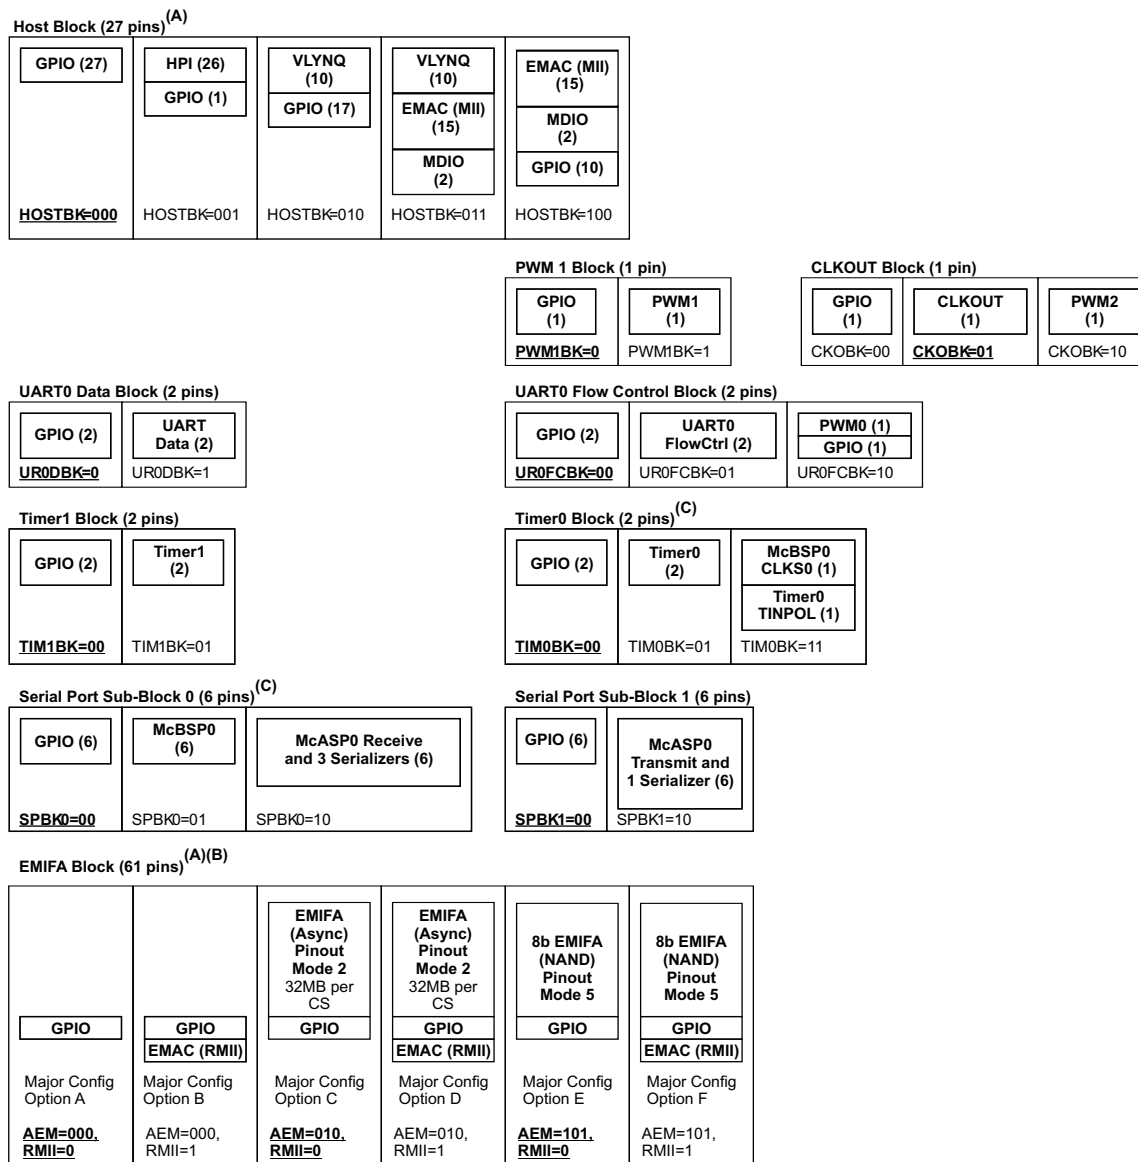

- **EMIFA Block:** EMIFA and GPIO. This block is further subdivided into these sub-blocks:
 - **Sub-Block 0:** part of EMIFA (address and control), part of EMAC(RMII), and GPIO
 - **Sub-Block 1:** part of EMIFA (data, address, control), part of EMAC(RMII), and GPIO
 - **Sub-Block 2:** part of EMIFA (control signals EM_WAIT/(RDY/BSY), EM_OE, and EM_WE)
 - **Sub-Block 3:** part of EMIFA (address EM_A[12:5]) and GPIO
- **Host Block:** HPI, VLYNQ, EMAC(MII), and GPIO
- **Serial Port Block:** McBSP0, McASP0, and GPIO. This block is further sub-divided into sub-blocks.
 - **Serial Port Sub-Block 0:** McBSP0, part of McASP0, and GPIO
 - **Serial Port Sub-Block 1:** part of McASP0 and GPIO
- **UART0 Flow Control Block:** UART0 flow control, PWM0, and GPIO
- **UART0 Data Block:** UART0 data and GPIO
- **Timer0 Block:** Timer0 and McBSP0 CLKS pins
- **Timer1 Block:** Timer1 and GPIO
- **PWM1 Block:** PWM1 and GPIO
- **CLKOUT Block:** CLKOUT0, PWM2, and GPIO

As shown in the list above, the McBSP0, UART0, and EMAC peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all relevant Pin Mux Blocks. For more details, see [Section 3.7.3, Pin Multiplexing Details](#), and [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

Note: There is no actual pin multiplexing in EMIFA Sub-Block 2. However it is still considered a "pin mux block" because it contains part of the pins necessary for EMIFA.

A high level view of the Pin Mux Blocks is shown in [Figure 3-10](#). In each Pin Mux Block, the PINMUX0/PINMUX1 default settings are underlined.

Note: Some default pin functions are determined by configuration pins (AEM[2:0]); therefore, more than one configuration setting can serve as default based on the configuration pin settings latched at device reset.

- Default settings for PINMUX0 and PINMUX1 registers are underlined.
- EMIFA Block: This figure only shows the Major Config Options in the EMIFA Block based on the AEM and RMII settings. Actual pin functions in the EMIFA Block are further determined by other PINMUX fields.
- McBSP0 pins span multiple blocks (Serial Port Sub-Block0 and Timer0 Block). Serial Port Sub-Block0 contains most of the pins needed for McBSP0 operation. Timer0 Block contains the optional external clock source input CLKS0.

Figure 3-10. Pin Mux Block Selection

3.7.1 Pin Muxing Selection At Reset

This section summarizes pin mux selection at reset.

The configuration pins AEM[2:0] latched at device reset determine default pin muxing for the following Pin Mux Blocks:

- EMIFA Block: default pin mux determined by AEM[2:0] and RMII. **After reset, software may modify settings in the PINMUX0 register to fine tune pin muxing in this block.**
 - AEM[2:0] = 000b, RMII = 0: Major Config Option A is selected. This block defaults to 58 GPIO pins.
 - AEM[2:0] = 000b, RMII = 1: Major Config Option B is selected. This block defaults to EMAC(RMII), plus 50 GPIO pins.
 - AEM[2:0] = 010b, RMII = 0: Major Config Option C is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 2, plus 13-to-16 GPIO pins.
 - AEM[2:0] = 010b, RMII = 1: Major Config Option D is selected. This block defaults to 8-bit EMIFA (Async) Pinout Mode 2, EMAC(RMII), plus 7-to-8 GPIO pins.
 - AEM[2:0] = 101b, RMII = 0: Major Config Option E is selected. This block defaults to 8-bit EMIFA (NAND) Pinout Mode 5, plus 44-to-47 GPIO pins.
 - AEM[2:0] = 101b, RMII = 1: Major Config Option F is selected. This block defaults to 8-bit EMIFA (NAND) Pinout Mode 5, EMAC(RMII), and 38-to-39 GPIO pins.

For a description of the PINMUX0 and PINMUX1 registers and more details on pin muxing, see [Section 3.7.2](#).

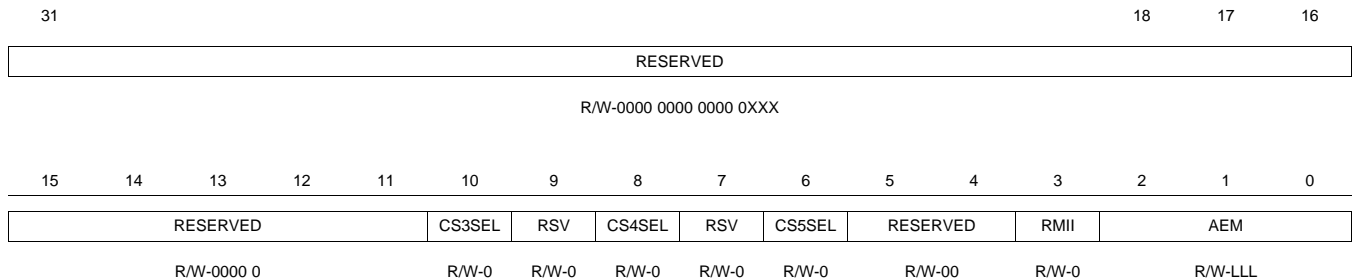

3.7.2 Pin Muxing Selection After Reset

The PINMUX0 and PINMUX1 registers in the System Module allow software to select the pin functions in the Pin Mux Blocks. The pin control of some of the Pin Mux Blocks requires a combination of PINMUX0/PINMUX1 bit fields. For more details on the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on C6421](#).

This section only provides an overview of the PINMUX0 and PINMUX1 registers. For more detailed discussion on how to program each Pin Mux Block, see [Section 3.7.3, Pin Multiplexing Details](#).

3.7.2.1 PINMUX0 Register Description

The Pin Multiplexing 0 Register (PINMUX0) controls the pin function in the EMIFA Block. The PINMUX0 register format is shown in [Figure 3-11](#) and the bit field descriptions are given in [Table 3-17](#). Some muxed pins are controlled by more than one PINMUX bit field. For the combination of the PINMUX bit fields that control each muxed pin, see [Section 3.7.3.1, Multiplexed Pins on C6421](#). For more information on EMIFA Block pin muxing, see [Section 3.7.3.11, EMIFA Block Muxing](#). For the pin-by-pin muxing control of the EMIFA Block, see [Section 3.7.3.11.2, EMIFA Block Pin-By-Pin Multiplexing Summary](#).

LEGEND: R/W = Read/Write; R = Read only; L = pin state latched at reset rising edge; -n = value after reset

⁽¹⁾ For proper C6421 device operation, **always** write a value of "0" to all RESERVED/RSV bits.

⁽²⁾ PINMUX0 bits 18:16 are reserved/ don't care. These bits may default to non-zero values.

Figure 3-11. PINMUX0 Register—0x01C4 0000 ⁽¹⁾ ⁽²⁾

Table 3-17. PINMUX0 Register Bit Descriptions

Bit	Field Name	Description	Pins Controlled
31:11	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
10	CS3SEL	Chip Select 3 Select. 0 = GPIO pin GP[13] (default) 1 = EMIFA Chip Select 3 ($\overline{\text{EM_CS3}}$)	Sub-Block 1 $\overline{\text{EM_CS3}}/\text{GP}[13]$ The PINMUX0 field CS3SEL alone controls the muxing of this pin.
9	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
8	CS4SEL	Chip Select 4 Select. 0 = GPIO pin GP[32] (default) or RMII RMRXD0. Pin function determined by PINMUX0.RMII. 1 = EMIFA Chip Select 4 ($\overline{\text{EM_CS4}}$). PINMUX0.RMII must be set to 0.	Sub-Block 1 $\text{RMRXD0}/\overline{\text{EM_CS4}}/\text{GP}[32]$ The combination of PINMUX0 fields CS4SEL and RMII controls the muxing of this pin.
7	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
6	CS5SEL	Chip Select 5 Select. 0 = GPIO pin GP[33] (default) or RMII RMRXD1. Pin function determined by PINMUX0.RMII. 1 = EMIFA Chip Select 5 ($\overline{\text{EM_CS5}}$). PINMUX0.RMII must be set to 0.	Sub-Block 1 $\text{RMRXD1}/\overline{\text{EM_CS5}}/\text{GP}[33]$ The combination of PINMUX0 fields CS5SEL and RMII controls the muxing of this pin.
5:4	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (default).	
3	RMII	RMII Select. 0 = No RMII in EMIFA Block Field CS5SEL determines function of pin $\overline{\text{EM_CS5}}$. Field CS4SEL determines function of pin $\overline{\text{EM_CS4}}$. The remaining 6 pins function as GP[52] and GP[31:27]. 1 = RMII in EMIFA Block These 8 pins function as RMII pins: RMRXER, RMRXD1, RMRXD0, REFCLK, RMCRSVDV, RMTXEN, RMTXD0, and RMTXD1. When EMAC (RMII) is selected, EMAC(MII) must not be selected. PINMUX1.HOSTBK must not be set to 011b or 100b. CS4SEL and CS5SEL must be programmed to 0. If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX0.RMII or PINMUX1.HOSTBK to select EMAC pins.	$\text{RMRXER}/\text{GP}[52]$ $\text{RMRXD1}/\overline{\text{EM_CS5}}/\text{GP}[33]$ $\text{RMRXD0}/\overline{\text{EM_CS4}}/\text{GP}[32]$ $\text{REFCLK}/\text{GP}[31]$ $\text{RMCRSVDV}/\text{GP}[30]$ $\text{RMTXEN}/\text{GP}[29]$ $\text{RMTXD0}/\text{GP}[28]$ $\text{RMTXD1}/\text{GP}[27]$ The pin mux for these pins are controlled by a combination of PINMUX0 fields RMII, CS4SEL, and CS5SEL.

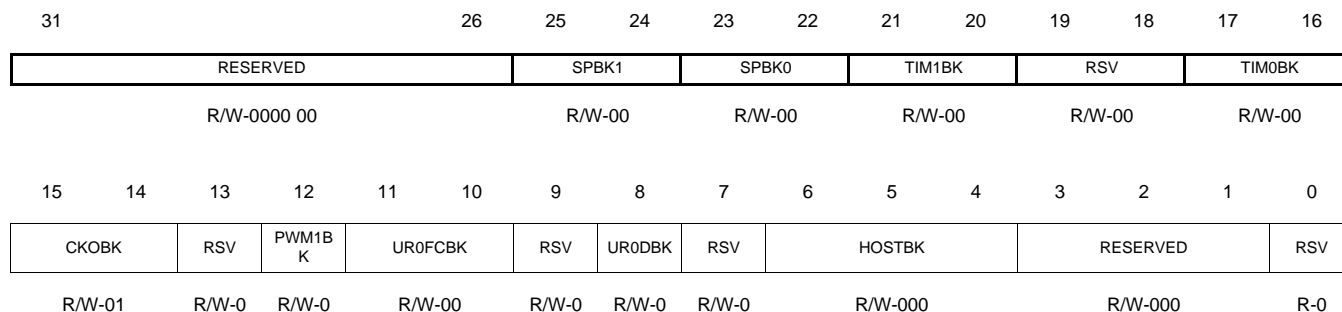

Table 3-17. PINMUX0 Register Bit Descriptions (continued)

Bit	Field Name	Description	Pins Controlled

For the full set of valid configurations of these pins, see Section 3.7.3.1.2, EMIFA Block Pin-by-Pin Multiplexing Summary.</p>

(1) The AEM default value is latched at reset from AEM[2:0] configuration inputs. The latched values are also shown at BOOTCFG.DAEM (read-only).

3.7.2.2 PINMUX1 Register Description

The Pin Multiplexing 1 Register (PINMUX1) controls the pin multiplexing of all Pin Mux Blocks. The PINMUX1 register format is shown in Figure 3-12 and the bit field descriptions are given in Table 3-18. Some muxed pins are controlled by more than one PINMUX bit field. For the combination of PINMUX bit fields that control each muxed pin, see Section 3.7.3.1, *Multiplexed Pins on C6421*.

LEGEND: R/W = Read/Write; R = Read only; P = specified pin state; -n = value after reset

(1) For proper C6421 device operation, *always* write a value of "0" to all RESERVED/RSV bits.

Table 3-18. PINMUX1 Register Description

Bit	Field Name	Description	Pins Controlled
31:26	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
25:24	SPBK1	Serial Port Sub-Block 1 Pin Select. Selects the function of the multiplexed pins in the Serial Port Sub-Block 1. 00 = GPIO Mode (default). Pins function as GPIO (GP[110:105]). 01 = Reserved. 10 = McASP0 Transmit and 1 serializer. Pins function as McASP0: AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0, and AMUTE0. 11 = Reserved.	Serial Port Sub-Block 1: AXR0[0]/GP[105] ACLKX0/GP[106] AFSX0/GP[107] AHCLKX0/GP[108] AMUTEIN0/GP[109] AMUTE0/GP[110]
23:22	SPBK0	Serial Port Sub-Block 0 Pin Select. Selects the function of the multiplexed pins in the Serial Port Sub-Block 0. 00 = GPIO Mode (default). Pins function as GPIO (GP[104:99]). 01 = McBSP0 Mode. Pins function as McBSP0 CLKX0, FSX0, DX0, CLKR0, FSR0, and DR0. 10 = McASP0 Receive and 3 serializers. Pins function as McASP0 ACLKR0, AFSR0, AHCLKR0, AXR0[3], AXR0[2], and AXR0[1]. 11 = Reserved	Serial Port Sub-Block 0: ACLKR0/CLKX0/GP[99] AFSR0/DR0/GP[100] AHCLKR0/CLKR0/GP[101] AXR0[3]/FSR0/GP[102] AXR0[2]/FSX0/GP[103] AXR0[1]/DX0/GP[104]
21:20	TIM1BK	Timer1 Block Pin Select. Selects the function of the multiplexed pins in the Timer1 Block. 00 = GPIO Mode (default). Pins function as GPIO (GP[56:55]). 01 = Timer1 Mode. Pins function as Timer1 TINP1L and TOUT1L. 10 = Reserved. 11 = Reserved.	Timer1 Block: TINP1L/GP[56] TOUT1L/GP[55]
19:18	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
17:16	TIM0BK	Timer0 Block Pin Select. Selects the function of the multiplexed pins in the Timer0 Block. 00 = GPIO Mode (default). Pins function as GPIO (GP[98:97]). 01 = Timer0 Mode. Pins function as Timer0 TINP0L and TOUT0L. 10 = Reserved 11 = McBSP0 External Clock Source + Timer0 Input Mode. Pins function as McBSP0 external clock source CLKS0, and Timer0 input TINP0L.	Timer0 Block: TINP0L/GP[98] CLKS0/TOUT0L/GP[97]
15:14	CKOBK	CLKOUT Block Pin Select. Selects the function of the multiplexed pins in the CLKOUT Block. 00 = GPIO Mode. Pin functions as GPIO (GP[84]). 01 = CLKOUT Mode (default). Pin functions as device clock output CLKOUT0, sourced from PLLC1 OBSCLK. 10 = PWM2 Mode. Pin functions as PWM2. 11 = Reserved	CLKOUT Block: CLKOUT0/PWM2/GP[84]
13	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–

Table 3-18. PINMUX1 Register Description (continued)

Bit	Field Name	Description	Pins Controlled
12	PWM1BK	PWM1 Block Pin Select. Selects the function of the multiplexed pins in the PWM1 Block. 0 = GPIO Mode (default). Pin functions as GPIO (GP[4]). 1 = PWM1 Mode. Pin functions as PWM1.	PWM1 Block: GP[4]/PWM1
11:10	UR0FCBK	UART0 Flow Control Block Pin Select. Selects the function of the multiplexed pins in the UART0 Flow Control Block. 00 = GPIO Mode (default). Pins function as GPIO (GP[88:87]). 01 = UART0 Flow Control Mode. Pins function as UART0 Flow Control UCTS0 and URTS0. 10 = PWM0 + GPIO Mode. Pins function as PWM0 and GPIO (GP[87]). 11 = Reserved	UART0 Flow Control Block: UCTS0/GP[87] URTS0/PWM0/GP[88]
9	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
8	UR0DBK	UART0 Data Block Pin Select. Selects the function of the multiplexed pins in the UART0 Data Block. 0 = GPIO Mode (default). Pins function as GPIO (GP[86:85]). 1 = UART0 Data Mode. Pins function as UART0 data URXD0 and UTXD0.	UART0 Data Block: URXD0/GP[85] UTXD0/GP[86]
7	RSV	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
6:4	HOSTBK	Host Block Pin Select. If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1. HOSTBK or PINMUX0.RMII to select EMAC pins. HOSTBK = 000: GPIO Mode Pins function as GPIO (GP[83:57]). HOSTBK = 001: HPI + 1 GPIO Mode. Pins function as HPI and GPIO (GP[57]). HOSTBK = 010: VLYNQ + 17 GPIO Mode. Pins function as VLYNQ (VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0]), and GP[83:67]. HOSTBK = 011: VLYNQ + MII + MDIO Mode. Pins function as VLYNQ (VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0]), MII (TXCLK, CRS, COL, TXD[3:0], RXVD, TXEN, RXER, RXCLK, RXD[3:0]), and MDIO (MDIO, MDC). When EMAC(MII) is selected, EMAC(RMII) must not be selected. PINMUX0.RMII must be set to 0. HOSTBK = 100: MII + MDIO +10 GPIO Mode. Pins function as MII (TXCLK, CRS, COL, TXD[3:0], RXVD, TXEN, RXER, RXCLK, RXD[3:0]), MDIO (MDIO, MDC), and GP[66:57]. When EMAC(MII) is selected, EMAC(RMII) must not be selected. PINMUX0.RMII must be set to 0. All other HOSTBK combinations reserved.	Host Block: VLYNQ_CLOCK/GP[57] HD0/VLYNQ_SCRUN/GP[58] HD1/VLYNQ_RXD0/GP[59] HD2/VLYNQ_RXD1/GP[60] HD3/VLYNQ_RXD2/GP[61] HD4/VLYNQ_RXD3/GP[62] HD5/VLYNQ_TXD0/GP[63] HD6/VLYNQ_TXD1/GP[64] HD7/VLYNQ_TXD2/GP[65] HD8/VLYNQ_TXD3/GP[66] HD9/MCOL/GP[67] HD10/MCRS/GP[68] HD11/MTXD3/GP[69] HD12/MTXD2/GP[70] HD13/MTXD1/GP[71] HD14/MTXD0/GP[72] HD15/MTXCLK/GP[73] HHWIL/MRXDV/GP[74] HCNTL1/MTXEN/GP[75] HCNTL0/MRXER/GP[76] HR \bar{W} /MRXCLK/GP[77] HDS2/MRXD0/GP[78] HDS1/MRXD1/GP[79] HRD \bar{Y} /MRXD2/GP[80] HCS/MDCLK/GP[81] HINT/MRXD3/GP[82] HAS/MDIO/GP[83] The HOSTBK field selects the function of these 27 pins.
3:1	RESERVED	Reserved. For proper device operation, the user should only write "0" to this bit (default).	–
0	RSV	Reserved. Writes have no effect.	–

3.7.3 Pin Multiplexing Details

This section discusses how to program each Pin Mux Block to select the desired peripheral functions.

The following steps can be used to determine pin muxing suitable for the application:

1. Understand the major configuration choices available for the specific application.
 - a. Device Major Configuration Choices: [Figure 3-10](#) shown in [Section 3.7, Multiplexed Pin Configurations](#), provides a high-level view of the device pin muxing and can be used to determine the possible mix of peripheral options for a specific application.
 - b. EMIFA Block Major Configuration Choices: The EMIFA block features extensive pin multiplexing to accommodate a variety of applications. In addition to [Figure 3-10, Section 3.7.3.11, EMIFA Block Muxing](#), provides more details on the Major Configuration choices for this block.
2. See [Section 3.7.3.1, Multiplexed Pins on C6421](#), for a summary of all the multiplexed pins on this device and the pin mux group they belong to.
3. Refer to the individual pin mux sections ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA Block Muxing](#)) for pin muxing details for a specific pin mux block.
 - a. For peripherals that span multiple pin mux blocks, the user must select the appropriate pins for that peripheral in all relevant pin mux blocks. For more details, see [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#).

For details on PINMUX0 and PINMUX1 registers, see [Section 3.7.2](#).

3.7.3.1 Multiplexed Pins on C6421

[Table 3-19](#) summarizes all of the multiplexed pins on C6421, the pin mux group for each pin, and the PINMUX register fields that control the pin. For pin mux details, see the specific pin mux group section ([Section 3.7.3.3, Host Block Muxing](#) to [Section 3.7.3.11, EMIFA Block Muxing](#)). For a description of the PINMUX register fields, see [Section 3.7.2](#).

Note: PINMUX group EMIFA Sub-Block 2 is not shown in the above table because there is **no** actual pin multiplexing in that block. However this block is still considered a "pin mux block" because it contains some of the pins necessary for EMIFA. The pins in this block are as follows:

- **EMIFA Sub-Block 2**
 - EM_WAIT/(RDY/BSY)
 - EM_OE
 - EM_WE

3.7.3.2 Peripherals Spanning Multiple Pin Mux Blocks

Some peripherals span multiple Pin Mux Blocks. To use these peripherals, they must be selected in all of the relevant Pin Mux Blocks. The following is the list of peripherals that span multiple Pin Mux Blocks:

- **McBSP0:** Six McBSP0 pins are located in the Serial Port Sub-Block 0, but the CLKS0 pin is muxed in the Timer0 Block. To select McBSP0 pins, program PINMUX registers as follows:
 - **Serial Port Sub-Block 0:** SPBK0 = 01
 - **Timer0 Block:** If CLKS0 pin is desired, program TIM0BK = 10 or 11.
- **UART0:** The two UART0 data pins are located in the UART0 Data Block, but the two UART0 flow control pins are located in the UART0 Flow Control Block. To select UART0, program PINMUX registers as follows:
 - **UART0 Data Block:** UR0BK = 1
 - **UART0 Flow Control Block:** If flow control pins are desired, program UR0FCBK = 01.

3.7.3.3 Host Block Muxing

This block of 27 pins consists of HPI, VLYNQ, EMAC(MII), MDIO, and GPIO muxed pins. The following register field selects the pin functions in the Host Block:

- PINMUX1.HOSTBK

[Table 3-20](#) summarizes the 27 pins in the Host Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-20. Host Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS

HINT/MRXD3/GP[82]	HINT	MRXD3	–	–	GP[82]			
HAS/MDIO/GP[83]	HAS	MDIO	–	–	GP[83]			

There is only one EMAC peripheral on the C6421 device, even though the pins for MII mode and the pins for RMI modes are brought out to different locations. The EMAC MII mode pins are in the Host Block, while EMAC RMI mode pins are only in the EMIFA Block. The user is only allowed to select either the MII pins or the RMI pins. The operation is undefined if the user attempts to select both MII pins and RMI pins.

Table 3-21 provides a different view of the Host Block pin muxing, showing the Host Block function based on PINMUX1 settings. The selection options are also shown pictorially in Figure 3-10.

If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK to select EMAC pins.

Table 3-21. Host Block Function Selection

PINMUX1 SETTING	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
HOSTBK		
000	GPIO (27) (Default)	GPIO: GP[83:57]
001	HPI + GPIO (1)	HPI: HHWIL, HCNTL[1:0], HR \overline{W} , HDS2, HDS1, HRDY, HCS, HINT, HAS, HD[15:0] GPIO: GP[57]

Table 3-21. Host Block Function Selection (continued)

PINMUX1 SETTING	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
HOSTBK		
010	VLYNQ + GPIO (17)	VLYNQ: VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] GPIO: GP[83:67]
011	VLYNQ + EMAC (MII) + MDIO	VLYNQ: VLYNQ_CLOCK, VLYNQ_SCRUN, VLYNQ_RXD[3:0], VLYNQ_TXD[3:0] EMAC (MII): TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] MDIO: MDC, MDIO If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK or PINMUX0.RMII to select EMAC pins.
100	EMAC (MII) + MDIO + GPIO (10)	EMAC (MII): TXCLK, CRS, COL, TXD[3:0], RXDV, TXEN, RXER, RXCLK, RXD[3:0] MDIO: MDC, MDIO GPIO: GP[66:57] If EMAC operation is desired, EMAC must be placed in reset before programming PINMUX1.HOSTBK or PINMUX0.RMII to select EMAC pins.
101 to 111	Reserved	Reserved

The VDD3P3V_PWDN.HOST field determines the power state of the Host Block pins. The Host Block pins default to powered up. For more details on the VDD3P3V_PWDN.HOST field, see [Section 3.2, Power Considerations](#).

3.7.3.4 UART0 Data Block Muxing

This block of 2 pins consists of UART0 Data, and GPIO muxed pins. The PINMUX1.UR0DBK register field select the pin functions in the UART0 Data Block.

[Table 3-22](#) summarizes the 2 pins in the UART0 Data Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-22. UART0 Data Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	UART0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
URXD0/GP[85]	URXD0	UR0DBK = 1	GP[85]	UR0DBK = 0
UTXD0/GP[86]	UTXD0		GP[86]	

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

[Table 3-23](#) provides a different view of the UART0 Data Block pin muxing, showing the UART0 Data Block function based on PINMUX1.UR0DBK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-23. UART0 Data Block Function Selection

PINMUX1.UR0DBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (2) (Default)	GPIO: GP[86:85]
1	UART0 Data	UART0: URXD0, UTXD0

In addition, the VDD3P3V_PWDN.UR0DAT field determines the power state of the UART0 Data Block pins. The UART0 Data Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0DAT = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0DAT field, see [Section 3.2, Power Considerations](#).

The UART0 Data Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.5 UART0 Flow Control Block

This block of 2 pins consists of UART0 Flow Control, PWM0, and GPIO muxed pins. The PINMUX1.UR0FCBK register field selects the pin functions in the UART0 Flow Control Block.

[Table 3-24](#) summarizes the 2 pins in the UART0 Flow Control Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-24. UART0 Flow Control Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	UART0		PWM0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
UCTS0/ GP[87]	UCTS0	UR0FCBK = 01	–	–	GP[87]	UR0FCBK = 00/10
URTS0/ PWM0/ GP[88]	URTS0		PWM0	UR0FCBK = 10	GP[88]	UR0FCBK = 00

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the UART0 pins span across two Pin Mux Blocks: UART0 Data Block, and UART0 Flow Control Block. For proper UART0 operation, the two pins in the UART0 Data Block must be configured for UART0 data functions. The two pins in the UART0 Flow Control Block are optional.

[Table 3-25](#) provides a different view of the UART0 Flow Control Block pin muxing, showing the UART0 Flow Control Block function based on PINMUX1.UR0FCBK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-25. UART0 Flow Control Block Function Selection

PINMUX1.UR0FCBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[88:87]
01	UART0 Flow Control	UART0: UCTS0, URTS0
10	PWM0 + GPIO (1)	PWM0: PWM0 GPIO: GP[87]
11	Reserved	Reserved

In addition, the VDD3P3V_PWDN.UR0FC field determines the power state of the UART0 Flow Control Block pins. The UART0 Flow Control Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.UR0FC = 0 to power up the pins. For more details on the VDD3P3V_PWDN.UR0FC field, see [Section 3.2, Power Considerations](#).

The UART0 Flow Control Block features internal pullup resistors, which matches the UART inactive polarity.

3.7.3.6 Timer0 Block

This block of 2 pins consists of Timer0 and McBSP0 muxed pins. The PINMUX1.TIM0BK register field selects the pin functions in the Timer0 Block.

[Table 3-26](#) summarizes the 2 pins in the Timer0 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-26. Timer0 Block Muxed Pins Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	McBSP		Timer0		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
TINPOL/ GP[98]	–	TIM0BK = 10	TINPOL	TIM0BK = 01/11	GP[98]	TIM0BK = 00
CLKS0/ TOUT0L/ GP[97]	CLKS0	TIM0BK = 11	TOUT0L	TIM0BK = 01	GP[97]	

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

[Table 3-27](#) provides a different view of the Timer0 Block pin muxing, showing the Timer0 Block function based on PINMUX1.TIM0BK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-27. Timer0 Block Function Selection

PINMUX1.TIM0BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[98:97]
01	Timer0	Timer0: TINPOL, TOUT0L
10	Reserved	–
11	McBSP0 External Clock Source, Timer0 Input	McBSP0: CLKS0 Timer0: TINPOL

In addition, the VDD3P3V_PWDN.TIMER0 field determines the power state of the Timer0 Block pins. The Timer0 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER0 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER0 field, see [Section 3.2, Power Considerations](#).

3.7.3.7 Timer1 Block

This block of 2 pins consists of Timer1 and GPIO muxed pins. The PINMUX1.TIM1BK register field selects the pin functions in the Timer1 Block.

[Table 3-28](#) summarizes the 2 pins in the Timer1 Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-28. Timer1 Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS			
	TIMER1		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT
TINP1L/ GP[56]	TINP1L	TIM1BK = 01	GP[56]	TIM1BK = 00
TOUT1L/ GP[55]	TOUT1L		GP[55]	

[Table 3-29](#) provides a different view of the Timer1 Block pin muxing, showing the Timer1 Block function based on PINMUX1.TIM1BK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-29. Timer1 Block Function Selection

PINMUX1.TIM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (2) (default)	GPIO: GP[56:55]
01	Timer1	Timer1: TINP1L, TOUT1L

Table 3-29. Timer1 Block Function Selection (continued)

PINMUX1.TIM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
10	Reserved	–
11	Reserved	–

In addition, the VDD3P3V_PWDN.TIMER1 field determines the power state of the Timer1 Block pins. The Timer1 Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.TIMER1 = 0 to power up the pins. For more details on the VDD3P3V_PWDN.TIMER1 field, see [Section 3.2, Power Considerations](#).

The Timer1 Block features internal pull up resistors, which matches the UART inactive polarity.

3.7.3.8 Serial Port Block

This block of 12 pins consists of McASP0, McBSP0, and GPIO muxed pins. The following register fields select the pin functions in the Serial Port Block:

- PINMUX1.SPBK0
- PINMUX1.SPBK1

The Serial Port Block is further subdivided into these sub-blocks:

- Serial Port Sub-Block 0: McBSP0, part of McASP0, and GPIO.
- Serial Port Sub-Block 1: part of McASP0 and GPIO.

[Table 3-30](#) summarizes the 12 pins in the Serial Port Block, the multiplexed function on each pin, and the PINMUX configurations to select the corresponding function.

Table 3-30. Serial Port Block Muxed Pins Selection

SIGNAL NAME	MULTIPLEXED FUNCTIONS					
	McASP0		McBSP0		GPIO	
	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
Serial Port Sub-block 0						
ACLKR0/CLKX0/GP[99]	ACLKR0	SPBK0 = 10	CLKX0	SPBK0 = 01	GP[99]	SPBK0 = 00
AFSR0/DR0/GP[100]	AFSR0		DR0		GP[100]	
AHCLKR0/CLKR0/GP[101]	AHCLKR0		CLKR0		GP[101]	
AXR0[3]/FSR0/GP[102]	AXR0[3]		FSR0		GP[102]	
AXR0[2]/FSX0/GP[103]	AXR0[2]		FSX0		GP[103]	
AXR0[1]/DX0/GP[104]	AXR0[1]		DX0		GP[104]	
Serial Port Sub-block 1						
AXR0[0]/GP[105]	AXR0[0]	SPBK1 = 10	–	–	GP[105]	SPBK1 = 00
ACLKX0/GP[106]	ACLKX0		–	–	GP[106]	
AFSX0/GP[107]	AFSX0		–	–	GP[107]	
AHCLKX0/GP[108]	AHCLKX0		–	–	GP[108]	
AMUTEIN0/GP[109]	AMUTEIN0		–	–	GP[109]	
AMUTE0/GP[110]	AMUTE0		–	–	GP[110]	

As discussed in [Section 3.7.3.2, Peripherals Spanning Multiple Pin Mux Blocks](#), the McBSP0 pins span across two Pin Mux Blocks: Serial Port Sub-Block0, and Timer0 Block. For proper McBSP0 operation, the Serial Port Sub-Block0 must be programmed to select McBSP0 function. The McBSP0 CLKS0 pin in the Timer0 Block is optional for McBSP0 operation. CLKS0 is only needed if you desire using CLKS0 as an external clock source to the McBSP0 internal sample rate generator.

Table 3-31 and Table 3-32 provide a different view of the Serial Port Block. Table 3-31 shows the Serial Port Sub-Block 0 function based on PINMUX1.SPBK0 setting. Table 3-32 shows the Serial Port Sub-Block 1 function based on PINMUX1.SPBK1 setting. These selection options are also shown pictorially in Figure 3-10.

Table 3-31. Serial Port Sub-Block 0 Function Selection

PINMUX1.SPBK0	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (default)	GPIO: GP[104:99]
01	McBSP0	McBSP0: CLKX0, FSX0, DX0, CLKR0, FSR0, DR0
10	McASP0 Receive, 3 Serializers	McASP0: ACLKR0, AFSR0, AHCLKR0, AXR0[3], AXR0[2], AXR0[1]
11	Reserved	Reserved

Table 3-32. Serial Port Sub-Block 1 Function Selection

PINMUX1.SPBK1	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (6) (default)	GPIO: GP[110:105]
01	Reserved	–
10	McASP0 Transmit with 1 Serializer and Mute Control	McASP0: AXR0[0], ACLKX0, AFSX0, AHCLKX0, AMUTEIN0 ⁽¹⁾ , AMUTE0
11	Reserved	–

(1) The input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and GPIO.

In addition, the VDD3P3V_PWDN.SP field determines the power state of the Serial Port Block pins. The Serial Port Block pins default to powered down and not operational. To use these pins, user must first program VDD3P3V_PWDN.SP = 0 to power up the pins. For more details on the VDD3P3V_PWDN.SP field, see Section 3.2, *Power Considerations*.

To facilitate McASP0 operation, the input from the AMUTEIN0/GP[109] pin is connected to both the McASP0 and the GPIO module. Therefore when an external mute event occurs, in addition to notifying the McASP0, it can also cause an interrupt through the GPIO module.

3.7.3.9 PWM1 Block

This block of 1 pin consists of PWM1 and GPIO muxed pins (GP[4]/PWM1). The PINMUX1.PWM1BK register field selects the pin function in the PWM1 Block.

Table 3-33 summarizes the 1 pin in the PWM1 Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-33. PWM1 Block Muxed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS			
	PWM1		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT
GP[4]/PWM1	PWM1	PWM1BK = 1	GP[4]	PWM1BK = 0

Table 3-34 provides a different view of the PWM1 Block pin muxing, showing the PWM1 Block function based on PINMUX1.PWM1BK setting. The selection options are also shown pictorially in Figure 3-10.

Table 3-34. PWM1 Block Function Selection

PINMUX1.PWM1BK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
0	GPIO (1) (default)	GPIO: GP[4]
1	PWM1	PWM1: PWM1

In addition, the VDD3P3V_PWDN.PWM1 field determines the power state of the PWM1 Block pin. The PWM1 Block pin defaults to powered down and not operational. To use this pin, user must first program VDD3P3V_PWDN.PWM1 = 0 to power up the pin. For more details on the VDD3P3V_PWDN.PWM1 field, see [Section 3.2, Power Considerations](#).

3.7.3.10 CLKOUT Block

This block of 1 pin consists of CLKOUT, PWM2, and GPIO muxed pin (CLKOUT0/PWM2/GP[84]). The PINMUX1.CKOBK register field selects the pin function in the CLKOUT Block.

[Table 3-35](#) summarizes the 1 pin in the CLKOUT Block, its multiplexed function, and the PINMUX configurations to select the corresponding function.

Table 3-35. CLKOUT Block Multiplexed Pin Selection

SIGNAL	MULTIPLEXED FUNCTIONS					
	CLKOUT0		PWM2		GPIO	
NAME	FUNCTION	SELECT	FUNCTION	SELECT	FUNCTION	SELECT
CLKOUT0/ PWM2/ GP[84]	CLKOUT0	CKOBK = 01	PWM2	CKOBK = 10	GP[84]	CKOBK = 00

[Table 3-36](#) provides a different view of the CLKOUT Block pin muxing, showing the CLKOUT Block function based on PINMUX1.CKOBK setting. The selection options are also shown pictorially in [Figure 3-10](#).

Table 3-36. CLKOUT Block Function Selection

PINMUX1.CKOBK	BLOCK FUNCTION	RESULTING PIN FUNCTIONS
00	GPIO (1)	GPIO: GP[84]
01	CLKOUT (default)	Device Clock-Out: CLKOUT0
10	PWM2	PWM2: PWM2
11	Reserved	Reserved

This block defaults to CLKOUT0 pin function.

In addition, the VDD3P3V_PWDN.CLKOUT field determines the power state of the CLKOUT Block pin. The CLKOUT Block pin defaults to powered up. For more details on the VDD3P3V_PWDN.CLKOUT field, see [Section 3.2, Power Considerations](#).

3.7.3.11 EMIFA Block Muxing

This block of 61 pins consists of EMIFA, EMAC(RMII), and GPIO muxed pins. The following register fields affect the pin functions in the EMIFA Block:

- All PINMUX0 register fields: AEM, CS5SEL, CS4SEL, CS3SEL, and RMII.

There is only one EMAC peripheral on the C6421 device, even though the pins for MII mode and the pins for RMII modes are brought out to different locations. The EMAC MII mode pins are in the Host Block, while EMAC RMII mode pins are only in the EMIFA Block. The user is only allowed to select either the MII pins or the RMII pins. The operation is undefined if the user attempts to select both MII pins and RMII pins.

The EMIFA Block is divided into multiple sub-blocks for ultimate flexibility in pin multiplexing to accommodate a wide variety of applications, and for the purpose of I/O pins power control:

- Sub-Block 0: multiplexed between EMIFA address/control pins, part of EMAC(RMII), and GPIO.
- Sub-Block 1: multiplexed between EMIFA data/address/control pins, part of EMAC(RMII), and GPIO.
- Sub-Block 2: no multiplexing. EMIFA control pins EM_WAIT/(RDY/BSY), EM_OE, EM_WE.
- Sub-Block 3: multiplexed between EMIFA address pins EM_A[12:6] and GPIO.

The EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register determine the power state of the EMIFA Block pins. The EMIFA Block pins default to powered up. For more details on the EMBK0, EMBK1, EMBK2, EMBK3 fields in the VDD3P3V_PWDN register, see [Section 3.2](#), *Power Considerations*.

To understand pin multiplexing in the EMIFA Block, see [Section 3.7.3.11.1](#), *EMIFA Block Major Configuration Choices* to determine the major configuration choices (A,B,C,D,E, or F). [Section 3.7.3.11.2](#), *EMIFA Block Pin-By-Pin Multiplexing Summary*, provides a pin-by-pin muxing summary for the EMIFA Block. For more information on the PINMUX0 and PINMUX1 registers, see [Section 3.7.2](#), *Pin Muxing Selection After Reset*.

3.7.3.11.1 EMIFA Block Major Configuration Choices

[Table 3-37](#) shows the major configuration choices in the EMIFA Block. Use this table to determine all of the PINMUX settings for the EMIFA Block: AEM, RMII, CS5SEL, CS4SEL, and CS3SEL.

Table 3-37. EMIFA Block Major Configuration Choices

MAJOR CONFIG. OPTION	PINMUX SELECTION FIELDS					RESULTING PERIPHERALS/PINS		
	AEM	RMII	CS3SEL	CS4SEL	CS5SEL	EMIFA ⁽¹⁾	RMII	GPIO
A	000	0	0	0	0	-	-	58 GP Pins: GP[96:89], GP[54:5]
B	000	1	0	0	0	-	RMII: RMRXER, RMRXD[1:0], RMTXD[1:0], REFCLK, RMCSDV, RMTXEN	50 GP Pins: GP[96:89], GP[54:53], GP[51:34], GP[26:5],
C	010	0	0 or 1	0 or 1	0 or 1	8-bit EMIFA (Async) Pinout Mode 2: EM_A[21:0], EM_D[7:0], EM_R/W, EM_CS2, EM_BA[1:0], EM_WAIT/(RDY/BSY), EM_WE, EM_OE <i>Optional Selection:</i> EM_CS5 (CS5SEL = 1), EM_CS4 (CS4SEL = 1), EM_CS3 (CS3SEL = 1)	-	13 GP pins: GP[54:52], GP[31:22] <i>Optional Selection:</i> GP[33] (CS5SEL = 0), GP[32] (CS4SEL = 0), GP[13] (CS3SEL = 0)
D	010	1	0 or 1	0	0	8-bit EMIFA (Async) Pinout Mode 2: EM_A[21:0], EM_D[7:0], EM_R/W, EM_CS2, EM_BA[1:0], EM_WAIT/(RDY/BSY), EM_WE, EM_OE <i>Optional Selection:</i> EM_CS3 (CS3SEL = 1)	RMII: RMRXER, RMRXD[1:0], RMTXD[1:0], REFCLK, RMCSDV, RMTXEN	7 GP pins: GP[54:53], GP[26:22] <i>Optional Selection:</i> GP[13] (CS3SEL = 0)
E	101	0	0 or 1	0 or 1	0 or 1	8-bit EMIFA (NAND) Pinout Mode 5: EM_D[7:0], EM_A[2:1], EM_CS2, EM_WAIT/(RDY/BSY), EM_WE, EM_OE <i>Optional Selection:</i> EM_CS5 (CS5SEL = 1), EM_CS4 (CS4SEL = 1), EM_CS3 (CS3SEL = 1)	-	44 GP pins: GP[96:89], GP[54:34], GP[31:22], GP[11:10], GP[7:5] <i>Optional Selection:</i> GP[33] (CS5SEL = 0), GP[32] (CS4SEL = 0), GP[13] (CS3SEL = 0)
F	101	1	0 or 1	0	0	8-bit EMIFA (NAND) Pinout Mode 5: EM_D[7:0], EM_A[2:1], EM_CS2, EM_WAIT/(RDY/BSY), EM_WE, EM_OE <i>Optional Selection:</i> EM_CS3 (CS3SEL = 1)	RMII: RMRXER, RMRXD[1:0], RMTXD[1:0], REFCLK, RMCSDV, RMTXEN	38 GP pins: GP[96:89], GP[54:34], GP[26:22], GP[11:10], GP[7:5] <i>Optional Selection:</i> GP[13] (CS3SEL = 0)

(1) The EMIFA pins EM_WAIT/(RDY/BSY), EM_OE, and EM_WE are non-multiplexed pins. They are available in all the configuration options. However, they are only useful if additional EMIFA pins are functional. Therefore in this table, these pins are only listed in configuration options C,D,E, and F.

The following is an example on how to read [Table 3-37](#). For example, the "PINMUX Selection Fields" columns indicate that Major Configuration Choice C is selected through setting PINMUX0.AEM = 010b and PINMUX0.RMII = 0. Other PINMUX0 fields CS3SEL, CS4SEL, and CS5SEL can be set to either 0 or 1 based on the system's EMIFA Chip Select space need. The "Resulting Peripherals/Pins" columns indicate that Major Configuration Option C can support the following combination of pin functions:

- Pins for 8-bit EMIFA (Async or NAND) function with EMIFA Chip Select space 2 (EM_CS2). If additional Chip Select spaces are needed, set the corresponding PINMUX bit (CS5SEL, CS4SEL, and/or CS3SEL) to 1.
- At least 13 GPIO pins. If the additional Chip Select spaces from EM_CS3, EM_CS4, or EM_CS5 are not needed, the corresponding PINMUX bit (CS3SEL, CS4SEL, and/or CS5SEL) can be set to 0 to get additional GPIO pins.

3.7.3.11.2 EMIFA Block Pin-By-Pin Multiplexing Summary

This section summarizes the EMIFA Block muxing on a pin-by-pin basis. It provides an alternative view to pin muxing in the EMIFA Block. It summarizes the EMIFA Block pin muxing by dividing up the EMIFA Block based on the PINMUX field that controls the pins. To determine the actual EMIFA Major Configuration Option for the application need, see [Section 3.7.3.11.1, EMIFA Block Major Configuration Choices](#).

[Table 3-38](#) shows the pin multiplexing control for each pin in the EMIFA Sub-Block 0. These PINMUX0 and PINMUX1 register fields control the multiplexing in this sub-block:

- PINMUX0: AEM, RMII

[Table 3-39](#) shows the pin multiplexing control for each pin in the EMIFA Sub-Block 1. These PINMUX0 register fields control the multiplexing in this sub-block:

- PINMUX0: AEM, CS5SEL, CS4SEL, CS3SEL, RMII

EMIFA Sub-Block 2 is dedicated to EMIFA pins EM_WAIT/(RDY/BSY), $\overline{\text{EM_OE}}$, and $\overline{\text{EM_WE}}$. There is no pin multiplexing in this block. These pins always function as EMIFA control pins.

[Table 3-40](#) shows the pin multiplexing control for each pin in the EMIFA Sub-Block 3. These PINMUX0 and PINMUX1 register fields control the multiplexing in this sub-block:

- PINMUX0: AEM

3.8 Device Initialization Sequence After Reset

Software should follow this initialization sequence after coming out of device reset.

1. Complete the boot sequence as needed. For more details on the boot sequence, see the *Using the TMS320C642x Bootloader* Application Report (literature number [SPRAAK5](#)).
2. If the device is not already at the desired operating frequency, program the PLL Controllers (PLL1 and PLL2) to configure the device frequency. For details on how to program the PLL, see the *C642x DSP Phase-Locked Loop Controller (PLL) User's Guide* (literature number [SPRUES0](#)).
3. Program PINMUX0 and PINMUX1 registers to select device pin functions. For more details on programming the PINMUX0 and PINMUX1 registers to select device pin functions, see [Section 3.7, Multiplexed Pin Configurations](#).

Note: If EMAC operation is desired, the EMAC **must** be placed in reset before programming PINMUX1.HOSTBK and PINMUX1.RMII to select EMAC pins.
4. Program the VDD3P3V_PWDN register to power up the necessary I/O pins. For more details on programming the VDD3P3V_PWDN register, see [Section 3.2, Power Considerations](#).
5. As needed by the application, program the following System Module registers when there are no active transactions on the respective peripherals:
 - a. HPICTL ([Section 3.6.2.1, HPI Control Register](#)): applicable for HPI **only** if a different host burst write timeout value from default is desired.
 - b. TIMERCTL ([Section 3.6.2.2, Timer Control Register](#)): applicable for Timer0 and Watchdog Timer2 **only**.
 - c. EDMATCCFG ([Section 3.6.2.3, EDMA TC Configuration Register](#)): applicable for EDMA **only**. The recommendation is to leave the EDMATCCFG register at its default.
6. Program the Power and Sleep Controller (PSC) to enable the desired peripherals. For details on how to program the PSC, see the *TMS320C642x Power and Sleep Controller (PSC) User's Guide* (literature number [SPRUEN8](#)).
7. Program the Switched Central Resource (SCR) bus priorities for the master peripherals ([Section 3.6.1](#)). This **must** be configured when there are no active transactions on the respective peripherals:
 - a. Program the MSTPRI0 and MSTPRI1 registers in the System Module. These registers can be programmed **before or after** the respective peripheral is enabled by the PSC in step 6.
 - b. Program the EDMAACC QUEPRI register, the C64x+ MDMAARBE.PRI field. These registers can only be programmed **after** the respective peripheral is enabled by the PSC in step 6.
8. Configure the C64x+ Megamodule and the peripherals.
 - a. For details on C64x+ Megamodule configuration, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number [SPRU871](#)).
 - i. **Special considerations 1:** C64x+ L1P cache—on the C6421 device, the L1P Configuration Register (L1PCFG) is device-specific and varies from what is shown in the *TMS320C64x+ DSP Megamodule Reference Guide* ([SPRU871](#)). For more details on the C6421 L1PCFG register, see [Section 2.2.1, C64x+ Memory Architecture](#). In this step, the user must modify the L1PMODE setting to a valid setting (0, 1h, 2h, or 3h) by following these steps:
 - i. Write the desired L1P cache mode to the L1PMODE field in the L1PCFG register. Valid L1PMODE settings are as follows: 0h (Cache disabled), 1h (4KB L1P cache), 2h (8KB L1P cache), or 3h (16KB L1P cache).
 - ii. Read back L1PCFG. This stalls the CPU until the mode change completes.
 - iii. Write the desired L1P cache mode to the L1PMODE field in the L1PCFG register. Valid L1PMODE settings are as follows: 0h (Cache disabled), 1h (4KB L1P cache), 2h (8KB L1P cache), or 3h (16KB L1P cache).
 - iv. Read back L1PCFG. This stalls the CPU until the mode change completes.
 - ii. **Special considerations 2:** Bootloader disables C64x+ cache—For all boot modes that default to DSPBOOTADDR = 0x0010 0000 (i.e., all boot modes except the EMIFA ROM Direct Boot,

BOOTMODE[3:0] = 0100, FASTBOOT = 0), the bootloader code disables all C64x+ cache (L2, L1P, and L1D) so that upon exit from the bootloader code, all C64x+ memories are configured as all RAM (L2CFG.L2MODE = 0h, L1PCFG.L1PMODE = 0h, and L1DCFG.L1DMODE = 0h). If cache use is required, the application code must explicitly enable the cache. For more information on boot modes, see [Section 3.4.1, Boot Modes](#). For more information on the bootloader, see the *Using the TMS320C642x Bootloader* Application Report (literature number SPRAAK5).

- b. Peripherals configuration: see the respective peripheral user's guide.

Special considerations: DDR2 memory controller—the Peripheral Bus Burst Priority Register (PBBPR) should be programmed to ensure good DDR2 throughput and to prevent command starvation (prevention of certain commands from being processed by the DDR2 memory controller). For more details, see the *TMS320C642x DSP DDR2 Memory Controller User's Guide* (literature number [SPRUEM4](#)). A hex value of 0x20 is recommended for the PBBPR PR_OLD_COUNT field to provide a good DSP performance and still allow good utilization by other modules.

3.9 Debugging Considerations

3.9.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the C642x device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The C642x features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot and Configuration Pins:* If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is **strongly recommended**, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins:* If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.
- *EMIFA Chip Select Outputs:* On C6421, the EMIFA chip select pins ($\overline{\text{EM_CS2}}$, $\overline{\text{EM_CS3}}$, $\overline{\text{EM_CS4}}$, and $\overline{\text{EM_CS5}}$) feature an internal pulldown (IPD) resistor. If these pins are connected and used as an EMIFA chip select signal, for proper device operation, an external pullup resistor **must** be used to ensure the $\overline{\text{EM_CSx}}$ function defaults to an inactive (high) state.

For the boot and configuration pins (listed in [Table 2-7, Boot Terminal Functions](#)), if they are both routed out and 3-stated (not driven), it is **strongly recommended** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot and configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the C642x, see [Section 5.3](#), *Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature*.

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

4 System Interconnect

On the C6421 device, the C64x+ Megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through a switch fabric architecture (see [Figure 4-1](#)). The switch fabric is composed of multiple switched central resources (SCRs) and multiple bridges. The SCRs establish low-latency connectivity between master peripherals and slave peripherals. Additionally, the SCRs provide priority-based arbitration and facilitate concurrent data movement between master and slave peripherals. Through an SCR, the DSP can send data to the DDR2 Memory Controller without affecting a data transfer between the EMAC and L2 memory. Bridges are mainly used to perform bus-width conversion as well as bus operating frequency conversion. For example, in [Figure 4-1](#), Bridge 6 performs a frequency conversion between a bus operating at DSP/3 clock rate and a bus operating at DSP/6 clock rate. Furthermore, Bridge 5 performs a bus-width conversion between a 64-bit bus and a 32-bit bus.

The C64x+ Megamodule, the EDMA3 transfer controllers (EDMA3TC[2:0]), and the various system peripherals can be classified into two categories: master peripherals and slave peripherals. Master peripherals are typically capable of initiating read and write transfers in the system and **do not** rely on the EDMA3 or on the CPU to perform transfers to and from them. The system master peripherals include the C64x+ Megamodule, the EDMA3 transfer controllers, VLYNQ, EMAC, and HPI. Not all master peripherals may connect to all slave peripherals. The supported connections are designated by an Y in [Table 4-1](#).

Table 4-1. System Connection Matrix

MASTER PERIPHERALS/MODULES	SLAVE PERIPHERALS/MODULES			
	C64x+ SDMA	DDR2 MEMORY CONTROLLER	SCR4 ⁽¹⁾	SCR2, SCR6, SCR7, SCR8 ⁽¹⁾
C64x+ MDMA	–	Y	–	Y
VLYNQ	Y	Y	Y	Y
EMAC	Y	Y	Y	Y
HPI	Y	Y	Y	Y
EDMA3TC's (EDMA3TC2/TC1/TC0)	Y	Y	Y	Y
C64x+ CFG	–	–	Y	Y

(1) All the peripherals/modules that support a connection to SCR2, SCR4, SCR6, SCR7, and SCR8 have access to all peripherals/modules connected to those respective SCRs.

4.1 System Interconnect Block Diagram

[Figure 4-1](#) displays the C6421 system interconnect block diagram. The following is a list that helps in the interpretation of this diagram:

- The direction of the arrows indicates either a bus master or bus slave.
- The arrow originates at a bus master and terminates at a bus slave.
- The direction of the arrows **does not** indicate the direction of data flow. Data flow is typically bi-directional for each of the documented bus paths.
- The pattern of each arrow's line indicates the clock rate at which it is operating— i.e., either DSP/3, DSP/6, or MXI/CLKIN clock rate.
- A peripheral may have multiple instances shown in [Figure 4-1](#) for the following reason:
 - The peripheral/module has master port(s) for data transfers, as well as slave port(s) for register access, data access, and/or memory access. Examples of these peripherals are C64x+ Megamodule, EDMA3, VLYNQ, HPI, and EMAC.

Figure 4-1. System Interconnect Block Diagram

5 Device Operating Conditions

5.1 Absolute Maximum Ratings Over Operating Temperature Range (Unless Otherwise Noted)⁽¹⁾

Supply voltage ranges:	Core (CV _{DD}) ⁽²⁾	–0.5 V to 1.5 V
	I/O, 3.3V (DV _{DD33}) ⁽²⁾	–0.5 V to 4.2 V
	I/O, 1.8V (DV _{DDR2} , DDR_VDDDLL, PLL_PWR18, MXV _{DD}) ⁽²⁾	–0.5 V to 2.5 V
Input voltage ranges:	V _I I/O, 3.3-V pins	–0.5 V to 4.2 V
	V _I I/O, 1.8 V	–0.5 V to 2.5 V
Output voltage ranges:	V _O I/O, 3.3-V pins	–0.5 V to 4.2 V
	V _O I/O, 1.8 V	–0.5 V to 2.5 V
Operating Junction temperature ranges, T _J :	Commercial	0C to 90C
	Automotive (Q or S suffix)	–40C to 125C
Storage temperature range, T _{stg}	(default)	–65C to 150C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to V_{SS}.

5.2 Recommended Operating Conditions⁽¹⁾

			MIN	NOM	MAX	UNIT
CV _{DD}	Supply voltage, Core (CV _{DD}) ⁽²⁾	(-7/-6/-5/-4/-Q6/-Q5/-Q4 devices)	1.14	1.2	1.26	V
		(-7/-6/-5/-4/-L/-Q5 devices)	1.0	1.05	1.1	V

F _{SYCLK1} ⁽²⁾	DSP Operating Frequency (SYCLK1), CV _{DD} = 1.2 V	-7 devices				700 MHz
		-6/-Q6 devices				600 MHz
		-5/-Q5 devices				500 MHz
		-4/-Q4 devices				400 MHz
	DSP Operating Frequency (SYCLK1), CV _{DD} = 1.05 V	-7 devices				560 MHz
		-6 devices				450 MHz
		-5/-Q5/-L devices				400 MHz
		-4 devices				350 MHz

- (1) The actual voltage *must* be determined at device power-up, and **not** be changed dynamically during run-time.
- (2) Applies to "tape and reel" part number counterparts as well. For more information, see [Section 2.7, Device and Development-Support Tool Nomenclature](#).
- (3) Oscillator 1.8 V power supply (MXV_{DD}) can be connected to the same 1.8 V power supply as DV_{DDR2}.
- (4) Oscillator ground (MXV_{SS}) must be kept separate from other grounds and connected directly to the crystal load capacitor ground.
- (5) DDR_VREF is expected to equal 0.5DV_{DDR2} of the transmitting device and to track variations in the DV_{DDR2}.
- (6) In the absence of a heat sink or direct thermal attachment on the top of the device, use the following formula to determine the device junction temperature: T_J = T_C + (Power x Psi_{JT}). Power and T_C can be measured by the user. [Section 7.1, Thermal Data for ZWT](#) and [Section 7.1.1, Thermal Data for ZDU](#) provide the junction-to-package top (Psi_{JT}) value based on airflow in the system. In the presence of a heat sink or direct thermal attachment on the top of the device, additional calculations and considerations **must** be taken into account. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for the DM64xx, DM64x, and C6000 Devices* Application Report (literature number [SPRAAL9](#)).
- (7) Applications must meet **both** the Operating Junction Temperature and Operating Ambient Temperature requirements. For more detailed information on thermal considerations, measurements, and calculations, see the *Thermal Considerations for the DM64xx, DM64x, and C6000 Devices* Application Report (literature number [SPRAAL9](#)).

5.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS ⁽¹⁾	MIN	TYP	MAX	UNIT
V _{OH}	High-level output voltage (3.3V I/O except I2C pins)	DV _{DD33} = MIN, I _{OH} = MAX	2.4			V
V _{OL}	Low-level output voltage (3.3V I/O except I2C pins)	DV _{DD33} = MIN, I _{OL} = MAX			0.4	V
	Low-level output voltage (3.3V I/O I2C pins)	I _O = 3 mA	0		0.4	V

I _{OH}	High-level output current [DC]	CLK_OUT0/PWM2/GPIO[84] and VLYNQ_CLOCK/GP[57]			–8	mA
		DDR2			–13.4	mA
		All other peripherals			–4	mA
I _{OL}	Low-level output current [DC]	CLK_OUT0/PWM2/GPIO[84] and VLYNQ_CLOCK/GP[57]			8	mA
		DDR2			13.4	mA
		All other peripherals			4	mA
I _{OZ} ⁽⁴⁾	I/O Off-state output current	V _O = DV _{DD33} or V _{SS} ; internal pull disabled			50	μA
		V _O = DV _{DD33} or V _{SS} ; internal pull enabled		±100		μA
I _{CDD}	Core (CV _{DD} , V _{DDA_1P1V}) supply current ⁽⁵⁾	CV _{DD} = 1.2 V, DSP clock = 700 MHz		597		mA
		CV _{DD} = 1.2 V, DSP clock = 600 MHz		524		mA
		CV _{DD} = 1.2 V, DSP clock = 500 MHz		460		mA
		CV _{DD} = 1.2 V, DSP clock = 400 MHz		392		mA
		CV _{DD} = 1.05 V, DSP clock = 560 MHz		442		mA
		CV _{DD} = 1.05 V, DSP clock = 450 MHz		372		mA
		CV _{DD} = 1.05 V, DSP clock = 400 MHz		341		mA
I _{DDD}	3.3V I/O (DV _{DD33}) supply current ⁽⁵⁾	DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 700 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 600 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 500 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.2 V, DSP clock = 400 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 560 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 450 MHz		13		mA
		DV _{DD} = 3.3 V, CV _{DD} = 1.05 V, DSP clock = 400 MHz		13		mA

- (1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.
- (2) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (3) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (4) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
- (5) Measured under the following conditions: 60% DSP CPU utilization doing typical activity (peripheral configurations, other housekeeping activities); DDR2 Memory Controller at 50% utilization (135 MHz), 50% writes, 32 bits, 50% bit switching; 2 MHz McBSP0 at 100% utilization and 50% switching; Timer0 at 100% utilization. At room temperature (25 C) for typical process ZWT devices. The actual current draw varies across manufacturing processes and is highly application-dependent. C642x devices are offered in two basic options: lower-power option and high-performance option. Low-power devices offer lower power consumption across temperature and voltage when compared with high-performance devices. However, high-performance devices offer higher operating speeds. For more details on core and I/O activity, as well as information relevant to board power supply design, see the *TMS320C642x Power Consumption Summary Application Report* (literature number [SPRAAO9](#)).

C _O	Output capacitance				5	pF

6 Peripheral Information and Electrical Specifications

6.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 6-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3 V I/O, $V_{ref} = 1.5$ V. For 1.8 V I/O, $V_{ref} = 0.9$ V.

Figure 6-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL} MAX and V_{OH} MIN for output clocks.

Figure 6-3. Rise and Fall Transition Time Voltage Reference Levels

6.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

6.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For the DDR2 memory controller interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the DDR2 memory controller interface timings are met. See the *Implementing DDR2 PCB Layout on the TMS320C6421/4 DMSoC* Application Report (literature number [SPRAAL7](#)).

6.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

6.3 Power Supplies

For more information regarding TI's power management products and suggested devices to power TI DSPs, visit www.ti.com/dsppower.

6.3.1 Power-Supply Sequencing

The C6421 includes one core supply (CV_{DD}), and two I/O supplies— DV_{DD33} and DV_{DDR2} . To ensure proper device operation, a specific power-up sequence **must** be followed. Some TI power-supply devices include features that facilitate power sequencing—for example, Auto-Track and Slow-Start/Enable features. For more information on TI power supplies and their features, visit www.ti.com/dsppower.

Here is a summary of the power sequencing requirements:

- The power ramp order **must** be DV_{DD33} before DV_{DDR2} , and DV_{DDR2} before CV_{DD} —meaning during power up, the voltage at the DV_{DDR2} rail should never exceed the voltage at the DV_{DD33} rail. Similarly, the voltage at the CV_{DD} rail should never exceed the voltage at the DV_{DDR2} rail.
- From the time that power ramp begins, all power supplies (DV_{DD33} , DV_{DDR2} , CV_{DD}) **must** be stable within 200 ms. The term "stable" means reaching the recommended operating condition (see [Section 5.2](#), *Recommended Operating Conditions* table).

6.3.2 Power-Supply Design Considerations

Core and I/O supply voltage regulators should be located close to the DSP to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6421 device, the PC board should include separate power planes for core, I/O, and ground; all bypassed with high-quality low-ESL/ESR capacitors.

6.3.3 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value.

Larger caps for each supply can be placed further away for bulk decoupling. Large bulk caps (on the order of 100 μ F) should be furthest away, but still as close as possible. Large caps for each supply should be placed outside of the BGA footprint.

As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

For more details on capacitor usage and placement, see the *Implementing DDR2 PCB Layout on the TMS320C642x* Application Report (literature number [SPRAAK5](#)).

6.3.4 C6421 Power and Clock Domains

The C6421 includes one single power domain — the "Always On" power domain. The "Always On" power domain is always on when the chip is on. The "Always On" domain is powered by the CV_{DD} pins of the C6421. All C6421 modules lie within the "Always On" power domain. [Table 6-1](#) provides a listing of the C6421 clock domains.

One primary reference clock is required for the C6421 device. It can be either a crystal input or driven by external oscillators. A 15–30-MHz crystal is recommended for the PLLs, which generate the internal clocks for the digital signal processor (DSP), peripherals, and the EDMA3. For further description of the C6421 clock domains, see [Table 6-2](#) and [Figure 6-4](#).

The C6421 architecture is divided into the power and clock domains shown in [Table 6-1](#). [Table 6-2](#) and [Table 6-3](#) further discuss the clock domains and their ratios. [Figure 6-4](#) shows the clock domain block diagram.

Table 6-1. C6421 Power and Clock Domains

Power Domain	Clock Domain	Peripheral/Module
Always On	CLKIN	UART0
Always On	CLKIN	I2C
Always On	CLKIN	Timer0
Always On	CLKIN	Timer1
Always On	CLKIN	Timer2
Always On	CLKIN	PWM0
Always On	CLKIN	PWM1
Always On	CLKIN	PWM2
Always On	CLKDIV3	DDR2
Always On	CLKDIV3	EDMA
Always On	CLKDIV3	SCR
Always On	CLKDIV6	GPSC
Always On	CLKDIV6	LPSCs
Always On	CLKDIV6	PLL1
Always On	CLKDIV6	PLL2
Always On	CLKDIV6	Ice Pick
Always On	CLKDIV6	EMIFA
Always On	CLKDIV6	HPI
Always On	CLKDIV6	VLYNQ
Always On	CLKDIV6	EMAC
Always On	CLKDIV6	McASP0
Always On	CLKDIV6	McBSP0
Always On	CLKDIV6	GPIO
Always On	CLKDIV1	C64x+ CPU

Table 6-2. C6421 Clock Domains

SUBSYSTEM	CLOCK DOMAIN	DOMAIN CLOCK SOURCE	FIXED RATIO vs. SYSCLK1 FREQUENCY	EXAMPLE FREQUENCY (MHz)
Peripherals (CLKIN Domain)	CLKIN	PLL1 AUXCLK ⁽¹⁾	–	25 MHz
DSP	CLKDIV1	PLL1 SYSCLK1	1:1	600 MHz
EDMA3	CLKDIV3	PLL1 SYSCLK2	1:3	200 MHz
Peripherals (CLKDIV3 Domain)	CLKDIV3	PLL1 SYSCLK2	1:3	200 MHz
Peripherals (CLKDIV6 Domain)	CLKDIV6	PLL1 SYSCLK3	1:6	100 MHz

(1) PLL1 AUXCLK runs at exactly the same frequency as the device clock source from the MXI/CLKIN pin.

The CLKDIV1:CLKDIV3:CLKDIV6 ratio must be strictly followed by programming the PLL Controller 1 (PLL1) PLLDIV1, PLLDIV2, and PLLDIV3 registers appropriately (see [Table 6-3](#)).

Table 6-3. PLL1 Programming for CLKDIV1, CLKDIV3, CLKDIV6 Domains

	CLKDIV1 DOMAIN (SYSCLK1)		CLKDIV3 DOMAIN (SYSCLK2)		CLKDIV6 DOMAIN (SYSCLK3)	
	PLL1 Divide-Down	PLLDIV1.RATIO	PLL1 Divide-Down	PLLDIV2.RATIO	PLL1 Divide-Down	PLLDIV3.RATIO
DIV1	/1	0	/3	2	/6	5
DIV2	/2	1	/6	5	/12	11
DIV3	/3	2	/9	8	/18	17

Figure 6-4. PLL1 and PLL2 Clock Domain Block Diagram

For further detail on PLL1 and PLL2, see the structure block diagrams [Figure 6-5](#) and [Figure 6-6](#), respectively.

Figure 6-5. PLL1 Structure Block Diagram

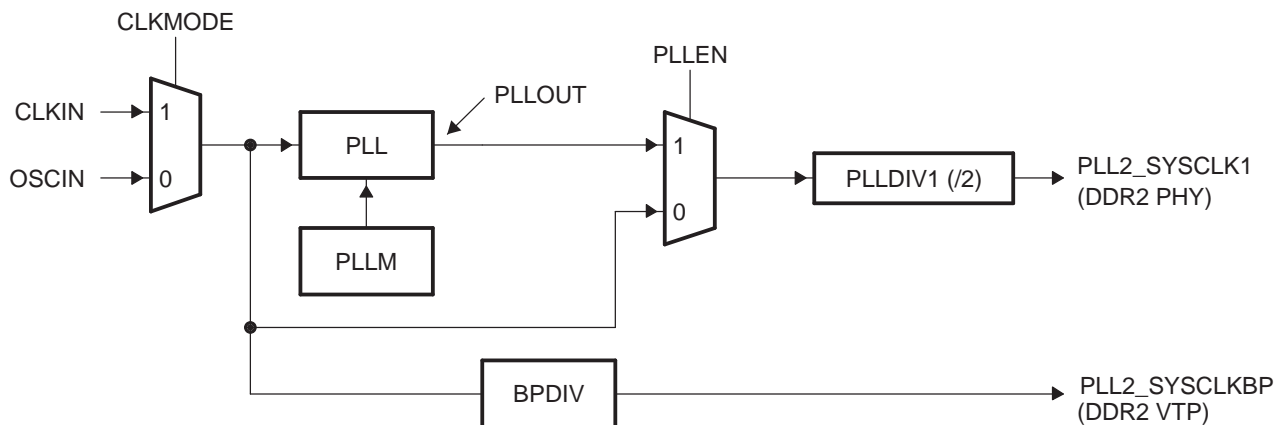

Figure 6-6. PLL2 Structure Block Diagram

6.3.5 Power and Sleep Controller (PSC)

The Power and Sleep Controller (PSC) controls power by turning off unused power domains or by gating off clocks to individual peripherals/modules. The C6421 device only utilizes the clock gating feature of the PSC for power savings. The PSC consists of a Global PSC (GPSC) and a set of Local PSCs (LPSCs). The GPSC contains memory mapped registers, PSC interrupt control, and a state machine for each peripheral/module. An LPSC is associated with each peripheral/module and provides clock and reset control. The LPSCs for C6421 are shown in [Table 6-4](#). The PSC Register memory map is given in [Table 6-5](#). For more details on the PSC, see the *TMS320C642x Power and Sleep Controller (PSC) Reference Guide* (literature number SPRUEN8).

6.4 Enhanced Direct Memory Access (EDMA3) Controller

The EDMA controller handles all data transfers between memories and the device slave peripherals on the C6421 device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses. These are summarized as follows:

- Transfer to/from on-chip memories
 - DSP L1D memory
 - DSP L2 memory
- Transfer to/from external storage
 - DDR2 SDRAM
 - NAND flash
 - Asynchronous EMIF (EMIFA)
- Transfer to/from peripherals/hosts
 - VLYNQ
 - HPI
 - McBSP0
 - McASP0
 - PWM
 - UART0

The EDMA supports two addressing modes: constant addressing and increment addressing. On the C6421, constant addressing mode is **not** supported by any peripheral or internal memory. For more information on these two addressing modes, see the *TMS320C642x DSP Enhanced DMA (EDMA) Controller User's Guide* (literature number SPRUEM5).

6.4.1 EDMA3 Channel Synchronization Events

The EDMA supports up to 64 EDMA channels which service peripheral devices and external memory. [Table 6-6](#) lists the source of EDMA synchronization events associated with each of the programmable EDMA channels. For the C6421 device, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. These specific events are captured in the EDMA event registers (ER, ERH) even if the events are disabled by the EDMA event enable registers (EER, EERH). For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *TMS320C642x DSP Enhanced DMA (EDMA) Controller User's Guide* (literature number SPRUEM5).

Table 6-6. C6421 EDMA Channel Synchronization Events⁽¹⁾

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
0-1	–	Reserved
2	XEVT0	McBSP0 Transmit Event
3	REVT0	McBSP0 Receive Event
4	–	Reserved
5	–	Reserved
6	–	Reserved
7	–	Reserved
8	–	Reserved
9	–	Reserved
10	AXEVTE0	McASP0 Transmit Event Even
11	AXEVTO0	McASP0 Transmit Event Odd

(1) In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *TMS320C642x DSP Enhanced DMA (EDMA) Controller User's Guide* (literature number SPRUEM5).

Table 6-6. C6421 EDMA Channel Synchronization Events (continued)

EDMA CHANNEL	EVENT NAME	EVENT DESCRIPTION
12	AXEVT0	McASP0 Transmit Event
13	AREVTE0	McASP0 Receive Event Even
14	AREVTO0	McASP0 Receive Event Odd
15	AREVT0	McASP0 Receive Event
16-21	–	Reserved
22	URXEVT0	UART 0 Receive Event
23	UTXEVT0	UART 0 Transmit Event
24	–	Reserved
25	–	Reserved
26	–	Reserved
27	–	Reserved
28	ICREVT	I2C Receive Event
29	ICXEVT	I2C Transmit Event
30-31	–	Reserved
32	GPINT0	GPIO 0 Interrupt
33	GPINT1	GPIO 1 Interrupt

0x0018	SRC_DST_CIDX	Source C Index, Destination C Index
0x001C	CCNT	C Count

6.5 Reset

The reset controller detects the different type of resets supported on the C6421 device and manages the distribution of those resets throughout the device.

The C6421 device has several types of device-level resets - power-on reset, warm reset, max reset, and CPU reset. Table 6-10 explains further the types of reset, the reset initiator, and the effects of each reset on the chip. See Section 6.5.9, *Reset Electrical Data/Timing*, for more information on the effects of each reset on the PLL controllers and their clocks.

Table 6-10. Device-Level Global Reset Types

TYPE	INITIATOR	EFFECT(s)
Power-on Reset (POR)	$\overline{\text{POR}}$ pin	Global chip reset (Cold reset). Activates the POR signal on chip, which resets the entire chip including the emulation logic. The power-on reset (POR) pin must be driven low during power ramp of the device. Device boot and configuration pins are latched.
Warm Reset	$\overline{\text{RESET}}$ pin	Resets everything except for the emulation logic. Emulator stays alive during Warm Reset. Device boot and configuration pins are latched.
Max Reset	Emulator, WD Timer (Timer 2)	Same as a Warm Reset, except the C6421 device boot and configuration pins are not re-latched.

In addition to device-level global resets, the PSC provides the capability to cause local resets to peripherals and/or the CPU.

6.5.1 Power-on Reset ($\overline{\text{POR}}$ Pin)

Power-on Reset (POR) is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. If an external 15–30-MHz oscillator is used on the MXI/CLKIN pin, the external clock should also be running at the correct frequency prior to de-asserting the $\overline{\text{POR}}$ pin. **Note:** a device power-up cycle is not required to initiate a Power-on Reset.

The following sequence **must** be followed during a Power-on Reset.

1. Wait for the power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low).
2. Wait for the input clock source to be stable while keeping the $\overline{\text{POR}}$ pin asserted (low).
3. Once the power supplies and the input clock source are stable, the $\overline{\text{POR}}$ pin **must** remain asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{POR}}$ pin, the following happens:

- The reset signals flow to the entire chip (including the emulation logic), resetting the modules on chip.
 - The PLL Controller clocks start at the frequency of the MXI clock. The clocks are propagated throughout the chip to reset the chip synchronously. By default, both PLL1 and PLL2 are in reset and unlocked. The PLL Controllers default to PLL Bypass Mode.
 - The RESETOUT pin stays asserted (low), indicating the device is in reset.
4. The $\overline{\text{POR}}$ pin may now be deasserted (driven high).

When the $\overline{\text{POR}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

5. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the RESETOUT pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320C642x Bootloader Application Report* (literature number SPRAAK5).

After the boot sequence, follow the software initialization sequence described in [Section 3.8, Device Initialization Sequence After Reset](#).

6.5.1.1 Usage of $\overline{\text{POR}}$ versus $\overline{\text{RESET}}$ Pins

$\overline{\text{POR}}$ and $\overline{\text{RESET}}$ are independent resets.

If the device needs to go through a power-up cycle, $\overline{\text{POR}}$ (not $\overline{\text{RESET}}$) **must** be used to fully reset the device.

In functional end-system, emulation/debugger logic is typically *not* needed; therefore, the recommendation for functional end-system is to use the $\overline{\text{POR}}$ pin for full device reset. If $\overline{\text{RESET}}$ pin is *not* needed, it can be pulled inactive (high) via an external pullup resistor.

In a debug system, it is typically desirable to allow the reset of the device without crashing an emulation session. In this case, the user can use the $\overline{\text{POR}}$ pin to achieve full device reset and use the $\overline{\text{RESET}}$ pin to achieve a debug reset—which resets the entire device except emulation logic.

6.5.1.2 Latching Boot and Configuration Pins

Internal to the chip, the two device reset pins $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ are logically AND'd together *only* for the purpose of latching device boot and configuration pins. The values on all device and boot configuration pins are latched into the BOOTCFG register when the logical AND of $\overline{\text{RESET}}$ and $\overline{\text{POR}}$ transitions from low-to-high.

6.5.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset is activated by driving the $\overline{\text{RESET}}$ pin active low. This resets everything in the device except the emulation logic. An emulator session will stay alive during warm reset.

For more information on $\overline{\text{POR}}$ vs. $\overline{\text{RESET}}$ usage, see [Section 6.5.1.1, Usage of \$\overline{\text{POR}}\$ versus \$\overline{\text{RESET}}\$ Pins](#) and [Section 6.5.1.2, Latching Boot and Configuration Pins](#).

The following sequence **must** be followed during a Warm Reset:

1. Power supplies and input clock source should already be stable.
2. The $\overline{\text{RESET}}$ pin **must** be asserted (low) for a minimum of 12 MXI cycles.

Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip, except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
3. The $\overline{\text{RESET}}$ pin may now be deasserted (driven high).

When the $\overline{\text{RESET}}$ pin is deasserted (high), the configuration pin values are latched and the PLL Controllers changed their system clocks to their default divide-down values. Both PLL Controllers are still in PLL Bypass Mode. Other device initialization also begins.

4. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. For more details on the boot sequence, see the *Using the TMS320C642x Bootloader* Application Report (literature number [SPRAAK5](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.3 Maximum Reset

A Maximum (Max) Reset is initiated by the emulator or the watchdog timer (Timer 2). The effects are the same as a warm reset, except the device boot and configuration pins are not re-latched. The emulator initiates a maximum reset via the ICEPICK module. This ICEPICK initiated reset is non-maskable. When the watchdog timer counter reaches zero, this will also initiate a maximum reset to recover from a runaway condition. The watchdog timeout reset condition is masked if the TIMERCTL.WDRST bit is cleared to "0".

To invoke the maximum reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Debug → Advanced Resets → System Reset

This is the Max Reset sequence:

1. Max Reset is initiated by the emulator or the watchdog timer.

During this time, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip except the emulation logic.
 - The PLL Controllers are reset thereby, switching back to PLL Bypass Mode and resetting all their registers to default values. Both PLL1 and PLL2 are placed in reset and lose lock.
 - The $\overline{\text{RESETOUT}}$ pin becomes asserted (low), indicating the device is in reset.
2. After device initialization is complete, the PLL Controllers pause the system clocks for 10 cycles. At the end of these 10 cycles, the $\overline{\text{RESETOUT}}$ pin is deasserted (driven high).

At this point:

- The I/O pins are controlled by the default peripherals (default peripherals are determined by PINMUX0 and PINMUX1 registers).
- The clock and reset of each peripheral is determined by the default settings of the Power and Sleep Controller (PSC).
- The PLL Controllers are operating in PLL Bypass Mode.
- The C64x+ begins executing from DSPBOOTADDR (determined by bootmode selection).

After the reset sequence, the boot sequence begins. Since the boot and configuration pins are *not* latched with a Max Reset, the previous values (as shown in the BOOTCFG register) are used to select the boot mode. For more details, see the *Using the TMS320C642x Bootloader* Application Report (literature number [SPRAAK5](#)).

After the boot sequence, follow the software initialization sequence described in [Section 3.8](#), *Device Initialization Sequence After Reset*.

6.5.4 CPU Local Reset

The C64x+ DSP CPU has an internal reset input that allows a host (HPI) to control it. This reset is configured through a register bit (MDCTL[39].LRST) in the Power Sleep Controller (PSC) module. When in C64x+ local reset, the slave DMA port on C64x+ will remain active and the internal memory will be accessible. For procedures on asserting and de-asserting CPU local reset by the host, see the *TMS320C642x Power and Sleep Controller (PSC) Reference Guide* (literature number [SPRUEN8](#)).

For information on peripheral selection at the rising edge of $\overline{\text{POR}}$ or $\overline{\text{RESET}}$, see [Section 3, Device Configurations](#) of this data manual.

6.5.5 Peripheral Local Reset

The user can configure the local reset and clock state of a peripheral through programming the PSC. [Table 6-4, C6421 LPSC Assignments](#) identifies the LPSC numbers and the peripherals capable of being locally reset by the PSC. For more detailed information on the programming of these peripherals by the PSC, see the *TMS320C642x Power and Sleep Controller (PSC) Reference Guide* (literature number [SPRUEN8](#)).

6.5.6 Reset Priority

If any of the above reset sources occur simultaneously, the PLLC only processes the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on Reset
- Maximum Reset
- Warm Reset
- CPU Reset

6.5.7 Reset Controller Register

The reset type status (RSTYPE) register (01C4 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers (see [Section 6.7.2, for the PLL1 Controller Registers](#) (including Reset Controller)). For more details on the RSTYPE register, see the *TMS320C642x DSP Phase-Locked Loop Controller (PLLC) User's Guide* (literature number [SPRUJES0](#)).

6.5.8 Pin Behaviors at Reset

During normal operations, pins are controlled by the respective peripheral selected in the PINMUX0 or PINMUX1 register. During device level global reset, the pin behaves as follows:

Multiplexed Boot and Configuration Pins

These pins are forced 3-stated when $\overline{\text{RESETOUT}}$ is asserted (low). This is to ensure the proper boot and configuration values can be latched on these multiplexed pins. This is particularly useful in the case where the boot and configuration values are driven by an external control device. After $\overline{\text{RESETOUT}}$ is deasserted (high), these pins are controlled by their respective default peripheral.

- **Boot and Configuration Pins Group:** RMTXD0/GP[28], RMTXD1/GP[27](LENDIAN), GP[26]/(FASTBOOT), GP[25]/(BOOTMODE3), GP[24]/(BOOTMODE2), GP[23]/(BOOTMODE1), GP[22]/(BOOTMODE0), EM_A[4]/GP[10]/(PLLMS2), EM_A[1]/(ALE)/GP[9]/(PLLMS1), EM_A[2]/(CLE)/GP[8]/(PLLMS0), EM_A[0]/GP[7]/(AEM2), EM_BA[0]/GP[6]/(AEM1), and EM_BA[1]/GP[5]/(AEM0).

For information on whether external pullup/pulldown resistors should be used on the boot and configuration pins, see [Section 3.9.1, Pullup/Pulldown Resistors](#).

Default Power Down Pins

As discussed in [Section 3.2, Power Considerations](#), the VDD3P3V_PWDN register controls power to the 3.3-V pins. The VDD3P3V_PWDN register defaults to powering down some 3.3-V pins to save power. For more details on the VDD3P3V_PWDN register and which 3.3-V pins default to powerup or powerdown, [Section 3.2, Power Considerations](#). The pins that default to powerdown, are both reset to powerdown and high-impedance. They remain in that state until configured otherwise by VDD3P3_PWDN and PINMUX0/PINMUX1 programming.

- **Default Power Down Pin Group:** GP[4]/PWM1, ACLKR0/CLKX0/GP[99], AFSR0/DR0/GP[100], AHCLKR0/CLKR0/GP[101], AXR0[3]/FSR0/GP[102], AXR0[2]/FSX0/GP[103], AXR0[1]/DX0/GP[104], AXR0/GP[105], ACLKX0/GP[106], AFSX0/GP[107], AHCLKX0/GP[108], AMUTEIN0/GP[109], AMUTE0/GP[110], TOUT1L/GP[55], TINP1L/GP[56], CLKS0/TOUT0L/GP[97], TINP0L/GP[98], URXD0/GP[85], UTXD0/GP[86], UCTS0/GP[87], and URTS0/PWM0/GP[88].

All Other Pins

During $\overline{\text{RESETOUT}}$ assertion (low), all other pins are controlled by the default peripheral. The default peripheral is determined by the default settings of the PINMUX0 or PINMUX1 registers.

Some of the PINMUX0/PINMUX1 settings are determined by configuration pins latched at reset. To determine the reset behavior of these pins, see [Section 3.7, Multiplexed Pin Configurations](#) and read the rest of the this subsection to understand how that default peripheral controls the pin.

The reset behaviors for all these other pins are categorized as follows (also see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#)):

- **Z+ /Low Group (Z Longer-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., $\overline{\text{POR}}$, $\overline{\text{RESET}}$ or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic low.
- **Z+ /High Group (Z Longer-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., $\overline{\text{POR}}$, $\overline{\text{RESET}}$ or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive a logic high.
- **Z+ /Invalid Group (Z Longer-to-Invalid Group):** These pins are 3-stated when device-level global reset source (e.g., $\overline{\text{POR}}$, $\overline{\text{RESET}}$ or Max Reset) is asserted. These pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins drive an invalid value until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z Group:** These pins are 3-stated by default, and these pins remain 3-stated throughout $\overline{\text{RESETOUT}}$ assertion. When $\overline{\text{RESETOUT}}$ is deasserted, these pins remain 3-stated until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).

- **Low Group:** These pins are low by default, and remain low until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **High Group:** These pins are high by default, and remain high until configured otherwise by their respective peripheral (after the peripheral is enabled by the PSC).
- **Z/Low Group (Z-to-Low Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET or Max Reset) is asserted. When the reset source is deasserted, these pins drive a logic low.
- **Z/High Group (Z-to-High Group):** These pins are 3-stated when device-level global reset source (e.g., POR, RESET or Max Reset) is asserted. When reset source is deasserted, these pins drive a logic high.
- **Clock Group:** These clock pins are toggling by default. They paused momentarily before $\overline{\text{RESETOUT}}$ is deasserted (high). The *only* pin in the Clock Group is CLKOUT0.

This is a list of possible default peripherals and how they control the pins during reset:

- **GPIO:** All GPIO pins behave according to Z Group.
Note: The following EMIFA list *only* includes pins that can default to function as EMIFA signals.
- **EMIFA:** These EMIFA signals are multiplexed with boot and configuration pins: EM_A[4], EM_A[2:0], EM_BA[0], EM_BA[1]; therefore, they are forced 3-stated throughout $\overline{\text{RESETOUT}}$.
 - **Z+/Low Group:** EM_A[4], EM_A[2:0]
 - **Z+/High Group:** EM_BA[0], EM_BA[1], $\overline{\text{EM_OE}}$, $\overline{\text{EM_WE}}$
 - **Z+/Invalid Group:** EM_D[7:0]
 - **Z/Low Group:** EM_A[21:5], EM_A[3], EM_R $\overline{\text{W}}$
 - **Z/High Group:** $\overline{\text{EM_CS2}}$
 - **Z Group:** EM_WAIT
- **DDR2 Memory Controller:**
 - **Clock Group:** DDR_CLK, $\overline{\text{DDR_CLK}}$
 - **DDR2 Z Group:** DDR_DQM[1:0], DDR_DQS[1:0], DDR_D[15:0]
 - **DDR2 Low Group:** DDR_CKE, DDR_BS[2:0], DDR_A[12:0]
 - **DDR2 High Group:** $\overline{\text{DDR_CS}}$, $\overline{\text{DDR_WE}}$, $\overline{\text{DDR_RAS}}$, $\overline{\text{DDR_CAS}}$
- **I2C:** All I2C pins behave according to Z Group.
- **JTAG:** TDO, EMU0, and EMU1 pins behave according to Z Group. TCK, TDI, TMS, and $\overline{\text{TRST}}$ are input-only pins.
- **Clock:** CLKOUT0

For more information on the pin behaviors during device-level global reset, see [Figure 6-7](#) and [Figure 6-8](#) in [Section 6.5.9, Reset Electrical Data/Timing](#).

6.5.9 Reset Electrical Data/Timing

Note: If a configuration pin *must* be routed out from the device, the internal pullup/pulldown (IPU/IPD) resistor should *not* be relied upon; TI recommends the use of an external pullup/pulldown resistor.

Table 6-11. Timing Requirements for Reset (see Figure 6-7 and Figure 6-8)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(RESSET)}$	Pulse duration, \overline{POR} low or \overline{RESET} low	12C ⁽¹⁾		ns
4	$t_{su(CONFIG)}$	Setup time, boot and configuration pins valid before \overline{POR} high or \overline{RESET} high ⁽²⁾	12C ⁽¹⁾		ns
5	$t_h(CONFIG)$	Hold time, boot and configuration pins valid after \overline{POR} high or \overline{RESET} high ⁽²⁾	0		ns

- (1) C = 1/MXI clock frequency in ns. The device clock source *must* be stable and at a valid frequency prior to meeting the $t_{w(RESSET)}$ requirement.
(2) For the list of boot and configuration pins, see Table 2-7, *Boot Terminal Functions*.

**Table 6-12. Switching Characteristics Over Recommended Operating Conditions During Reset⁽¹⁾
(see Figure 6-8)**

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
2	$t_d(RSTH-RSTOUTH)$	Delay time, \overline{POR} high or \overline{RESET} high to $\overline{RESETOUT}$ high		ns
3	$t_w(PAUSE)$	Pulse duration, SYCLKs paused (low) before $\overline{RESETOUT}$ high		ns
6	$t_d(RSTL-IV)$	Delay time, \overline{POR} low or \overline{RESET} low to pins invalid		ns
7	$t_d(RSTH-V)$	Delay time, \overline{POR} high or \overline{RESET} high to pins valid		ns
8	$t_d(RSTOUTH-V)$	Delay time, $\overline{RESETOUT}$ high to pins valid		ns
9	$t_d(RSTOUTH-IV)$	Delay time, $\overline{RESETOUT}$ high to pins invalid		ns

- (1) C = 1/CLKIN1 clock frequency in ns.

Figure 6-7 shows the Power-Up Timing. Figure 6-8 shows the Warm Reset (\overline{RESET}) Timing and Max Reset Timing are identical to Warm Reset Timing, except the boot and configuration pins are *not* relatched and the BOOTCFG register retains its previous value latched before the Max Reset were initiated.

- A. Power supplies and MXI must be stable before the start of $t_{W(RESET)}$.
- B. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-7. Power-Up Timing^(B)

A. Pin reset behavior depends on which peripheral defaults to controlling the multiplexed pin. For more details on what pin group (e.g., Z Group, Z/Low Group, Z/High Group, etc.) each pin belongs to, see [Section 6.5.8, Pin Behaviors at Reset](#).

Figure 6-8. Warm Reset ($\overline{\text{RESET}}$) Timing^(A)

6.6 External Clock Input From MXI/CLKIN Pin

The C6421 device includes two options to provide an external clock input:

- Use an on-chip oscillator with external crystal.
- Use an external 1.8-V LVCMOS-compatible clock input.

The optimal external clock input frequency is 15–30 MHz. Section 6.6.1 provides more details on Option 1, using an on-chip oscillator with external crystal. Section 6.6.2 provides details on Option 2, using an external 1.8-V LVCMOS-compatible clock input.

6.6.1 Clock Input Option 1- Crystal

In this option, a crystal is used as the external clock input to the C6421.

The 15–30-MHz oscillator provides the reference clock for all C6421 subsystems and peripherals. The on-chip oscillator requires an external 15–30-MHz crystal connected across the MXI and MXO pins, along with two load capacitors, as shown in Figure 6-9. The external crystal load capacitors **must** be connected only to the 15–30-MHz oscillator ground pin (MXV_{SS}). **Do not** connect to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8 V power supply as DV_{DDR2}.

Figure 6-9. 15–30-MHz System Oscillator

The load capacitors, C1 and C2, should be chosen such that the equation is satisfied (typical values are C1 = C2 = 10 pF). C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator pins (MXI and MXO) and to the MXV_{SS} pin.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 6-13. Input Requirements for Crystal ⁽¹⁾

PARAMETER		MIN	TYP	MAX	UNIT
	Start-up time (from power up until oscillating at stable frequency of 30 MHz)			4	ms
	Oscillation frequency	15		30	MHz
	ESR			60	Ω

(1) For audio applications, stability of the input clock is very important. The user should select crystals with low enough ppm to ensure good audio quality for the specific application.

6.6.2 Clock Input Option 2—1.8-V LVCMOS-Compatible Clock Input

In this option, a 1.8-V LVCMOS-Compatible Clock Input is used as the external clock input to the C6421. The external connections are shown in Figure 6-10. The MXI/CLKIN pin is connected to the 1.8-V LVCMOS-Compatible clock source. The MXO pin is left unconnected. The MXV_{SS} pin is connected to board ground (V_{SS}). The MXV_{DD} pin can be connected to the same 1.8-V power supply as DV_{DDR2}.

Figure 6-10. 1.8-V LVCMOS-Compatible Clock Input

The clock source **must** meet the MXI/CLKIN timing requirements in [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

6.7 Clock PLLs

There are two independently controlled PLLs on C6421. PLL1 generates the frequencies required for the DSP, DMA, and other peripherals. PLL2 generates the frequencies required for the DDR2 interface. The recommended reference clock for both PLLs is the 15–30-MHz crystal input.

6.7.1 PLL1 and PLL2

Both PLL1 and PLL2 power is supplied externally via the 1.8 V PLL power-supply pin (PLL_{PWR18}). An external EMI filter circuit **must** be added to PLL_{PWR18}, as shown in Figure 6-11. The 1.8-V supply of the EMI filter must be from the same 1.8-V power plane supplying the device's 1.8-V I/O power-supply pins (DV_{DDR2}). TI recommends EMI filter manufacturer Murata, part number NFM18CC222R1C3.

All PLL external components (C1, C2, and the EMI Filter) **must** be placed as close to the device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown in Figure 6-11. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).

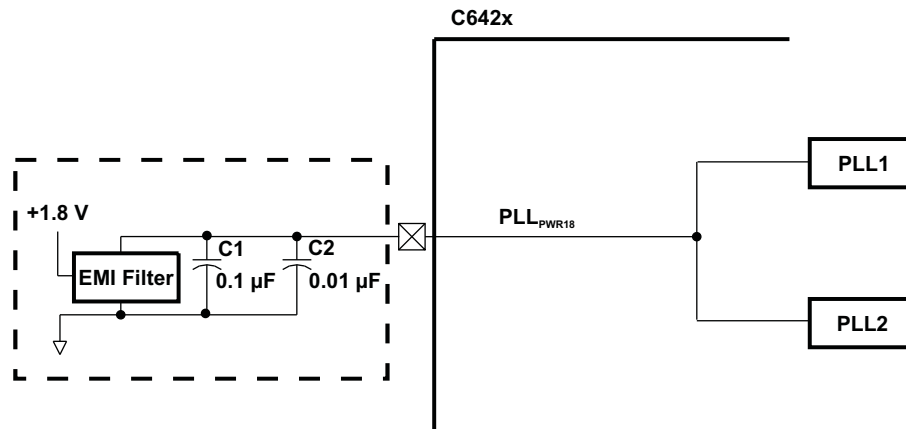

Figure 6-11. PLL1 and PLL2 External Connection

The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see Section 6.7.4, *Clock PLL Electrical Data/Timing (Input and Output Clocks)*.

There is an allowable range for PLL multiplier (PLLM). There is a minimum and maximum operating frequency for MXI/CLKIN, PLL_{OUT}, and the device clocks (SYSCLKs). The PLL Controllers **must** be configured not to exceed any of these constraints documented in this section (certain combinations of external clock inputs, internal dividers, and PLL multiply ratios might not be supported). For these constraints (ranges), see Table 6-14 through Table 6-16.

Table 6-14. PLL1 and PLL2 Multiplier Ranges

PLL MULTIPLIER (PLLM)	MIN	MAX
PLL1 Multiplier	x14	x32
PLL2 Multiplier	x14	x32

Table 6-15. PLLC1 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN ⁽¹⁾		15	30	MHz
PLLOUT CV _{DD} = 1.2 V	-7 devices	300	700	MHz
	-6/-5/-4/-Q6/-Q5/-Q4 devices	300	600	MHz
PLLOUT CV _{DD} = 1.05 V	-7 devices	300	520	MHz
	-6/-5/-4/-L/-Q5 devices	300	520	MHz
SYSCLK1 ⁽²⁾ (CLKDIV1 Domain), CV _{DD} = 1.2 V	-7 devices		700	MHz
	-6/-Q6 devices		600	MHz
	-5/-Q5 devices		500	MHz
	-4/-Q4 devices		400	MHz
SYSCLK1 ⁽²⁾ (CLKDIV1 Domain), CV _{DD} = 1.05 V	-7 devices		520	MHz
	-6 devices		450	MHz
	-5/-Q5/-L devices		400	MHz
	-4 devices		350	MHz

- (1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).
(2) Applies to "tape and reel" part number counterparts as well. For more information, see [Section 2.7, Device and Development-Support Tool Nomenclature](#).

Table 6-16. PLLC2 Clock Frequency Ranges

CLOCK SIGNAL NAME		MIN	MAX	UNIT
MXI/CLKIN ⁽¹⁾		15	30	MHz
PLLOUT	At 1.2-V CV _{DD}	300	900	MHz
	At 1.05-V CV _{DD}	300	666	MHz
PLL2_SYSCLK1 (to DDR2 PHY)			266	MHz

- (1) MXI/CLKIN input clock is used for both PLL Controllers (PLLC1 and PLLC2).

Both PLL1 and PLL2 have stabilization, lock, and reset timing requirements that **must** be followed.

The PLL stabilization time is the amount of time that **must** be allotted for the internal PLL regulators to become stable after the PLL is powered up (after PLLCTL.PLLPWRDN bit goes through a 1-to-0 transition). The PLL should *not* be operated until this stabilization time has expired. This stabilization step **must** be applied after these resets—a Power-on Reset, a Warm Reset, or a Max Reset, as the PLLCTL.PLLPWRDN bit resets to a "1". For the PLL stabilization time value, see [Table 6-17](#).

The PLL reset time is the amount of wait time needed for the PLL to properly reset (writing PLLRST = 0) before bringing the PLL out of reset (writing PLLRST = 1). For the PLL reset time value, see [Table 6-17](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLEN = 0) to when the PLL controller can be switched to PLL mode (PLEN = 1). For the PLL lock time value, see [Table 6-17](#).

Table 6-17. PLL1 and PLL2 Stabilization, Lock, and Reset Times

PLL STABILIZATION/LOCK/RESET TIME	MIN	TYP	MAX	UNIT
PLL Stabilization Time	150			μs
PLL Lock Time			2000C ⁽¹⁾	ns
PLL Reset Time	128C ⁽¹⁾			ns

- (1) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 25 MHz, use C = 40 ns.

For details on the PLL initialization software sequence, see the *TMS320C642x DSP Phase-Locked Loop Controller (PLL) User's Guide* (literature number [SPRUES0](#)).

For more information on the clock domains and their clock ratio restrictions, see [Section 6.3.4, C6421 Power and Clock Domains](#).

6.7.2 PLL Controller Register Description(s)

A summary of the PLL controller registers is shown in [Table 6-18](#). For more details, see the *TMS320C642x DSP Phase-Locked Loop Controller (PLL) User's Guide* (literature number [SPRUES0](#)).

Table 6-18. PLL and Reset Controller Registers Memory Map

HEX ADDRESS RANGE	REGISTER ACRONYM	DESCRIPTION

0x01C4 0D54 - 0x01C4 0FFF	–	Reserved

6.7.3 Clock PLL Considerations with External Clock Sources

If the internal oscillator is bypassed, to minimize the clock jitter a single clean power supply should power both the C6421 device and the external clock oscillator circuit. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#).

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the device requirements in this data manual (see [Section 5.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature](#) and [Section 6.7.4, Clock PLL Electrical Data/Timing \(Input and Output Clocks\)](#)).

6.7.4 Clock PLL Electrical Data/Timing (Input and Output Clocks)

Table 6-19. Timing Requirements for MXI/CLKIN⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾ (see [Figure 6-12](#))

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{c(MXI)}$	Cycle time, MXI/CLKIN	33.3	66.7	ns
2	$t_{w(MXIH)}$	Pulse duration, MXI/CLKIN high	0.45C	0.55C	ns
3	$t_{w(MXIL)}$	Pulse duration, MXI/CLKIN low	0.45C	0.55C	ns
4	$t_{t(MXI)}$	Transition time, MXI/CLKIN		0.05C	ns
5	$t_{j(MXI)}$	Period jitter, MXI/CLKIN		0.02C	ns

- (1) The MXI/CLKIN frequency and PLL multiply factor should be chosen such that the resulting clock frequency is within the specific range for CPU operating frequency. For example, for a -600 speed device with a 25 MHz CLKIN frequency, the PLL multiply factor should be ≤ 24 .
- (2) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
- (3) For more details on the PLL multiplier factors, see *TMS320C642x DSP Phase-Locked Loop Controller (PLL) User's Guide* (literature number [SPRUJES0](#)).
- (4) C = CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 30 MHz, use C = 33.3 ns.

Figure 6-12. MXI/CLKIN Timing

Table 6-20. Switching Characteristics Over Recommended Operating Conditions for CLKOUT0⁽¹⁾⁽²⁾
(see [Figure 6-13](#))

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	t_C Cycle time, CLKOUT0	$33.\bar{3}$	66.7	ns
2	$t_w(\text{CLKOUT0H})$ Pulse duration, CLKOUT0 high	0.45P	0.55P	ns
3	$t_w(\text{CLKOUT0L})$ Pulse duration, CLKOUT0 low	0.45P	0.55P	ns
4	$t_t(\text{CLKOUT0})$ Transition time, CLKOUT0		0.05P	ns

- (1) The reference points for the rise and fall transitions are measured at $V_{OL\ MAX}$ and $V_{OH\ MIN}$.
 (2) $P = 1/\text{CLKOUT0 clock frequency}$ in nanoseconds (ns). For example, when CLKOUT0 frequency is 30 MHz, use $P = 33.\bar{3}$ ns.

Figure 6-13. CLKOUT0 Timing

6.8 Interrupts

The C64x+ DSP interrupt controller combines device events into 12 prioritized interrupts. The source for each of the 12 CPU interrupts is user programmable and is listed in [Table 6-21](#). Also, the interrupt controller controls the generation of the CPU exception and emulation interrupts. The NMI input to the C64x+ DSP interrupt controller is not connected internally, therefore the NMI interrupt is not available. [Table 6-22](#) summarizes the C64x+ interrupt controller registers and memory locations. For more details on DSP interrupt control, see the *TMS320C64x+ DSP Megamodule Reference Guide* (literature number [SPRU871](#)).

Table 6-21. C6421 DSP System Event Mapping

DSP SYSTEM EVENT NUMBER	ACRONYM	SOURCE	DSP SYSTEM EVENT NUMBER	ACRONYM	SOURCE
0	EVT0	C64x+ Int Ctl 0	64	GPIO0	GPIO

6.9 External Memory Interface (EMIF)

C6421 supports several memory and external device interfaces, including:

- Asynchronous EMIF (EMIFA) for interfacing to NOR Flash, SRAM, etc.
- NAND Flash

6.9.1 Asynchronous EMIF (EMIFA)

The C6421 Asynchronous EMIF (EMIFA) provides an 8-bit data bus, an address bus width up to 24-bits, and 4 chip selects, along with memory control signals. These signals are multiplexed between these peripherals:

- EMIFA and NAND interfaces
- EMAC (RMII)
- GPIO

6.9.2 NAND (NAND, SmartMedia, xD)

The EMIFA interface provides both the asynchronous EMIF and NAND interfaces. Four chip selects are provided and each are individually configurable to provide either EMIFA or NAND support. The NAND features supported are as follows.

- NAND flash on up to 4 asynchronous chip selects.
- 8-bit data bus width
- Programmable cycle timings.
- Performs ECC calculation.
- NAND Mode also supports SmartMedia and xD memory cards
- Boot ROM supports booting of the C6421 from NAND flash located at CS2

The memory map for EMIFA and NAND registers is shown in [Table 6-23](#). For more details on the EMIFA and NAND interfaces, the *TMS320C642x DSP Peripherals Overview Reference Guide* (literature number SPRUEM3) and the *TMS320C642x Asynchronous External Memory Interface (EMIF) User's Guide* (literature number SPRUEM7).

6.9.3 EMIFA Electrical Data/Timing

Table 6-24. Timing Requirements for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾
(see [Figure 6-14](#) and [Figure 6-15](#))

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4			UNIT
			MIN	NOM	MAX	
READS and WRITES						
2	$t_{w(EM_WAIT)}$	Pulse duration, EM_WAIT assertion and deassertion	2E			ns
READS						
12	$t_{su(EMDV-EMOE H)}$	Setup time, EM_D[7:0] valid before $\overline{EM_OE}$ high	5			ns
13	$t_{h(EMOE H-EMDIV)}$	Hold time, EM_D[7:0] valid after $\overline{EM_OE}$ high	0			ns
14	$t_{su(EMWAIT-EMOE H)}$	Setup time, EM_WAIT asserted before $\overline{EM_OE}$ high ⁽²⁾	4E + 5			ns
WRITES						
28	$t_{su(EMWAIT-EMWE H)}$	Setup time, EM_WAIT asserted before $\overline{EM_WE}$ high ⁽²⁾	4E + 5			ns

- (1) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 600 MHz, use E = 10 ns.
- (2) Setup before end of STROBE phase (if no extended wait states are inserted) by which EM_WAIT must be asserted to add extended wait states. [Figure 6-16](#) and [Figure 6-17](#) describe EMIF transactions that include extended wait states inserted during the STROBE phase. However, cycles inserted as part of this extended wait period should not be counted; the 4E requirement is to the start of where the HOLD phase would begin if there were no extended wait cycles.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module⁽¹⁾⁽²⁾ (see Figure 6-14 and Figure 6-15)

10	t_w (EMOEL) $\overline{EM_OE}$ active low width		(RST + 1) * E ⁽³⁾		ns
11	t_d (EMWAITH-EMOEH) Delay time from EM_WAIT deasserted to $\overline{EM_OE}$ high			4E + 4	ns
WRITES					
15	t_c (EMWCYCLE) EMIF write cycle time		(WS + WST + WH + TA + 4) * E ⁽³⁾		ns
16	t_{su} (EMCSL-EMWEL) Output setup time, $\overline{EM_CS}[5:2]$ low to $\overline{EM_WE}$ low (SS = 0)	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
		-4		4	ns
17	t_h (EMWEH-EMCSH) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_CS}[5:2]$ high (SS = 0)	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
		-4		4	ns
18	t_{su} (EMRNW-EMWEL) Output setup time, $\overline{EM_R/W}$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
19	t_h (EMWEH-EMRNW) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_R/W}$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
20	t_{su} (EMBAV-EMWEL) Output setup time, $\overline{EM_BA}[1:0]$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
21	t_h (EMWEH-EMBAIV) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_BA}[1:0]$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns
22	t_{su} (EMAV-EMWEL) Output setup time, $\overline{EM_A}[21:0]$ valid to $\overline{EM_WE}$ low	(WS + 1) * E - 4		(WS + 1) * E + 4	ns
23	t_h (EMWEH-EMAV) Output hold time, $\overline{EM_WE}$ high to $\overline{EM_A}[21:0]$ invalid	(WH + 1) * E - 4		(WH + 1) * E + 4	ns

(1) RS = Read setup, RST = Read STrobe, RH = Read Hold, WS = Write Setup, WST = Write STrobe, WH = Write Hold, TA = Turn Around, EW = Extend Wait mode, SS = Select Strobe mode. These parameters are programmed via the Asynchronous n Configuration and Asynchronous Wait Cycle Configuration Registers.
 (2) E = SYSCLK3 period in ns for EMIFA. For example, when running the DSP CPU at 600 MHz, use E = 10 ns.
 (3) When EW = 1, the EMIF will extend the strobe period up to 4,096 additional cycles when the EM_WAIT pin is asserted by the external device.

Table 6-25. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module (see Figure 6-14 and Figure 6-15) (continued)

6.9.4 DDR2 Memory Controller

The DDR2 Memory Controller is a dedicated interface to DDR2 SDRAM. It supports JESD79D-2A standard compliant DDR2 SDRAM Devices and can interface to either 16-bit or 32-bit DDR2 SDRAM devices. For details on the DDR2 Memory Controller, see the *TMS320C642x DSP Peripherals Overview Reference Guide* (literature number [SPRUEM3](#)) and the *TMS320C642x DSP DDR2 Memory Controller User's Guide* (literature number [SPRUEM4](#)).

A memory map of the DDR2 Memory Controller registers is shown in [Table 6-26](#).

Table 6-26. DDR2 Memory Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C4 004C	DDRVTPER	DDR2 VTP Enable Register
0x01C4 2038	DDRVTPR	DDR2 VTP Register

6.9.4.1 DDR2 Memory Controller Electrical Data/Timing

The *Implementing DDR2 PCB Layout on the TMS320C6421/4 DMSoC* Application Report (literature number [SPRAAL7](#)) specifies a complete DDR2 interface solution for the C6421 as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met.

TI only supports board designs that follow the guidelines outlined in the *Implementing DDR2 PCB Layout on the TMS320C6421/4 DMSoC* Application Report (literature number [SPRAAL7](#)).

Table 6-27. Switching Characteristics Over Recommended Operating Conditions for DDR2 Memory Controller⁽¹⁾⁽²⁾(see [Figure 6-18](#))

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_{c(DDR_CLK)}$ Cycle time, DDR_CLK	6	8	ns

(1) DDR_CLK cycle time = 2 x PLL2 _SYSCLK1 cycle time.

(2) The PLL2 Controller **must** be programmed such that the resulting DDR_CLK clock frequency is within the specified range.

Figure 6-18. DDR2 Memory Controller Clock Timing

6.10 Universal Asynchronous Receiver/Transmitter (UART)

C6421 has 1 UART peripheral (UART0). UART0 has the following features:

- 16-byte storage space for both the transmitter and receiver FIFOs
- 1, 4, 8, or 14 byte selectable receiver FIFO trigger level for autoflow control and DMA
- DMA signaling capability for both received and transmitted data
- Programmable auto-rts and auto-cts for autoflow control
- Frequency pre-scale values from 1 to 65,535 to generate appropriate baud rates
- Prioritized interrupts
- Programmable serial data formats
 - 5, 6, 7, or 8-bit characters
 - Even, odd, or no parity bit generation and detection
 - 1, 1.5, or 2 stop bit generation
- False start bit detection
- Line break generation and detection
- Internal diagnostic capabilities
 - Loopback controls for communications link fault isolation
 - Break, parity, overrun, and framing error simulation
- Modem control functions (CTS, RTS) on

The UART0 register is listed in [Table 6-28](#).

6.10.1 UART Peripheral Register Description(s)

Table 6-28. UART0 Register Descriptions

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x01C2 0000	RBR	UART0 Receiver Buffer Register (Read Only)

6.10.2 UART Electrical Data/Timing

Table 6-29. Timing Requirements for UARTx Receive⁽¹⁾ (see Figure 6-19)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
4	$t_w(\text{URXDB})$	Pulse duration, UART receive data bit (URXDx) [15/30/100 pF]	0.96U	1.05U	ns
5	$t_w(\text{URXSB})$	Pulse duration, UART receive start bit [15/30/100 pF]	0.96U	1.05U	ns

(1) U = UART baud time = 1/programmed baud rate.

Table 6-30. Switching Characteristics Over Recommended Operating Conditions for UARTx Transmit⁽¹⁾ (see Figure 6-19)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$f_{(\text{baud})}$	Maximum programmable baud rate		128 kHz
2	$t_w(\text{UTXDB})$	U - 2	U + 2	ns
3	$t_w(\text{UTXSB})$	U - 2	U + 2	ns

(1) U = UART baud time = 1/programmed baud rate.

Figure 6-19. UARTx Transmit/Receive Timing

6.11 Inter-Integrated Circuit (I2C)

The inter-integrated circuit (I2C) module provides an interface between C6421 and other devices compliant with Philips Semiconductors Inter-IC bus (I²C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to Remove Noise 50 ns or less
- Seven- and Ten-Bit Device Addressing Modes
- Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

Figure 6-20. I2C Module Block Diagram

For more detailed information on the I2C peripheral, see the *TMS320C642x DSP Peripherals Overview Reference Guide* (literature number SPRUEM3).

6.11.1 I2C Peripheral Register Description(s)

Table 6-31. I2C Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME

6.11.2 I2C Electrical Data/Timing

6.11.2.1 Inter-Integrated Circuits (I2C) Timing

Table 6-32. Timing Requirements for I2C Timings⁽¹⁾ (see Figure 6-21)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_c(\text{SCL})$	Cycle time, SCL	10		2.5		μs
2	$t_{su}(\text{SCLH-SDAL})$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
3	$t_h(\text{SCLL-SDAL})$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
4	$t_w(\text{SCLL})$	Pulse duration, SCL low	4.7		1.3		μs
5	$t_w(\text{SCLH})$	Pulse duration, SCL high	4		0.6		μs
6	$t_{su}(\text{SDAV-SCLH})$	Setup time, SDA valid before SCL high	250		100 ⁽²⁾		ns
7	$t_h(\text{SDA-SCLL})$	Hold time, SDA valid after SCL low	0 ⁽³⁾		0 ⁽³⁾	0.9 ⁽⁴⁾	μs
8	$t_w(\text{SDAH})$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
9	$t_r(\text{SDA})$	Rise time, SDA		1000	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
10	$t_r(\text{SCL})$	Rise time, SCL		1000	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
11	$t_f(\text{SDA})$	Fall time, SDA		300	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
12	$t_f(\text{SCL})$	Fall time, SCL		300	$20 + 0.1C_b$ ⁽⁵⁾	300	ns
13	$t_{su}(\text{SCLH-SDAH})$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
14	$t_w(\text{SP})$	Pulse duration, spike (must be suppressed)			0	50	ns
15	C_b ⁽⁵⁾	Capacitive load for each bus line		400		400	pF

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus system, but the requirement $t_{su}(\text{SDA-SCLH}) \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \text{ max} + t_{su}(\text{SDA-SCLH}) = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_h(\text{SDA-SCLL})$ has only to be met if the device does not stretch the low period [$t_w(\text{SCLL})$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 6-21. I2C Receive Timings

Table 6-33. Switching Characteristics for I2C Timings⁽¹⁾ (see Figure 6-22)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4				UNIT
		STANDARD MODE		FAST MODE

29	C_p Capacitance for each I2C pin		10		10	pF

(1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

Figure 6-22. I2C Transmit Timings

6.12 Host-Port Interface (HPI) Peripheral

6.12.1 HPI Device-Specific Information

The C6421 device includes a user-configurable 16-bit Host-port interface (HPI16).

Software handshaking via the HRDY bit of the Host Port Control Register (HPIC) is not supported on the C6421.

6.12.2 HPI Peripheral Register Description(s)

Table 6-34. HPI Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
01C6 7800	PID	Peripheral Identification Register	
01C6 7804	PWREMU_MGMT	HPI power and emulation management register	The CPU has read/write access to the PWREMU_MGMT register.
01C6 7808 - 01C6 7824	-	Reserved	
01C6 7828	-	Reserved	
01C6 782C	-	Reserved	
01C6 7830	HPIC	HPI control register	The Host and the CPU both have read/write access to the HPIC register.
01C6 7834	HPIA (HPIAW) ⁽¹⁾	HPI address register (Write)	The Host has read/write access to the HPIA registers.
01C6 7838	HPIA (HPIAR) ⁽¹⁾	HPI address register (Read)	The CPU has only read access to the HPIA registers.
01C6 783C - 01C6 7FFF	-	Reserved	

(1) There are two 32-bit HPIA registers: HPIAR for read operations and HPIAW for write operations. The HPI can be configured such that HPIAR and HPIAW act as a single 32-bit HPIA (single-HPIA mode) or as two separate 32-bit HPIAs (dual-HPIA mode) from the perspective of the Host. The CPU can access HPIAW and HPIAR independently. For more details about the HPIA registers and their modes, see the *TMS320C642x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRUEM9](#)).

6.12.3 HPI Electrical Data/Timing

Table 6-35. Timing Requirements for Host-Port Interface Cycles⁽¹⁾⁽²⁾ (see [Figure 6-23](#) through [Figure 6-24](#))

NO.		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
1	$t_{su}(SELV-HSTBL)$ Setup time, select signals ⁽³⁾ valid before $\overline{HSTROBE}$ low	5		ns
2	$t_h(HSTBL-SELV)$ Hold time, select signals ⁽³⁾ valid after $\overline{HSTROBE}$ low	2		ns
3	$t_w(HSTBL)$ Pulse duration, $\overline{HSTROBE}$ active low	15		ns
4	$t_w(HSTBH)$ Pulse duration, $\overline{HSTROBE}$ inactive high between consecutive accesses	2M		ns
11	$t_{su}(HDV-HSTBH)$ Setup time, host data valid before $\overline{HSTROBE}$ high	5		ns
12	$t_h(HSTBH-HDV)$ Hold time, host data valid after $\overline{HSTROBE}$ high	0		ns
13	$t_h(HRDYL-HSTBL)$ Hold time, $\overline{HSTROBE}$ high after \overline{HRDY} low. $\overline{HSTROBE}$ should not be inactivated until \overline{HRDY} is active (low); otherwise, HPI writes will not complete properly.	0		ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.

(2) $M = \text{SYSCLK3 period} = (\text{CPU clock frequency})/6$ in ns. For example, when running parts at 600 MHz, use $M = 10$ ns.

(3) Select signals include: $\overline{HCNTL}[1:0]$, $\overline{HR}/\overline{W}$ and \overline{HHWIL} .

Table 6-36. Switching Characteristics for Host-Port Interface Cycles⁽¹⁾⁽²⁾⁽³⁾
(see [Figure 6-23](#) through [Figure 6-24](#))

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT	
			MIN	MAX		
5	$t_{d(HSTBL-HRDYV)}$	Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} valid	<p>For HPI Write, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Write conditions; otherwise, \overline{HRDY} stays low (<i>ready</i>): Case 1: Back-to-back HPIA writes (can be either first or second half-word) Case 2: HPIA write following a PREFETCH command (can be either first or second half-word) Case 3: HPID write when FIFO is full or flushing (can be either first or second half-word) Case 4: HPIA write and Write FIFO not empty</p> <p>For HPI Read, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Read conditions: Case 1: HPID read (with auto-increment) and data not in Read FIFO (can only happen to first half-word of HPID access) Case 2: First half-word access of HPID Read without auto-increment</p> <p>For HPI Read, \overline{HRDY} stays low (<i>ready</i>) for these HPI Read conditions: Case 1: HPID read with auto-increment and data is already in Read FIFO (applies to either half-word of HPID access) Case 2: HPID read without auto-increment and data is already in Read FIFO (always applies to second half-word of HPID access) Case 3: HPIC or HPIA read (applies to either half-word access)</p>		12	ns
6	$t_{en(HSTBL-HD)}$	Enable time, HD driven from $\overline{HSTROBE}$ low	2		ns	
7	$t_{d(HRDYL-HDV)}$	Delay time, \overline{HRDY} low to HD valid	0		ns	
8	$t_{oh(HSTBH-HDV)}$	Output hold time, HD valid after $\overline{HSTROBE}$ high	1.5		ns	
14	$t_{dis(HSTBH-HDV)}$	Disable time, HD high-impedance from $\overline{HSTROBE}$ high	12		ns	
15	$t_{d(HSTBL-HDV)}$	Delay time, $\overline{HSTROBE}$ low to HD valid	<p>For HPI Read. Applies to conditions where data is already residing in HPID/FIFO: Case 1: HPIC or HPIA read Case 2: First half-word of HPID read with auto-increment and data is already in Read FIFO Case 3: Second half-word of HPID read with or without auto-increment</p>		15	ns
18	$t_{d(HSTBH-HRDYV)}$	Delay time, $\overline{HSTROBE}$ high to \overline{HRDY} valid	<p>For HPI Write, \overline{HRDY} can go high (<i>not ready</i>) for these HPI Write conditions; otherwise, \overline{HRDY} stays low (<i>ready</i>): Case 1: HPID write when Write FIFO is full (can happen to either half-word) Case 2: HPIA write (can happen to either half-word) Case 3: HPID write without auto-increment (only happens to second half-word)</p>		12	ns

(1) $M = \text{SYSCLK3 period} = (\text{CPU clock frequency})/6$ in ns. For example, when running parts at 600 MHz, use $M = 10$ ns.
(2) $\overline{HSTROBE}$ refers to the following logical operation on HCS, HDS1, and HDS2: $[\text{NOT}(\text{HDS1 XOR HDS2})] \text{ OR HCS}$.
(3) By design, whenever HCS is driven inactive (high), HPI will drive \overline{HRDY} active low.

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C642x Host Port Interface (HPI) User's Guide* (literature number SPRUEM9).
- C. $\overline{\text{HCS}}$ reflects typical $\overline{\text{HCS}}$ behavior when $\overline{\text{HSTROBE}}$ assertion is caused by $\overline{\text{HDS1}}$ or $\overline{\text{HDS2}}$. $\overline{\text{HCS}}$ timing requirements are reflected by parameters for $\overline{\text{HSTROBE}}$.

Figure 6-23. HPI16 Read Timing ($\overline{\text{HAS}}$ Not Used, Tied High)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C642x Host Port Interface (HPI) User's Guide* (literature number SPRUEM9).

Figure 6-24. HPI16 Write Timing ($\overline{\text{HAS}}$ Not Used, Tied High)

6.13 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer

6.13.1 McBSP Peripheral Register Description(s)

Table 6-37. McBSP 0 Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS

6.13.1.1 McBSP Electrical Data/Timing

6.13.1.1.1 Multichannel Buffered Serial Port (McBSP) Timing

Table 6-38. Timing Requirements for McBSP⁽¹⁾ (see Figure 6-25)

NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	2P ⁽²⁾⁽³⁾		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P - 1 ⁽⁴⁾		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	14		ns
			CLKR ext	4		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	4		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	14		ns
			CLKR ext	4		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3.5		ns
			CLKR ext	3		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	14		ns
			CLKX ext	4		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	3		

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10ns.
- (3) Use whichever value is greater. Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

Table 6-39. Switching Characteristics Over Recommended Operating Conditions for McBSP⁽¹⁾⁽²⁾
(see [Figure 6-25](#))

NO.	PARAMETER		-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT	
			MIN	MAX		
1	$t_{d(CKSH-CKRXH)}$	Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input		3	10	ns
2	$t_c(CKRX)$	Cycle time, CLKR/X	CLKR/X int	$2P^{(3)(4)(5)}$		ns
3	$t_w(CKRX)$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X int	$C - 2^{(6)}$	$C + 2^{(6)}$	ns
4	$t_{d(CKRH-FRV)}$	Delay time, CLKR high to internal FSR valid	CLKR int	-4	5.5	ns
9	$t_{d(CKXH-FXV)}$	Delay time, CLKX high to internal FSX valid	CLKX int	-4	5.5	ns
			CLKX ext	2.5	14.5	
12	$t_{dis(CKXH-DXHZ)}$	Disable time, DX high impedance following last data bit from CLKX high	CLKX int	-5.5	7.5	ns
			CLKX ext	-2.1	16	
13	$t_{d(CKXH-DXV)}$	Delay time, CLKX high to DX valid	CLKX int	$-4 + D1^{(7)}$	$5.5 + D2^{(7)}$	ns
			CLKX ext	$2.5 + D1^{(7)}$	$14.5 + D2^{(7)}$	
14	$t_{d(FXH-DXV)}$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int	$-4^{(8)}$	$5^{(8)}$	ns
			FSX ext	$1^{(8)}$	$14.5^{(8)}$	

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) Minimum delay times also represent minimum output hold times.
- (3) Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) P = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use P = 10ns.
- (5) Use whichever value is greater.
- (6) C = H or L
S = sample rate generator input clock = P if CLKSM = 1 (P = SYSCLK3 period)
S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)
H = CLKX high pulse width = $(CLKGDV/2 + 1) * S$ if CLKGDV is even
H = $(CLKGDV + 1)/2 * S$ if CLKGDV is odd
L = CLKX low pulse width = $(CLKGDV/2) * S$ if CLKGDV is even
L = $(CLKGDV + 1)/2 * S$ if CLKGDV is odd
CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see (4) above).
- (7) Extra delay from CLKX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P
- (8) Extra delay from FSX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P

A. Parameter No. 13 applies to the first data bit *only* when XDATDLY \neq 0.

6.14 Multichannel Audio Serial Port (McASP0) Peripheral

The McASP functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and intercomponent digital audio interface transmission (DIT).

6.14.1 McASP0 Device-Specific Information

The C6421 device includes one multichannel audio serial port (McASP) interface peripheral (McASP0). The McASP0 is a serial port optimized for the needs of multichannel audio applications.

The McASP0 consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or alternatively, the transmit and receive sections may be synchronized. The McASP module also includes a pool of 16 shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP supports the TDM synchronous serial format.

The McASP can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format. However, the transmit and receive formats need not be the same.

Both the transmit and receive sections of the McASP also support burst mode which is useful for non-audio data (for example, passing control information between two DSPs).

The McASP peripheral has additional capability for flexible clock generation, and error detection/handling, as well as error management.

For more detailed information on and the functionality of the McASP0 peripheral, see the *TMS320C642x DSP Multichannel Audio Serial Port (McASP) User's Guide* (literature number SPRUEN1).

6.14.1.1 McASP Block Diagram

Figure 6-31 illustrates the major blocks along with external signals of the C6421 McASP0 peripheral; and shows the 4 serial data [AXR] pins.

Figure 6-33. McASP Output Timings

6.15 Ethernet Media Access Controller (EMAC)

The Ethernet Media Access Controller (EMAC) provides an efficient interface between C6421 and the network. The C6421 EMAC supports two interface modes – Media Independent Interface (MII) and Reduced Media Independent Interface (RMII). The MII mode supports both 10Base-T (10 Mbits/second [Mbps]) and 100Base-TX (100 Mbps) in either half- or full-duplex mode. The RMII mode supports both 10Base-T (10 Mbits/second [Mbps]) and 100Base-TX (100 Mbps) in full-duplex mode only. The EMAC module also supports hardware flow control and quality of service (QOS).

The EMAC controls the flow of packet data from the C6421 device to the PHY. The MDIO module controls PHY configuration and status monitoring.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

Both the EMAC and the MDIO modules interface to the C6421 device through a custom interface that allows efficient data transmission and reception. This custom interface is referred to as the EMAC control module, and is considered integral to the EMAC/MDIO peripheral. The control module is also used to multiplex and control interrupts.

For more details on the C6421 EMAC peripheral, see the *TMS320C6421 Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number [SPRUEM6](#)). For a list of supported registers and register fields, see [Table 6-53](#) [Ethernet MAC (EMAC) Control Registers] and [Table 6-54](#) [EMAC Statistics Registers] in this data manual.

6.15.1 EMAC Device-Specific Information

Interface Modes

The EMAC module on the TMS320C6421 supports two interface modes: Media Independent Interface (MII) and Reduced Media Independent Interface (RMII). The MII interface mode is defined in the IEEE 802.3-2002 standard.

The RMII mode of the EMAC conforms to the RMII Specification (revision 1.2), as written by the RMII Consortium. As the name implies, the Reduced Media Independent Interface (RMII) mode is a reduced pin count version of the MII mode and only supports full-duplex mode.

Interface Mode Select

Although, the EMAC uses different pins for the MII and RMII modes, only one mode can be used at a time because both modes share the same EMAC peripheral module. It is the user's responsibility to select only one mode via the PINMUX1 register settings (specifically, the HOSTBK and RMII bit fields). For a detailed description of pin functions, see [Section 2.5](#), *Terminal Functions*.

Note: In addition, the EMAC *must* be placed in reset (via the Power and Sleep Controller [PSC]) before programming the PINMUX0 and PINMUX1 registers to select the EMAC pins.

Using the RMII Mode of the EMAC

The EMAC contains logic that allows it to communicate using the Reduced Media Independent Interface (RMII) protocol. This logic must be taken out of reset before being used. To use the RMII mode of the EMAC follow these guidelines:

- Supply a 50 MHz reference clock to the RMREFCLK input pin.
- The PINMUX1 register RMII bit field **must** be programmed to "1" to select the RMII pins and the RMII mode of operation.
- MACCONTROL.RMIISPEED **must** be programmed to the desired operating speed for the RMII interface.
- MACCONTROL.FULLDUPLEX **must** be programmed to "1", selecting full duplex mode for RMII.

6.15.2 EMAC Peripheral Register Description(s)

Table 6-53. Ethernet MAC (EMAC) Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
01C8 0000	TXIDVER	Transmit Identification and Version Register
01C8 0004	TXCONTROL	Transmit Control Register

		MIN	MAX	
1	$t_d(REFCLKH-MTXD)$ Delay time, RMREFCLK high to transmit selected signals valid	2.2	15.5	ns

(1) Transmit selected signals include: RMTXD1-RMTXD0, and RMTXEN.

Figure 6-40. EMAC Transmit Interface Timing [RMI Operation]

6.16 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. Only one PHY may be connected at any given time.

For more detailed information on the MDIO peripheral, see the *TMS320C642x Ethernet Media Access Controller (EMAC)/Management Data Input/Output (MDIO) Module User's Guide* (literature number SPRUEM6). For a list of supported registers and register fields, see [Table 6-64 \[MDIO Registers\]](#) in this data manual.

6.17 Timers

The C6421 device has 3 64-bit general-purpose timers which have the following features:

- 64-bit count-up counter
- Timer modes:
 - 64-bit general-purpose timer mode (Timer 0 and 1)
 - Dual 32-bit general-purpose timer mode (Timer 0 and 1)
 - Watchdog timer mode (Timer 2)
- 2 possible clock sources:
 - Internal clock
 - External clock input via timer input pin TINPL (Timer 0 and 1 only)
- 2 operation modes:
 - One-time operation (timer runs for one period then stops)
 - Continuous operation (timer automatically resets after each period)
- Generates interrupts to the DSP
- Generates sync event to EDMA
- Causes device global reset upon watchdog timer timeout (Timer 2 only)

For more detailed information, see the *TMS320C642x DSP 64-Bit Timer User's Guide* (literature number SPRUEN5).

			TINP1L	2P	ns
2	$t_{w(TINPL)}$	Pulse duration, TINPxL low	TINP0L, if TIMERCTL.TINPOSEL = 0 [default]	2P	ns
			TINP0L, if TIMERCTL.TINPOSEL = 1	0.33P	ns
			TINP1L	2P	ns

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 25 MHz, use P = 40 ns.
- (2) The TIMERCTL.TINPOSEL field in the System Module determines if the TINP0L input directly goes to Timer 0 (TIMERCTL.TINPOSEL=0), or if the TINP0L input is first divided down by 6 before going to Timer 0 (TIMERCTL.TINPOSEL=1).
- (3) TINP1L input goes directly to Timer 1.

Table 6-71. Switching Characteristics Over Recommended Operating Conditions for Timer Output⁽¹⁾ (see Figure 6-43)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
3	$t_{w(TOUTH)}$	Pulse duration, TOUTxL high	P		ns
4	$t_{w(TOURL)}$	Pulse duration, TOUTxL low	P		ns

- (1) P = MXI/CLKIN cycle time in ns. For example, when MXI/CLKIN frequency is 25 MHz, use P = 40 ns.

6.18 Pulse Width Modulator (PWM)

The 3 C6421 Pulse Width Modulator (PWM) peripherals support the following features:

- Period counter
- First-phase duration counter
- Repeat count for one-shot operation
- Configurable to operate in either one-shot or continuous mode
- Buffered period and first-phase duration registers
- One-shot operation triggerable by hardware events with programmable edge transitions. (low-to-high or high-to-low).
- One-shot operation generates N+1 periods of waveform, N being the repeat count register value
- Emulation support

The register memory maps for PWM0/1/2 are shown in [Table 6-72](#), [Table 6-73](#), and [Table 6-74](#).

6.19 VLYNQ

The C6421 VLYNQ peripheral provides a high speed serial communications interface with the following features.

- Low Pin Count
- Scalable Performance / Support
- Simple Packet Based Transfer Protocol for Memory Mapped Access
 - Write Request / Data Packet
 - Read Request Packet
 - Read Response Data Packet
 - Interrupt Request Packet
- Supports both Symmetric and Asymmetric Operation
 - Tx pins on first device connect to Rx pins on second device and vice versa
 - Data pin widths are automatically detected after reset
 - Request packets, response packets, and flow control information are all multiplexed and sent across the same physical pins
 - Supports both Host/Peripheral and Peer to Peer communication
- Simple Block Code Packet Formatting (8b/10b)
- In Band Flow Control
 - No extra pins needed
 - Allows receiver to momentarily throttle back transmitter when overflow is about to occur
 - Uses built in special code capability of block code to seamlessly interleave flow control information with user data
 - Allows system designer to balance cost of data buffering versus performance
- Multiple outstanding transactions
- Automatic packet formatting optimizations
- Internal loop-back mode

		MIN	MAX	
1	$t_{d(VCLKH-TXD I)}$	Delay time, VLYNQ_CLK high to VLYNQ_TXD[3:0] invalid	2.25	ns
2	$t_{d(VCLKH-TXD V)}$	Delay time, VLYNQ_CLK high to VLYNQ_TXD[3:0] valid	12	ns

Table 6-80. Timing Requirements for Receive Data for the VLYNQ Module⁽¹⁾ (see Figure 6-46)

NO.				-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
				MIN	MAX	
3	$t_{su(RXDV-VCLKH)}$	Setup time, VLYNQ_RXD[3:0] valid before VLYNQ_CLK high	RTM disabled, RTM sample = 3	1.75		ns
			RTM enabled	(1)		ns
4	$t_{h(VCLKH-RXDV)}$	Hold time, VLYNQ_RXD[3:0] valid after VLYNQ_CLK high	RTM disabled, RTM sample = 3	3		ns
			RTM enabled	(1)		ns

(1) The VLYNQ receive timing manager (RTM) is a serial receive logic designed to eliminate setup and hold violations that could occur in traditional input signals. RTM logic automatically selects the setup and hold timing from one of eight data flops (see Table 6-81). When RTM logic is disabled, the setup and hold timing from the default data flop (3) is used.

Table 6-81. RTM RX Data Flop Hold/Setup Timing Constraints (Typical Values)

RX Data Flop	HOLD (Y)	SETUP (X)
0	1.3	0.9
1	1.4	0.7
2	1.5	-0.4
3	1.6	-0.6
4	1.8	-0.8
5	2.0	-1.0
6	2.2	-1.1
7	2.4	-1.2

Figure 6-46. VLYNQ Transmit/Receive Timing

6.20 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register can control the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts and EDMA events in different interrupt/event generation modes. The GPIO peripheral provides generic connections to external devices. The GPIO pins are grouped into banks of 16 pins per bank (i.e., bank 0 consists of GP[0:15]).

The C6421 GPIO peripheral supports the following:

- Up to 111 3.3-V GPIO pins, GP[0:110]
- Interrupts:
 - Up to 8 unique GP[0:7] interrupts from Bank 0
 - 7 GPIO bank (aggregated) interrupt signals from each of the 7 banks of GPIOs
 - Interrupts can be triggered by rising and/or falling edge, specified for each interrupt capable GPIO signal
- DMA events:
 - Up to 8 unique GPIO DMA events from Bank 0
 - 7 GPIO bank (aggregated) DMA event signals from each of the 7 banks of GPIOs
- Set/clear functionality: Firmware writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple firmware processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate Input/Output registers
- Output register in addition to set/clear so that, if preferred by firmware, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic be implemented.

The memory map for the GPIO registers is shown in [Table 6-82](#). For more detailed information on GPIOs, see the *TMS320C642x DSP General-Purpose Input/Output (GPIO) User's Guide* (literature number SPRUEM8).

0x01C6 70B0 - 0x01C6 7FFF	-	Reserved

6.20.2 GPIO Peripheral Input/Output Electrical Data/Timing

Table 6-83. Timing Requirements for GPIO Inputs⁽¹⁾ (see Figure 6-47)

NO.			-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
			MIN	MAX	
1	$t_{w(GPIH)}$	Pulse duration, GP[x] input high	$2C^{(2)}$		ns
2	$t_{w(GPIL)}$	Pulse duration, GP[x] input low	$2C^{(2)}$		ns

- (1) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have C6421 recognize the GP[x] input changes through software polling of the GPIO register, the GP[x] input duration must be extended to allow C6421 enough time to access the GPIO register through the internal bus.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

Table 6-84. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs (see Figure 6-47)

NO.	PARAMETER	-7/-6/-5/-4 -L/-Q6/-Q5/-Q4		UNIT
		MIN	MAX	
3	$t_{w(GPOH)}$	$2C^{(1)(2)}$		ns
4	$t_{w(GPOL)}$	$2C^{(1)(2)}$		ns

- (1) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.
- (2) C = SYSCLK3 period in ns. For example, when running parts at 600 MHz, use C = 10ns.

Figure 6-47. GPIO Port Timing

6.21 IEEE 1149.1 JTAG

The JTAG⁽³⁾ interface is used for BSDL testing and emulation of the C6421 device.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. Note: $\overline{\text{TRST}}$ is synchronous and **must** be clocked by TCK; otherwise, the boundary scan logic may not respond as expected after $\overline{\text{TRST}}$ is asserted.

For maximum reliability, C6421 includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the device's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of a pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the device after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

6.21.1 JTAG ID (JTAGID) Register Description(s)

(3) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

Table 6-85. JTAG ID Register

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0x01C4 0028	JTAGID	JTAG Identification Register	Read-only. Provides 32-bit JTAG ID of the device.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the C6421 device, the JTAG ID register resides at address location 0x01C4 0028. For the actual register bit names and their associated bit field descriptions, see [Figure 6-48](#) and [Table 6-86](#).

31-28	27-12	11-1	0
VARIANT (4-Bit)	PART NUMBER (16-Bit)	MANUFACTURER (11-Bit)	LSB
R-n	R-1011 0111 0010 0001	R-0000 0010 111	R-1

LEGEND: R = Read, W = Write, n = value at reset

Figure 6-48. JTAG ID (JTAGID) Register—0x01C4 0028

Table 6-86. JTAG ID Register Selection Bit Descriptions

BIT	NAME	DESCRIPTION
31:28	VARIANT	Variant (4-Bit) value. A read from this field always returns 0b0000.
27:12	PART NUMBER	Part Number (16-Bit) value. C6421 value: 1011 0111 0010 0001.
11-1	MANUFACTURER	Manufacturer (11-Bit) value. C6421 value: 0000 0010 111.
0	LSB	LSB. This bit is read as a "1" for C6421.

6.21.2 JTAG Electrical Data/Timing

Table 6-87. Timing Requirements for JTAG Test Port (see Figure 6-49)

2	R θ_{JB}	Junction-to-board	16.0	N/A
3			26.6	0.00
4	R θ_{JA}	Junction-to-free air	21.9	1.0
5			20.4	2.00
7			0.0	0.00
8	Psi $_{JT}$	Junction-to-package top	0.1	1.0
9			0.2	2.00
11			15.9	0.00
12	Psi $_{JB}$	Junction-to-board	15.8	1.0
13			15.3	2.00

(1) The junction-to-case measurement was conducted in a JEDEC defined 1S0P system. Other measurements were conducted in a JEDEC defined 1S2P system and will change based on environment as well as application.

For more information, see these three EIA/JEDEC standards:

- EIA/JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- EIA/JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*

(2) m/s = meters per second

7.1.1 Thermal Data for ZDU

Table 7-2. Thermal Resistance Characteristics (PBGA Package) [ZDU]

NO.			°C/W ⁽¹⁾	AIR FLOW (m/s) ⁽²⁾
1	R θ _{JC}	Junction-to-case	7.7	N/A
2	R θ _{JB}	Junction-to-board	10.5	N/A
3	R θ _{JA}	Junction-to-free air	19.7	0.00

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZWT (S-PBGA-N361)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. This is a Pb-free solder ball design.
 - D. Falls within JEDEC MO-275.

ZDU (S-PBGA-N376)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Falls within JEDEC MO-151
 - D. Thermally enhanced molded plastic package with heat slug (HSL).
 - E. This is a lead-free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
