

OMAP™

OMAP4470
Multimedia Device
Engineering Sample ES1.0
Version A

Data Manual

Public Version

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Literature Number: SWPS048A
August 2012–Revised January 2013

WARNING: EXPORT NOTICE

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from Disclosing party under this Agreement, or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorisation from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws. This provision shall survive termination or expiration of this Agreement.

According to our best knowledge of the state and end-use of this product or technology, and in compliance with the export control regulations of dual-use goods in force in the origin and exporting countries, this technology is classified as follows:

US ECCN: 3E991

EU ECCN: EAR99

And may require export or re-export license for shipping it in compliance with the applicable regulations of certain countries.

Check for Samples: [OMAP4470](#)

1 Introduction

NOTE

OMAP™ 4 processors are intended for manufacturers of Smartphones and other mobile devices, as well as enterprise, industrial, and consumer markets.

This Data Manual describes the electrical and mechanical specifications of the OMAP4470 processor. It consists of the following sections:

- A description of the device terminals: ball assignments, electrical characteristics, multiplexing modes, and signal descriptions ([Section 2](#))
- A presentation of the required electrical characteristics: absolute maximum ratings, operating conditions, dc characteristics, voltage decoupling capacitances, and device power-up, power-down and power-off sequences ([Section 3](#))
- The clock specifications: characteristics of the input and output clocks, PLL and DLL specifications ([Section 4](#))
- The timing requirements and switching characteristics (ac timings) of the interfaces ([Section 5](#))
- A description of the thermal management, thermal resistance characteristics ([Section 6](#))
- A description of the device nomenclature and mechanical data ([Section 7](#))
- The OMAP4470 processor multimedia device PCB guideline ([Section A](#))
- A glossary of the acronyms and abbreviations used in the Data Manual ([Section B](#))

1.1 About This Manual

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Information About Cautions and Warnings

This book may contain cautions and warnings.

CAUTION

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

WARNING

This is an example of a warning statement.

A warning statement describes a situation that could potentially cause harm to you.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

1.2 OMAP4470 MIPI® Disclaimer

The material contained herein is not a license, either expressly or impliedly, to any IPR owned or controlled by any of the authors or developers of this material or MIPI. The material contained herein is provided on an “AS IS” basis and to the maximum extent permitted by applicable law, this material is provided AS IS AND WITH ALL FAULTS, and the authors and developers of this material and MIPI hereby disclaim all other warranties and conditions, either express, implied or statutory, including, but not limited to, any (if any) implied warranties, duties or conditions of merchantability, of fitness for a particular purpose, of accuracy or completeness of responses, of results, of workmanlike effort, of lack of viruses, and of lack of negligence.

ALSO, THERE IS NO WARRANTY OF CONDITION OF TITLE, QUIET ENJOYMENT, QUIET POSSESSION, CORRESPONDENCE TO DESCRIPTION OR NON-INFRINGEMENT WITH REGARD TO THIS MATERIAL OR THE CONTENTS OF THIS DOCUMENT. IN NO EVENT WILL ANY AUTHOR OR DEVELOPER OF THIS MATERIAL OR THE CONTENTS OF THIS DOCUMENT OR MIPI BE LIABLE TO ANY OTHER PARTY FOR THE COST OF PROCURING SUBSTITUTE GOODS OR SERVICES, LOST PROFITS, LOSS OF USE, LOSS OF DATA, OR ANY INCIDENTAL, CONSEQUENTIAL, DIRECT, INDIRECT, OR SPECIAL DAMAGES WHETHER UNDER CONTRACT, TORT, WARRANTY, OR OTHERWISE, ARISING IN ANY WAY OUT OF THIS OR ANY OTHER AGREEMENT, SPECIFICATION OR DOCUMENT RELATING TO THIS MATERIAL, WHETHER OR NOT SUCH PARTY HAD ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

Without limiting the generality of this Disclaimer stated above, the user of the contents of this Document is further notified that MIPI: (a) does not evaluate, test or verify the accuracy, soundness or credibility of the contents of this Document; (b) does not monitor or enforce compliance with the contents of this Document; and (c) does not certify, test, or in any manner investigate products or services or any claims of compliance with the contents of this Document.

2 Terminal Description

2.1 Terminal Assignments

Figure 2-1 and Figure 2-2 show the ball locations for the 547-ball plastic ball grid array (PBGA) package and are used in conjunction with all tables in this chapter to locate signal names and ball grid numbers.

Figure 2-1. S-PBGA-N547 Package (Bottom View)

NOTE

The following bottom balls are unconnected: A28 / B1 / B28.

These balls can be connected to VSS if desired.

NOTE

The following bottom balls are reserved: C5 / C6 / D3 / D4 / D5 / D6 / K21 / K22 / L22 / N7 / T21 / J7 / A2 / B7 / C7 / D7 / H15.

These balls must be left unconnected.

Figure 2-2. S-PBGA-N547 Package (Top View)

NOTE

The following top balls are unconnected: A1 / A29 / AJ1 / AJ29.

2.2 Ball Characteristics

Table 2-1 describes the terminal characteristics and the signals multiplexed on each ball. The following list describes the table column headers:

1. **BALL BOTTOM:** Ball number(s) on the bottom side associated with each signal(s) on the bottom.
2. **BALL TOP:** Ball number(s) on the top side associated with each signal(s) on the top.
3. **PIN NAME:** Names of signals multiplexed on each ball (also notice that the name of the pin is the signal name in mode 0).

NOTE

Table 2-1 does not take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in Section 2.4, Signal Descriptions.

NOTE

In the safe_mode, the buffer is configured in high-impedance.

4. **MODE:** Multiplexing mode number:
- (a) Mode 0 is the primary mode; this means that when mode 0 is set, the function mapped on the ball corresponds to the name of the ball. There is always a function mapped on the primary mode. The primary mode is not necessarily the default mode.

NOTE

The default mode is the mode at the release of the reset; also see the RESET REL. MODE column.

- (b) Modes 1 to 7 are possible modes for alternate functions. On each ball, some modes are effectively used for alternate functions, while some modes are not used and correspond to a safe mode per design implementation.
5. **TYPE:** Signal type and direction:
- I = Input
 - O = Output
 - I/O = Input/Output
 - D = Open drain
 - DS = Differential
 - A = Analog
 - PWR = Power
 - GND = Ground
6. **BALL RESET STATE:** The state of the terminal at power-on reset:
- 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
 - 0(PD): The buffer drives V_{OL} with an active pulldown resistor.
 - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
 - 1(PU): The buffer drives V_{OH} with an active pullup resistor.
 - Z: High-impedance
 - L: High-impedance with an active pulldown resistor
 - H: High-impedance with an active pullup resistor
7. **BALL RESET REL. STATE:** The state of the terminal at the release of the System Control Module reset (PRCM CORE_PWRON_RET_RST reset signal).
- 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
 - 0(PD): The buffer drives V_{OL} with an active pulldown resistor.
 - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
 - 1(PU): The buffer drives V_{OH} with an active pullup resistor.
 - Z: High-impedance
 - L: High-impedance with an active pulldown resistor
 - H: High-impedance with an active pullup resistor

NOTE

For more information on the CORE_PWRON_RET_RST reset signal and its reset sources, see the Power Reset and Clock Management / PRCM Reset Management Functional Description section of the OMAP4470 TRM.

8. **RESET REL. MODE:** This mode is automatically configured at the release of the System Control Module reset (PRCM CORE_PWRON_RET_RST reset signal).

NOTE

For more information on the CORE_PWRON_RET_RST reset signal and its reset sources, see the Power Reset and Clock Management / PRCM Reset Management Functional Description section of the OMAP4470 TRM.

9. **POWER:** The voltage supply that powers the terminal I/O buffers.
10. **HYS:** Indicates if the input buffer is with hysteresis:
- Yes: With high hysteresis
 - No: Without low hysteresis
-

NOTE

The hysteresis value is equal to minimum 150 mV for 1.8 V, or minimum 135 mV for 1.2 V, unless otherwise specified. For more information, see the hysteresis values in [Section 3.3, DC Electrical Characteristics](#).

11. **BUFFER STRENGTH:** Drive strength of the associated output buffer.
-

NOTE

For programmable buffer strength:

- The default value is given in [Table 2-1](#)
 - A note describes all possible values according to the selected mode.
 - The pin is assured to supply up to this amount in steady-state.
-

12. **PULL U/D – TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
-

NOTE

The pullup/pulldown drive strength is equal to: minimum = 50 μ A, typical = 100 μ A, maximum = 250 μ A, unless otherwise specified.

13. **IO CELL:** IO cell information:

- LVCMOS: The IO buffer receives or drives a standard GPIO signal.
 - Open Drain: The IO buffer outputs an open drain signal.
 - PHY: This is for MIPI D-PHY signals.
 - Analog: For Analog signals
 - SubLVDS: The IO buffer supports the differential mode.
 - Dual Voltage: The IO buffer is designed to support two voltages (for instance, 1.2 V and 1.8 V, or 1.8 V and 3.0 V).
-

NOTE

Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration. (safe_mode is not an input signal.)

NOTE

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, this pad is actually set undriven (high-impedance: Z) with potential pullup or pulldown resistors. Pulls need to be disabled to have a pure high-impedance.

NOTE

All balls not described in [Table 2-1](#) are not connected.

NOTE

In the OMAP4470 device, new far end load settings registers are added for some IOs. This new feature configures the IO according to the transmission line and the application/peripheral load. For a full description on these registers, see the System Control Module / Programming Model / Feature Settings section of the OMAP4470 TRM.

N28 / T1 / T2	P28 / T1 / T2	pop_vdd2_lpddr22	-	PWR	NA	NA	NA	NA	NA	NA	NA	NA

(1) NA stands for Not Applicable.

(2) x and y = 20 to 70 μ A

(3) x and y = 40 to 70 μ A

(4) The cell is provided with the flexibility of selecting optimal voltage level based on the current load requirement among 2 μ A, 4 μ A, 6 μ A, or 8 μ A.

(5) The pullup or pulldown can be either the standard LVCMOS 100- μ A drive strength or the configurable I²C internal pullup resistances. The default buffer configuration is the following:

- PUX/PDY-OD is specified: the default buffer configuration is High-Speed I²C point-to-point mode using internal pullup resistance.
- PUX/PDY-GPIO is specified: the default buffer configuration is standard LVCMOS mode (non-I²C). The internal pullup resistance programming does not apply in this mode.

In I²C mode configuration, for a full description of the internal pullup resistance programming according to the load range, see the CONTROL_I2C_0 and CONTROL_I2C_2 registers in the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

In standard LVCMOS mode configuration (non-I²C mode), for a full description of the pullup or pulldown programming, see the CONTROL_CORE_PADX registers in the Control Module / Control Module Functional Description / Pad Functional Multiplexing and Configuration section of the OMAP4470 TRM.

(6) PAD can be driven low or high impedance by the driver. External pullup is required and can vary between 1 k Ω and 10 k Ω . The circuitry pulling up or pulling down the pad must be able to provide at least 100 μ A of current without collapsing.

(7) PD: 30 k Ω to 150 k Ω . PU: 50 k Ω to 110 k Ω

(8) PD resistance: from 30 k Ω to 150 k Ω .

The pullup resistance is configurable by software programming:

- PUSTRENGTH = 1: PU resistance from 10 k Ω to 50 k Ω
- PUSTRENGTH = 0: PU resistance from 50 k Ω to 110 k Ω

For more information regarding the PUSTRENGTH programming, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment / SDMMC1 Pullup Strength Control section of the OMAP4470 TRM.

(9) The maximum capacitive load for the DSI low-power mode is equal to 60 pF. See Chapter 8 of the MIPI D-PHY standard v1.0 for complete specification on the electrical characteristics.

No specific capacitive load is needed in DSI high-speed mode.

The PCB interconnect must be 50- Ω transmission line on DSI dsi_dx[2:0] and DSI dsi_dy[2:0]. DSI dsi_dx[2:0] and DSI dsi_dy[2:0] lines must be well matched. See Chapter 7 of the MIPI D-PHY standard v1.0 for complete specification of the interconnect.

(10) The buffer strength of this IO cell is programmable (2.5, 5, 7.5, or 10 mA); the default value is described in the table above.

- (11) IO drive strength for D+ (usba0_otg_dp) and D– (usba0_otg_dm): minimum 18.3 mA, maximum 89 mA (for a power supply vdda_usba0otg_3p3v = 3.6 V).
Ball characteristics are compliant with USB2.0.
- (12) PU = minimum 900 Ω , maximum 3.090 k Ω and PD = minimum 14.25 k Ω , maximum 24.8 k Ω . Note that:
- PU is typically connected for D+ (usba0_otg_dp) in Full-Speed mode and for D– (usba0_otg_dm) in Low-Speed mode.
 - PD is typically connected for D+ (usba0_otg_dp) and D– (usba0_otg_dm) whatever the modes. PD is connected to both D+ and D– only if OMAP4 is used as HOST.
- Ball characteristics are compliant with USB2.0.
- (13) For H2 / H3 / H4 / D2 / E3 / E4 / E2 / E1 / F4 / F3 / F1 / G2 / G4 / G3 / J2 balls, the hysteresis value is equal to 100 mV minimum for 1.8 V (vdds_mmc1 or OMAP4470 following the interface used), or 50 mV minimum for 3.0 V (vdds_mmc1 following the interface used).
- (14) The buffer drive strength is configurable by software programming:
- Mode 2: DS0 = 0, impedance = 50 Ω (buffer drive strength = 4 mA, I_{OL} = I_{OH} = 4 mA)
 - Mode 1: DS0 = 1, impedance = 25 Ω (buffer drive strength = 8 mA, I_{OL} = I_{OH} = 8 mA)
- In the BUFFER STRENGTH (mA) [11] column is defined the value by default.
For more information regarding the DS0 programming, see the CONTROL_SMART2IO_PADCONF_2 register in the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.
For more information regarding the load, rise / fall times vs frequency depending the modes (DS0 = 0 or 1) or the supply voltage value (1.2-V or 1.8-V), see [Table 3-4, GPMC DC Electrical Characteristics](#).
- (15) For AE18 / AG12 balls, the hysteresis value is equal to 70 mV minimum for 1.8 V and 60 mV minimum for 1.2 V. For P2 / V2 balls, the hysteresis value is equal to 70 mV minimum for 1.8 V.
- (16) For more information regarding the MIPI D-PHY hysteresis, see [Section 3.3.3, Camera DC Electrical Characteristics](#), [Section 3.3.4, Display DC Electrical Characteristics](#).
- (17) For B5 / B4 balls, the hysteresis is:
- In low-speed and full-speed single-ended receiver modes: minimum 20 mV, typical 50 mV, maximum 80 mV
 - In differential receiver modes, no hysteresis feature is present.
- (18) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.
- (19) IO drive strength for usba0_otg_ce ball: minimum 100 μ A, maximum 20 mA.
- (20) If a CSI2 serial PHY is enabled, vdda_csi2 must be supplied by a dedicated 1.8-V low-noise power source.
If a CSI2 serial PHY is definitively disabled, other multiplexed 1.8-V CMOS signals of the interface can be enabled, the interface can be supplied by the same power source as vdds_1p8v: the vdds_1p8v power source supplies vdda_csi2 ball.
If CSI2 serial PHY and CMOS signals are definitively disabled, the interface balls are left unconnected with its associated power supply (vdda/vssa) grounded (for circuit reliability reasons).
- (21) If a DSI serial PHY is enabled, vdda_dsi must be supplied by a dedicated 1.8-V low-noise power source.
If a DSI serial PHY is definitively disabled, the interface balls are left unconnected and in that case the associated power supply (vdda/vssa) can be grounded (for circuit reliability reasons) only if the corresponding DSI DPLL is never used to generate the functional clock to the DISPC.
- (22) If the HDMI serial PHY is enabled, vdda_hdmi must be supplied by a dedicated 1.8-V low-noise power source.
If the HDMI serial PHY is definitively disabled, the interface balls are left unconnected with its associated power supply (vdda/vssa) grounded (for circuit reliability reasons).
- (23) If the HS USB OTG PHY is enabled, vdda_usba0otg_3p3v and vdda_usba0otg_1p8v must be supplied by dedicated 3.3-V and 1.8-V low-noise power sources.
If the USB OTG PHY is definitively disabled, other multiplexed 3.3-V CMOS signals of the interface can be enabled, vdda_usba0otg_3p3v must be supplied by a dedicated 3.3-V power source and vdda_usba0otg_1p8v can be supplied by the same power source as vdds_1p8v.
If the USB OTG PHY and CMOS signals are definitively disabled, vdda_usba0otg_3p3v and vdda_usba0otg_1p8v are grounded for power saving and there is a forward-biased diode from usba0_otg_dp, usba0_otg_dm, usba0_otg_ce balls to vdda_usba0otg_3p3v ball.
- (24) If the SDMMC1 functional signals are enabled, vdds_sdmmc1 must be supplied by either dedicated 1.8-V or 3.0-V power source.
If the SDMMC1 functional signals are definitively disabled, other multiplexed 1.8-V CMOS signals of the interface can be enabled, the interface can be supplied by the same power source as vdds_1p8v: the vdds_1p8v power source supplies vdds_sdmmc1.
If the SDMMC1 functional balls and CMOS signals are definitively disabled, the interface balls are left unconnected and MMC1_PWRDNZ and MMC1_PBIASLITE_PWRDNZ bits are kept at 0. There are two options for the associated power supply:
- vdds_sdmmc1 is grounded.
 - vdds_sdmmc1 is supplied by a 1.8-V or 3.0-V supply. In this case, it is also recommended to keep default value of MMC1_PBIASLITE_VMODE bit (that is, 1).
- For the corresponding setting of the MMC1_PWRDNZ, MMC1_PBIASLITE_PWRDNZ, and MMC1_PBIASLITE_VMODE bits, see the Control Module / Control Module Functional Description / Extended-Drain I/O and PBIAS Cell section and the Control Module / Control Module Programming Guide section of the OMAP4470 TRM.
- (25) In the device, the number “2” in the cam2 interface name does not mean there are two camera parallel interfaces available in the device. The cam2 interface name defines the camera parallel interface available in the device vs the legacy device.
- (26) The function (data or clock) supported on each lane is programmable. More information on HDMI is not available in the public domain.

- (27) The HDMI pulldown resistor is only enabled when the HDMI supply is either ramping or off. Hence, this pulldown resistor is not linked to the HDMI standard protocol.
- (28) This ball must be left unconnected.
- (29) pop_vacc_lpdrr2 must be left unconnected.

2.3 Multiplexing Characteristics

Table 2-2 describes the device multiplexing (no characteristics are available in this table).

NOTE

This table doesn't take into account subsystem multiplexing signals. Subsystem multiplexing signals are described in [Section 2.4, Signal Descriptions](#).

NOTE

For more information, see the Control Module / Control Module Functional Description / PAD Functional Multiplexing and Configuration section of the OMAP4470 TRM.

NOTE

Configuring two balls to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration. (safe_mode is not an input signal.)

NOTE

When a pad is set into a multiplexing mode which is not defined by ball multiplexing, this pad is actually set undriven (Hi-Z) with potential pullup / pulldown. Pulls need to be disabled to have a pure Hi-Z.

NOTE

All balls not described in [Table 2-1](#) and [Table 2-2](#) are not connected.

(1) In safe_mode the ball is configured as a high impedance input; the ball is also floating (unconnected to modules).

(2) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.

(3) atestv, iforce, and vsense balls must be left unconnected.

The following bottom balls are reserved: C5 / C6 / D3 / D4 / D5 / D6 / L22 / N7. These balls must be left unconnected.

(4) In the device, the number "2" in the cam2 interface name does not mean there are two camera parallel interfaces available in the

device. The cam2 interface name defines the camera parallel interface available in the device vs the legacy device.

- (5) This ball must be left unconnected.
- (6) pop_vacc_lpdrr2 must be left unconnected.

2.4 Signal Descriptions

Many signals are available on multiple balls, according to the software configuration of the ball multiplexing options.

1. **SIGNAL NAME:** The name of the signal passing through the pin.
-

NOTE

The subsystem multiplexing signals are not described in [Table 2-1](#) and [Table 2-2](#).

2. **DESCRIPTION:** Description of the signal
3. **TYPE:** Type = Signal direction and type:
 - I = Input
 - O = Output
 - IO = Input / output
 - D = Open Drain
 - DS = Differential
 - A = Analog
 - PWR = Power
 - GND = Ground
4. **BALL BOTTOM:** Associated ball(s) bottom
5. **BALL TOP:** Associated ball(s) top
6. **PIN NAME:** This is the name of the pin the signal is passing through.

2.4.1 External Memory Interfaces

2.4.1.1 GPMC

NOTE

For more information, see the Memory Subsystem / General-Purpose Memory Controller section of the OMAP4470 TRM.

2.4.2 Video Interfaces

2.4.2.1 Camera

NOTE

For more information, see the Imaging Subsystem / ISS Interfaces section of the OMAP4470 TRM.

2.4.2.1.1 Camera Control

Table 2-5. Camera Control Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
cam_shutter	Camera mechanical shutter control	O	T27 / G27	-
cam_strobe	Camera flash activation trigger	O	U27 / G28	-
cam_globalreset	Camera sensor reset	IO	V27 / F28	-

2.4.2.1.2 Camera Parallel

Table 2-6. Camera Parallel Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
cam2_d0 ⁽¹⁾	Camera parallel data 0	I	N25 / G26	-
cam2_d1 ⁽¹⁾	Camera parallel data 1	I	N26 / G25	-
cam2_d2 ⁽¹⁾	Camera parallel data 2	I	M25 / H26	-
cam2_d3 ⁽¹⁾	Camera parallel data 3	I	M26 / H25	-
cam2_d4 ⁽¹⁾	Camera parallel data 4	I	W25 / J26	-
cam2_d5 ⁽¹⁾	Camera parallel data 5	I	W26 / J25	-
cam2_d6 ⁽¹⁾	Camera parallel data 6	I	V25 / K26	-
cam2_d7 ⁽¹⁾	Camera parallel data 7	I	V26 / K25	-
cam2_d8 ⁽¹⁾	Camera parallel data 8	I	J27	-
cam2_d9 ⁽¹⁾	Camera parallel data 9	I	L27	-
cam2_d10 ⁽¹⁾	Camera parallel data 10	I	H27	-
cam2_d11 ⁽¹⁾	Camera parallel data 11	I	K27	-
cam2_d12 ⁽¹⁾	Camera parallel data 12	I	M26	-
cam2_d13 ⁽¹⁾	Camera parallel data 13	I	M25	-
cam2_d14 ⁽¹⁾	Camera parallel data 14	I	N26	-
cam2_d15 ⁽¹⁾	Camera parallel data 15	I	N25	-
cam2_fid ⁽¹⁾	Camera parallel field identification for interlaced sensors (i mode)	I	N27	-
cam2_wen ⁽¹⁾	Camera parallel external write enable	I	M27	-
cam2_hs ⁽¹⁾	Camera horizontal synchronization	I	T27	-
cam2_vs ⁽¹⁾	Camera vertical synchronization	I	U27	-
cam2_pclk ⁽¹⁾	Camera pixel clock	I	V27	-

(1) In the device, the number "2" in the cam2 interface name does not mean there are two camera parallel interfaces available in the device. The cam2 interface name defines the camera parallel interface available in the device vs the legacy device.

2.4.2.1.3 CSI21

Table 2-7. CSI21 Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
csi21_dx0	CSI2 (CSI21) camera lane 0 differential x	IDS	R26	-

Table 2-7. CSI21 Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
csi21_dy0	CSI2 (CSI21) camera lane 0 differential y	IDS	R25	-
csi21_dx1	CSI2 (CSI21) camera lane 1 differential x	IDS	T26	-
csi21_dy1	CSI2 (CSI21) camera lane 1 differential y	IDS	T25	-
csi21_dx2	CSI2 (CSI21) camera lane 2 differential x	IDS	U26	-
csi21_dy2	CSI2 (CSI21) camera lane 2 differential y	IDS	U25	-
csi21_dx3	CSI2 (CSI21) camera lane 3 differential x	IDS	V26	-
csi21_dy3	CSI2 (CSI21) camera lane 3 differential y	IDS	V25	-
csi21_dx4	CSI2 (CSI21) camera lane 4 differential x	IDS	W26	-
csi21_dy4	CSI2 (CSI21) camera lane 4 differential y	IDS	W25	-

2.4.2.1.4 CSI22 (CCP2)**Table 2-8. CSI22 Signal Descriptions**

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
csi22_dx0	CSI2 (CSI22) camera lane 0 differential x	IDS	M26	-
csi22_dy0	CSI2 (CSI22) camera lane 0 differential y	IDS	M25	-
csi22_dx1	CSI2 (CSI22) camera lane 1 differential x	IDS	N26	-
csi22_dy1	CSI2 (CSI22) camera lane 1 differential y	IDS	N25	-
csi22_dx2	CSI2 (CSI22) camera lane 2 differential x	IDS	N27	-
csi22_dy2	CSI2 (CSI22) camera lane 2 differential y	IDS	M27	-

2.4.2.2 Display**NOTE**

For more information, see the Display Subsystem / Display Subsystem Overview / DSS Environment section of the OMAP4470 TRM.

2.4.2.2.1 RFBI**Table 2-9. RFBI Signal Descriptions**

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
rfbi_data0	RFBI data bit 0	IO	AC4	-
rfbi_data1	RFBI data bit 1	IO	AB4	-
rfbi_data2	RFBI data bit 2	IO	AB3	-
rfbi_data3	RFBI data bit 3	IO	AB2	-

dsi2_te0	DSI1_2 tearing effect input 0	IDS	C23 / C24 / AB4	-
dsi2_te1	DSI1_2 tearing effect input 1	IDS	B26 / D24 / AC4	-

2.4.2.2.4 HDMI**Table 2-12. HDMI Signal Descriptions**

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
hdmi_cec	HDMI consumer electronic control	IO	B10	-
hdmi_hpd	HDMI display hot plug detect	I	B9	-
hdmi_ddc_scl	HDMI display data channel clock	IOD	A8	-
hdmi_ddc_sda	HDMI display data channel data	IOD	B8	-

Table 2-12. HDMI Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
hdmi_data0x ⁽¹⁾	HDMI data 0 differential positive or negative	ODS	C10	-
hdmi_data0y ⁽¹⁾	HDMI data 0 differential positive or negative	ODS	D10	-
hdmi_data1x ⁽¹⁾	HDMI data 1 differential positive or negative	ODS	C9	-
hdmi_data1y ⁽¹⁾	HDMI data 1 differential positive or negative	ODS	D9	-
hdmi_data2x ⁽¹⁾	HDMI data 2 differential positive or negative	ODS	C8	-
hdmi_data2y ⁽¹⁾	HDMI data 2 differential positive or negative	ODS	D8	-
hdmi_clockx ⁽¹⁾	HDMI clock differential positive or negative	ODS	C11	-
hdmi_clocky ⁽¹⁾	HDMI clock differential positive or negative	ODS	D11	-

(1) The function (data or clock) supported on each lane is programmable. More information on HDMI is not available in the public domain.

2.4.2.2.5 DISPC

Table 2-13. DISPC Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
dispc2_data0	DISPC data to LCD2 panel - data bit 0	O	AC4	-
dispc2_data1	DISPC data to LCD2 panel - data bit 1	O	AB4	-
dispc2_data2	DISPC data to LCD2 panel - data bit 2	O	AB3	-
dispc2_data3	DISPC data to LCD2 panel - data bit 3	O	AB2	-
dispc2_data4	DISPC data to LCD2 panel - data bit 4	O	AA4	-
dispc2_data5	DISPC data to LCD2 panel - data bit 5	O	AA3	-
dispc2_data6	DISPC data to LCD2 panel - data bit 6	O	AA2	-
dispc2_data7	DISPC data to LCD2 panel - data bit 7	O	AA1	-
dispc2_data8	DISPC data to LCD2 panel - data bit 8	O	Y4	-
dispc2_data9	DISPC data to LCD2 panel - data bit 9	O	V2	-
dispc2_data10	DISPC data to LCD2 panel - data bit 10	O	V1	-
dispc2_data11	DISPC data to LCD2 panel - data bit 11	O	AE9	-
dispc2_data12	DISPC data to LCD2 panel - data bit 12	O	AG10	-
dispc2_data13	DISPC data to LCD2 panel - data bit 13	O	AF10	-
dispc2_data14	DISPC data to LCD2 panel - data bit 14	O	AE10	-
dispc2_data15	DISPC data to LCD2 panel - data bit 15	O	AH11	-
dispc2_data16	DISPC data to LCD2 panel - data bit 16	O	W1	-
dispc2_data17	DISPC data to LCD2 panel - data bit 17	O	W2	-
dispc2_data18	DISPC data to LCD2 panel - data bit 18	O	AG11	-
dispc2_data19	DISPC data to LCD2 panel - data bit 19	O	AF11	-
dispc2_data20	DISPC data to LCD2 panel - data bit 20	O	AE11	-
dispc2_data21	DISPC data to LCD2 panel - data bit 21	O	AG13	-
dispc2_data22	DISPC data to LCD2 panel - data bit 22	O	AE12	-
dispc2_data23	DISPC data to LCD2 panel - data bit 23	O	AF12	-
dispc2_hsync	DISPC horizontal synchronization from dispc to LCD2	O	W3	-
dispc2_vsync	DISPC vertical synchronization from dispc to LCD2	O	Y2	-
dispc2_de	DISPC ac bias output enable or data enable to LCD2	O	Y3	-
dispc2_pclk	DISPC LCD pixel clock to LCD2	O	W4	-
dispc2_fid	DISPC field ID to LCD2	O	P2	-

2.4.3 Serial Communication Interfaces

2.4.3.1 HDQ/1-Wire

NOTE

For more information, see the Serial Communication Interface / HDQ/1-Wire section of the OMAP4470 TRM.

Table 2-14. HDQ/1-Wire Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
hdq_sio	HDQ™ 1-Wire® control and data interface	IOD	AA27	-

2.4.3.2 I²C

NOTE

For more information, see the Serial Communication Interface / Multimaster High-Speed I²C Controller / HS I²C Environment / HS I²C in I²C Mode section of the OMAP4470 TRM.

Table 2-15. I²C Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Inter-Integrated Circuit Interface (I2C1)				
i2c1_scl	I2C1 clock	OD	AE28	-
i2c1_sda	I2C1 data	IOD	AE26	-
Inter-Integrated Circuit Interface (I2C2)				
i2c2_scl	I2C2 clock	OD	C26	-
i2c2_sda	I2C2 data	IOD	D26	-
i2c2_sccb	I2C2 serial camera control bus	OD	AA27	-
Inter-Integrated Circuit Interface (I2C3)				
i2c3_scl	I2C3 clock	OD	W27	-
i2c3_sda	I2C3 data	IOD	Y27	-
i2c3_sccb	I2C3 serial camera control bus	OD	AA27	-
Inter-Integrated Circuit Interface (I2C4)				
i2c4_scl	I2C4 clock	OD	AG21	-
i2c4_sda	I2C4 data	IOD	AH22	-

2.4.3.3 SmartReflex™

NOTE

For more information, see:

- The Power, Reset and Clock Management / Device Power Management Introduction / Device Power-Management Architecture Building Blocks / Voltage Management / AVS Overview section or
 - The Power, Reset and Clock Management / PRCM Subsystem Environment / External Power Control Signals section
- of the OMAP4470 TRM.
-

Table 2-16. SmartReflex Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
sr_scl	Smart-Reflex clock	OD	AG9	-
sr_sda	Smart-Reflex data	IOD	AF9	-

2.4.3.4 McBSP**NOTE**

For more information, see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) section of the OMAP4470 TRM.

Table 2-17. McBSP1, 2, 3 Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
Audio Backend Multichannel Buffered Serial Port (ABE McBSP1)				
abe_mcbasp1_dr	ABE McBSP1 received serial data	I	AC25	-
abe_mcbasp1_dx	ABE McBSP1 transmitted serial data	IO	AB25	-
abe_mcbasp1_clkx	ABE McBSP1 combined serial clock	IO	AC26	-
abe_mcbasp1_fsx	ABE McBSP1 combined frame synchronization	IO	AC27	-
Audio Backend Multichannel Buffered Serial Port (ABE McBSP2)				
abe_mcbasp2_dr	ABE McBSP2 received serial data	I	AD26	-
abe_mcbasp2_dx	ABE McBSP2 transmitted serial data	IO	AD25	-
abe_mcbasp2_clkx	ABE McBSP2 combined serial clock	IO	AD27	-
abe_mcbasp2_fsx	ABE McBSP2 combined frame synchronization	IO	AC28	-
Audio Backend Multichannel Buffered Serial Port (ABE McBSP3)				
abe_mcbasp3_dr	ABE McBSP3 received serial data	I	AH17 / AG25	-
abe_mcbasp3_dx	ABE McBSP3 transmitted serial data	IO	AE16 / AF25	-
abe_mcbasp3_clkx	ABE McBSP3 combined serial clock	IO	AF16 / AE25	-
abe_mcbasp3_fsx	ABE McBSP3 combined frame synchronization	IO	AG16 / AF26	-

Table 2-18. McBSP4 Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
mcbasp4_dr	McBSP4 received serial data	I	AE17	-
mcbasp4_dx	McBSP4 transmitted serial data	IO	AG18	-
mcbasp4_clkx	McBSP4 transmitted serial clock	IO	AF18	-
mcbasp4_fsx	McBSP4 transmitted frame synchronization	IO	AE19	-
mcbasp4_clkcr	McBSP4 received serial clock	IO	AG19	-
mcbasp4_fsr	McBSP4 received frame synchronization	IO	AF19	-

2.4.3.5 PDM**NOTE**

For more information, see the Serial Communication Interface / Multichannel PDM Controller section of the OMAP4470 TRM.

Table 2-19. ABE McPDM Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
abe_pdm_ul_data	ABE PDM data stream from TWL6032 PMIC to OMAP4470	I	AG25	-
abe_pdm_dl_data	ABE PDM data stream from OMAP4470 to TWL6032 PMIC	O	AF25	-
abe_pdm_frame	ABE PDM Frame synchronization	IO	AE25	-
abe_pdm_lb_clk	ABE PDM loop back clock	O	AF26	-

2.4.3.6 DMIC

NOTE

For more information, see the Serial Communication Interface / Digital Microphone Module section of the OMAP4470 TRM.

Table 2-20. ABE DMIC Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
abe_dmic_clk1	ABE digital microphone clock output 1	O	AE24	-
abe_dmic_clk2	ABE digital microphone clock output 2	O	AH24	-
abe_dmic_clk3	ABE digital microphone clock output 3	O	AG16	-
abe_dmic_din1	ABE digital microphone data input 1	I	AF24	-
abe_dmic_din2	ABE digital microphone data input 2	I	AG24	-
abe_dmic_din3	ABE digital microphone data input 3	I	AF16 / AH24	-

2.4.3.7 McASP

NOTE

For more information, see the Serial Communication Interface / Multichannel Audio Serial Port section of the OMAP4470 TRM.

Table 2-21. ABE McASP Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
abe_mcaspx_axr	ABE McASP serial data IO	IO	AD26 / AG24	-
abe_mcaspx_aclkx	ABE McASP clock transmit	O	AB25	-
abe_mcaspx_afx	ABE McASP frame synchronization transmit	O	AC28	-
abe_mcaspx_ahclkx	ABE McASP high frequency clock output	O	AD27	-
abe_mcaspx_amutein	ABE McASP auto mute input	I	AC27	-
abe_mcaspx_amute	ABE McASP auto mute output	O	AD25	-

2.4.3.8 SLIMbus®

NOTE

For more information, see the Serial Communication Interface / Serial Low-Power Inter-Chip Media Bus Controller section of the OMAP4470 TRM.

Table 2-22. ABE SLIMbus1 Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
abe_slimbus1_clock	ABE SLIMbus1 clock	IO	AC26	-
abe_slimbus1_data	ABE SLIMbus1 data	IO	AC25	-

Table 2-23. SLIMbus2 Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
abe_clks	ABE clock input	I	AH26	-
slimbus2_clock	SLIMbus2 clock	IO	AG24 / AG23	-
slimbus2_data	SLIMbus2 data	IO	AH24 / AH23	-

2.4.3.9 HSI

NOTE

For more information, see the Serial Communication Interface / MIPI-HSI section of the OMAP4470 TRM.

Table 2-24. HSI Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
High-speed Synchronous Serial Interface (HSI1)				
hsi1_cawake	HSI1 cellular modem to APE wake signal	I	AE18	-
hsi1_cadata	HSI1 cellular modem to APE signal	I	AG19	-
hsi1_caflag	HSI1 cellular modem to APE flag signal	I	AF19	-
hsi1_acready	HSI1 APE to cellular modem ready signal	O	AE19	-
hsi1_acwake	HSI1 APE to cellular modem wake signal	O	AF18	-
hsi1_acdata	HSI1 APE to cellular modem data signal	O	AG18	-
hsi1_acflag	HSI1 APE to cellular modem ready signal	O	AE17	-
hsi1_caready	HSI1 cellular modem to APE ready signal	I	AF17	-
High-speed Synchronous Serial Interface (HSI2)				
hsi2_cawake	HSI2 cellular modem to APE wake signal	I	AG12	-
hsi2_cadata	HSI2 cellular modem to APE signal	I	AF12	-
hsi2_caflag	HSI2 cellular modem to APE flag signal	I	AE12	-
hsi2_acready	HSI2 APE to cellular modem ready signal	O	AG13	-
hsi2_acwake	HSI2 APE to cellular modem wake signal	O	AE11	-
hsi2_acdata	HSI2 APE to cellular modem data signal	O	AF11	-
hsi2_acflag	HSI2 APE to cellular modem ready signal	O	AG11	-
hsi2_caready	HSI2 cellular modem to APE ready signal	I	AH11	-

2.4.3.10 McSPI

NOTE

For more information, see the Serial Communication Interface / Multichannel Serial Port Interface (MCSPI) section of the OMAP4470 TRM.

Table 2-25. McSPI Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Multichannel Serial Port Interface (McSPI1)				
mcspi1_clk	McSPI1 clock (slave input, master output)	IO	AF22	-
mcspi1_somi	McSPI1 data (slave output, master input, Z when not shifting)	IO	AE22	-
mcspi1_simo	McSPI1 data (slave input, master output, Z when not shifting)	IO	AG22	-
mcspi1_cs0	McSPI1 chip select 0 (slave input, master output)	IO	AE23	-
mcspi1_cs1	McSPI1 chip select 1	O	AF23	-
mcspi1_cs2	McSPI1 chip select 2	O	AG23	-
mcspi1_cs3	McSPI1 chip select 3	O	AH23	-
Multichannel Serial Port Interface (McSPI2)				
mcspi2_clk	McSPI2 clock (slave input, master output)	IO	AD27 / AE5	-
mcspi2_somi	McSPI2 data (slave output, master input, Z when not shifting)	IO	AD26 / AE4	-
mcspi2_simo	McSPI2 data (slave input, master output, Z if not shifting)	IO	AD25 / AF5	-
mcspi2_cs0	McSPI2 chip select 0 (slave input, master output)	IO	AC28 / AF3	-
mcspi2_cs1	McSPI2 chip select 1	O	AG3	-
Multichannel Serial Port Interface (McSPI3)				
mcspi3_clk	McSPI3 clock (slave input, master output)	IO	AE9	-
mcspi3_somi	McSPI3 data (slave output, master input, Z when not shifting)	IO	AE10	-
mcspi3_simo	McSPI3 data (slave input, master output, Z if not shifting)	IO	AG10	-
mcspi3_cs0	McSPI3 chip select 0 (slave input, master output)	IO	AF10	-
Multichannel Serial Port Interface (McSPI4)				
mcspi4_clk	McSPI4 clock (slave input, master output)	IO	AE21	-
mcspi4_somi	McSPI4 data (slave output, master input, Z when not shifting)	IO	AF21	-
mcspi4_simo	McSPI4 data (slave input, master output, Z if not shifting)	IO	AF20	-
mcspi4_cs0	McSPI4 chip select 0 (slave input, master output)	IO	AE20	-

2.4.3.11 UART

NOTE

For more information, see the Serial Communication Interface / UART/IrDA/CIR section of the OMAP4470 TRM.

Table 2-26. UART Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Universal Asynchronous Receiver/Transmitter (UART1)				
uart1_cts	UART1 clear to send	I	AG23	-
uart1_rts	UART1 request to send	O	AH23	-
uart1_rx	UART1 receive data	I	E3 / C26 / AF23 / AA3	-
uart1_tx	UART1 transmit data	O	D26 / F27	-
Universal Asynchronous Receiver/Transmitter (UART2)				
uart2_cts	UART2 clear to send	I	AB26	-
uart2_rts	UART2 request to send	O	AB27	-
uart2_rx	UART2 receive data	I	AA25 / B5	-
uart2_tx	UART2 transmit data	O	AA26 / B4	-
Universal Asynchronous Receiver/Transmitter (UART3)				
uart3_cts_rctx	UART3 clear to send or remote control data output	IO	F27 / Y2	-

Table 2-26. UART Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
uart3_rts_sd	UART3 request to send or infrared transceiver shutdown	O	F28 / W4	-
uart3_rx_irrx	UART3 receive data input or infrared data input	I	G27 / B5 / W3	-
uart3_tx_irtx	UART3 transmit data output or infrared data output	O	G28 / B4 / W2	-
Universal Asynchronous Receiver/Transmitter (UART4)				
uart4_rx	UART4 receive data	I	AG20	-
uart4_tx	UART4 transmit data	O	AH19	-
uart4_cts	UART4 clear to send	I	AE24	-
uart4_rts	UART4 request to send	O	AF24	-

2.4.3.12 USB**NOTE**

For more information, see:

- Serial Communication Interface / High-Speed Multiport USB Host Subsystem section, or
- Serial Communication Interface / High-Speed USB OTG Controller section, or
- Serial Communication Interface / Full-Speed USB Host Controller section of the OMAP4470 TRM.

Table 2-27. USB Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Universal Serial Bus (USBA0)				
usba0_ulpiphy_clk	USBA0 IO to/from external transceiver 60-MHz clock	I	P2	-
usba0_ulpiphy_stp	USBA0 output to external transceiver to stop data stream	O	V1	-
usba0_ulpiphy_dir	USBA0 data direction control from external transceiver	I	V2	-
usba0_ulpiphy_nxt	USBA0 next signal control from external transceiver	I	W1	-
usba0_ulpiphy_dat0	USBA0 data bit 0 to/from external transceiver	IO	W2	-
usba0_ulpiphy_dat1	USBA0 data bit 1 to/from external transceiver	IO	W3	-
usba0_ulpiphy_dat2	USBA0 data bit 2 to/from external transceiver	IO	W4	-
usba0_ulpiphy_dat3	USBA0 data bit 3 to/from external transceiver	IO	Y2	-
usba0_ulpiphy_dat4	USBA0 data bit 4 to/from external transceiver	IO	Y3	-
usba0_ulpiphy_dat5	USBA0 data bit 5 to/from external transceiver	IO	Y4	-
usba0_ulpiphy_dat6	USBA0 data bit 6 to/from external transceiver	IO	AA1	-
usba0_ulpiphy_dat7	USBA0 data bit 7 to/from external transceiver	IO	AA2	-
usba0_otg_ce	USBA0 OTG charging enable signal	O	C3	-
usba0_otg_dp	USBA0 OTG data p	IODS	B5	-
usba0_otg_dm	USBA0 OTG data m	IODS	B4	-
Universal Serial Bus (USBB1)				
usbb1_ulpiphy_clk	USBB1 IO to/from external transceiver 60-MHz clock	I	AE18	-
usbb1_ulpiphy_stp	USBB1 output to external transceiver to stop data stream	O	AG19	-
usbb1_ulpiphy_dir	USBB1 data direction control from external transceiver	I	AF19	-
usbb1_ulpiphy_nxt	USBB1 next signal control from external transceiver	I	AE19	-
usbb1_ulpiphy_dat0	USBB1 data bit 0 to/from external transceiver	IO	AF18	-
usbb1_ulpiphy_dat1	USBB1 data bit 1 to/from external transceiver	IO	AG18	-

Table 2-27. USB Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
usbb1_ulpiphy_dat2	USBB1 data bit 2 to/from external transceiver	IO	AE17	-
usbb1_ulpiphy_dat3	USBB1 data bit 3 to/from external transceiver	IO	AF17	-
usbb1_ulpiphy_dat4	USBB1 data bit 4 to/from external transceiver	IO	AH17	-
usbb1_ulpiphy_dat5	USBB1 data bit 5 to/from external transceiver	IO	AE16	-
usbb1_ulpiphy_dat6	USBB1 data bit 6 to/from external transceiver	IO	AF16	-
usbb1_ulpiphy_dat7	USBB1 data bit 7 to/from external transceiver	IO	AG16	-
usbb1_ulpitll_clk	USBB1 ULPI TLL Clock	O	AE18	-
usbb1_ulpitll_stp	USBB1 ULPI TLL Stop	I	AG19	-
usbb1_ulpitll_dir	USBB1 ULPI TLL Dir	O	AF19	-
usbb1_ulpitll_nxt	USBB1 ULPI TLL Next	O	AE19	-
usbb1_ulpitll_dat0	USBB1 ULPI TLL data bit 0	IO	AF18	-
usbb1_ulpitll_dat1	USBB1 ULPI TLL data bit 1	IO	AG18	-
usbb1_ulpitll_dat2	USBB1 ULPI TLL data bit 2	IO	AE17	-
usbb1_ulpitll_dat3	USBB1 ULPI TLL data bit 3	IO	AF17	-
usbb1_ulpitll_dat4	USBB1 ULPI TLL data bit 4	IO	AH17	-
usbb1_ulpitll_dat5	USBB1 ULPI TLL data bit 5	IO	AE16	-
usbb1_ulpitll_dat6	USBB1 ULPI TLL data bit 6	IO	AF16	-
usbb1_ulpitll_dat7	USBB1 ULPI TLL data bit 7	IO	AG16	-
usbb1_hsic_data	USBB1 Inter chip data	IO	AF14	-
usbb1_hsic_strobe	USBB1 Inter chip strobe	IO	AE14	-
usbb1_mm_rxdm	USBB1 Vminus receive data (not used in 3- or 4-pin configurations)	IO	AE19	-
usbb1_mm_rxdp	USBB1 Vplus receive data (not used in 3- or 4-pin configurations)	IO	AG19	-
usbb1_mm_rxcv	USBB1 differential receiver signal input (not used in 3-pin mode)	IO	AF17	-
usbb1_mm_txse0	USBB1 single-ended zero. Used as VM in 4-pin VP_VM mode.	IO	AE17	-
usbb1_mm_txdat	USBB1 data. Used as VP in 4-pin VP_VM mode.	IO	AG18	-
usbb1_mm_txen	USBB1 transmit enable	IO	AF18	-
Universal Serial Bus (USB2)				
usbb2_ulpiphy_clk	USBB2 IO to/from external transceiver 60-MHz clock	I	AG12	-
usbb2_ulpiphy_stp	USBB2 output to external transceiver to stop data stream	O	AF12	-
usbb2_ulpiphy_dir	USBB2 data direction control from external transceiver	I	AE12	-
usbb2_ulpiphy_nxt	USBB2 next signal control from external transceiver	I	AG13	-
usbb2_ulpiphy_dat0	USBB2 data bit 0 to/from external transceiver	IO	AE11	-
usbb2_ulpiphy_dat1	USBB2 data bit 1 to/from external transceiver	IO	AF11	-
usbb2_ulpiphy_dat2	USBB2 data bit 2 to/from external transceiver	IO	AG11	-
usbb2_ulpiphy_dat3	USBB2 data bit 3 to/from external transceiver	IO	AH11	-
usbb2_ulpiphy_dat4	USBB2 data bit 4 to/from external transceiver	IO	AE10	-
usbb2_ulpiphy_dat5	USBB2 data bit 5 to/from external transceiver	IO	AF10	-
usbb2_ulpiphy_dat6	USBB2 data bit 6 to/from external transceiver	IO	AG10	-
usbb2_ulpiphy_dat7	USBB2 data bit 7 to/from external transceiver	IO	AE9	-
usbb2_ulpitll_clk	USBB2 ULPI TLL Clock	O	AG12	-
usbb2_ulpitll_stp	USBB2 ULPI TLL Stop	I	AF12	-
usbb2_ulpitll_dir	USBB2 ULPI TLL Dir	O	AE12	-
usbb2_ulpitll_nxt	USBB2 ULPI TLL Next	O	AG13	-

Table 2-27. USB Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
usbb2_ulpitll_dat0	USBB2 ULPI TLL data bit 0	IO	AE11	-
usbb2_ulpitll_dat1	USBB2 ULPI TLL data bit 1	IO	AF11	-
usbb2_ulpitll_dat2	USBB2 ULPI TLL data bit 2	IO	AG11	-
usbb2_ulpitll_dat3	USBB2 ULPI TLL data bit 3	IO	AH11	-
usbb2_ulpitll_dat4	USBB2 ULPI TLL data bit 4	IO	AE10	-
usbb2_ulpitll_dat5	USBB2 ULPI TLL data bit 5	IO	AF10	-
usbb2_ulpitll_dat6	USBB2 ULPI TLL data bit 6	IO	AG10	-
usbb2_ulpitll_dat7	USBB2 ULPI TLL data bit 7	IO	AE9	-
usbb2_hsic_data	USBB2 Inter chip data	IO	AF13	-
usbb2_hsic_strobe	USBB2 Inter chip strobe	IO	AE13	-
usbb2_mm_rxdm	USBB2 Vminus receive data (not used in 3- or 4-pin configurations)	IO	AD27	-
usbb2_mm_rxdp	USBB2 Vplus receive data (not used in 3- or 4-pin configurations)	IO	AD26	-
usbb2_mm_rxcv	USBB2 differential receiver signal input (not used in 3-pin mode)	IO	AD25	-
usbb2_mm_txse0	USBB2 single-ended zero. Used as VM in 4-pin VP_VM mode.	IO	AE24 / AG11	-
usbb2_mm_txdat	USBB2 data. Used as VP in 4-pin VP_VM mode.	IO	AF24 / AF11	-
usbb2_mm_txen	USBB2 transmit enable	IO	AC28 / AE11	-

2.4.4 Removable Media Interfaces

2.4.4.1 MMC/SDIO

NOTE

For more information, see the MMC/SD/SDIO section of the OMAP4470 TRM.

Table 2-28. MMC/SDIO Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Multimedia Memory Card / Secure Digital IO (SDMMC1)				
sdmmc1_clk	SDMMC1 clock	O	D25 / D2	-
sdmmc1_cmd	SDMMC1 command	IO	B22 / E3	-
sdmmc1_dat0	SDMMC1 data bit 0	IO	C16 / E4	-
sdmmc1_dat1	SDMMC1 data bit 1	IO	D16 / E2	-
sdmmc1_dat2	SDMMC1 data bit 2	IO	C17 / E1	-
sdmmc1_dat3	SDMMC1 data bit 3	IO	D17 / F4	-
sdmmc1_dat4	SDMMC1 data bit 4	IO	C18 / F3	-
sdmmc1_dat5	SDMMC1 data bit 5	IO	D18 / F1	-
sdmmc1_dat6	SDMMC1 data bit 6	IO	C19 / G4	-
sdmmc1_dat7	SDMMC1 data bit 7	IO	D19 / G3	-
Multimedia Memory Card / Secure Digital IO (SDMMC2)				
sdmmc2_clk	SDMMC2 clock	O	B11 / AE5	-
sdmmc2_cmd	SDMMC2 command	IO	B12 / AF5	-
sdmmc2_dat0	SDMMC2 data bit 0	IO	C12 / AE4	-
sdmmc2_dat1	SDMMC2 data bit 1	IO	D12 / AF4	-
sdmmc2_dat2	SDMMC2 data bit 2	IO	C13 / AG3	-
sdmmc2_dat3	SDMMC2 data bit 3	IO	D13 / AF3	-

Table 2-28. MMC/SDIO Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
sdmmc2_dat4	SDMMC2 data bit 4	IO	C15 / AD3	-
sdmmc2_dat5	SDMMC2 data bit 5	IO	D15 / AD4	-
sdmmc2_dat6	SDMMC2 data bit 6	IO	A16 / AC2	-
sdmmc2_dat7	SDMMC2 data bit 7	IO	B1 / AD26	-
sdmmc2_dir_cmd	SDMMC2 command direction signal to drive external level shifter	O	A16	-
sdmmc2_dir_dat0	SDMMC2 data bit 0 direction signal to drive external level shifter	O	C15	-
sdmmc2_dir_dat1	SDMMC2 data bit 1/3 direction signal to drive external level shifter	O	D15	-
sdmmc2_clk_fdbk	SDMMC2 clock feedback if external loop back is needed	I	B16	-
Multimedia Memory Card / Secure Digital IO (SDMMC3)				
sdmmc3_clk	SDMMC3 clock	O	AB26 / AE9	-
sdmmc3_cmd	SDMMC3 command	IO	AB27 / AG10	-
sdmmc3_dat0	SDMMC3 data bit 0	IO	AA25 / AE10	-
sdmmc3_dat1	SDMMC3 data bit 1	IO	AA26 / AH11	-
sdmmc3_dat2	SDMMC3 data bit 2	IO	AB25 / AG11	-
sdmmc3_dat3	SDMMC3 data bit 3	IO	AC27 / AF10	-
Multimedia Memory Card / Secure Digital IO (SDMMC4)				
sdmmc4_clk	SDMMC4 clock	O	AE21 / AF12	-
sdmmc4_cmd	SDMMC4 command	IO	AF20 / AG12	-
sdmmc4_dat0	SDMMC4 data bit 0	IO	AF21 / AE12	-
sdmmc4_dat1	SDMMC4 data bit 1	IO	AH19 / AG13	-
sdmmc4_dat2	SDMMC4 data bit 2	IO	AG20 / AE11	-
sdmmc4_dat3	SDMMC4 data bit 3	IO	AE20 / AF11	-
Multimedia Memory Card / Secure Digital IO (SDMMC5)				
sdmmc5_clk	SDMMC5 clock	O	AE5	-
sdmmc5_cmd	SDMMC5 command	IO	AF5	-
sdmmc5_dat0	SDMMC5 data bit 0	IO	AE4	-
sdmmc5_dat1	SDMMC5 data bit 1	IO	AF4	-
sdmmc5_dat2	SDMMC5 data bit 2	IO	AG3	-
sdmmc5_dat3	SDMMC5 data bit 3	IO	AF3	-

2.4.5 Test Interfaces

2.4.5.1 JTAG

NOTE

For more information, see the On-Chip Debug Support / Debug Ports section of the OMAP4470 TRM.

Table 2-29. JTAG Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
jtag_nrst	JTAG [®] test reset	I	AH2	-
jtag_tck	JTAG test clock	I	F4 / AG1	-
jtag_tms_tmisc	JTAG test mode select / compressed JTAG packet (CJTAG)	IO	E1 / AH1	-

Table 2-29. JTAG Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
jtag_rtck	JTAG ARM [®] clock emulation	O	AE3	-
jtag_tdi	JTAG test data input	I	AE1	-
jtag_tdo	JTAG test data output	O	AE2	-

2.4.5.2 DPM**NOTE**

For more information, see the On-Chip Debug Support / Debug Ports section of the OMAP4470 TRM.

Table 2-30. DPM Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
dpm_emu0	Debug pin manager pin 0	IO	M2	-
dpm_emu1	Debug pin manager pin 1	IO	N2	-
dpm_emu2	Debug pin manager pin 2	O	P2	-
dpm_emu3	Debug pin manager pin 3	O	V1	-
dpm_emu4	Debug pin manager pin 4	O	V2	-
dpm_emu5	Debug pin manager pin 5	O	W1	-
dpm_emu6	Debug pin manager pin 6	O	W2	-
dpm_emu7	Debug pin manager pin 7	O	W3	-
dpm_emu8	Debug pin manager pin 8	O	W4	-
dpm_emu9	Debug pin manager pin 9	O	Y2	-
dpm_emu10	Debug pin manager pin 10	O	Y3	-
dpm_emu11	Debug pin manager pin 11	O	Y4	-
dpm_emu12	Debug pin manager pin 12	O	AA1	-
dpm_emu13	Debug pin manager pin 13	O	AA2	-
dpm_emu14	Debug pin manager pin 14	O	AA3	-
dpm_emu15	Debug pin manager pin 15	O	F4 / AA4	-
dpm_emu16	Debug pin manager pin 16	O	E1 / AB2	-
dpm_emu17	Debug pin manager pin 17	O	E2 / AB3	-
dpm_emu18	Debug pin manager pin 18	O	E4 / AF8 / AB4	-
dpm_emu19	Debug pin manager pin 19	O	D2 / AE8 / AC4	-

2.4.5.3 TPIU**NOTE**

For more information, see the On-Chip Debug Support / Debug Ports section of the OMAP4470 TRM.

Table 2-31. TPIU 16-Bit Signal Descriptions

SIGNAL NAME [1]	PIN NAME [6]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
-	dpm_emu0	-	NA	M2	-
-	dpm_emu1	-	NA	N2	-
atpiu_clk	dpm_emu2	TPIU ARM trace 16-bit clock	O	P2	-
atpiu_cntl	dpm_emu3	TPIU ARM trace 16-bit clock control	O	V1	-
atpiu_d0	dpm_emu4	TPIU ARM trace 16-bit data 0	O	V2	-

Table 2-31. TPIU 16-Bit Signal Descriptions (continued)

SIGNAL NAME [1]	PIN NAME [6]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
atpiu_d1	dpm_emu5	TPIU ARM trace 16-bit data 1	O	W1	-
atpiu_d2	dpm_emu6	TPIU ARM trace 16-bit data 2	O	W2	-
atpiu_d3	dpm_emu7	TPIU ARM trace 16-bit data 3	O	W3	-
atpiu_d4	dpm_emu8	TPIU ARM trace 16-bit data 4	O	W4	-
atpiu_d5	dpm_emu9	TPIU ARM trace 16-bit data 5	O	Y2	-
atpiu_d6	dpm_emu10	TPIU ARM trace 16-bit data 6	O	Y3	-
atpiu_d7	dpm_emu11	TPIU ARM trace 16-bit data 7	O	Y4	-
atpiu_d8	dpm_emu12	TPIU ARM trace 16-bit data 8	O	AA1	-
atpiu_d9	dpm_emu13	TPIU ARM trace 16-bit data 9	O	AA2	-
atpiu_d10	dpm_emu14	TPIU ARM trace 16-bit data 10	O	AA3	-
atpiu_d11	dpm_emu15	TPIU ARM trace 16-bit data 11	O	F4 / AA4	-
atpiu_d12	dpm_emu16	TPIU ARM trace 16-bit data 12	O	E1 / AB2	-
atpiu_d13	dpm_emu17	TPIU ARM trace 16-bit data 13	O	E2 / AB3	-
atpiu_d14	dpm_emu18	TPIU ARM trace 16-bit data 14	O	E4 / AF8 / AB4	-
atpiu_d15	dpm_emu19	TPIU ARM trace 16-bit data 15	O	D2 / AE8 / AC4	-

Table 2-32. TPIU 18-Bit Signal Descriptions

SIGNAL NAME [1]	PIN NAME [6]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
atpiu_d0	dpm_emu0	TPIU ARM trace 18-bit data 0	O	M2	-
atpiu_d1	dpm_emu1	TPIU ARM trace 18-bit data 1	O	N2	-
atpiu_clk	dpm_emu2	TPIU ARM trace 18-bit clock	O	P2	-
atpiu_cntl	dpm_emu3	TPIU ARM trace 18-bit clock control	O	V1	-
atpiu_d2	dpm_emu4	TPIU ARM trace 18-bit data 2	O	V2	-
atpiu_d3	dpm_emu5	TPIU ARM trace 18-bit data 3	O	W1	-
atpiu_d4	dpm_emu6	TPIU ARM trace 18-bit data 4	O	W2	-
atpiu_d5	dpm_emu7	TPIU ARM trace 18-bit data 5	O	W3	-
atpiu_d6	dpm_emu8	TPIU ARM trace 18-bit data 6	O	W4	-
atpiu_d7	dpm_emu9	TPIU ARM trace 18-bit data 7	O	Y2	-
atpiu_d8	dpm_emu10	TPIU ARM trace 18-bit data 8	O	Y3	-
atpiu_d9	dpm_emu11	TPIU ARM trace 18-bit data 9	O	Y4	-
atpiu_d10	dpm_emu12	TPIU ARM trace 18-bit data 10	O	AA1	-
atpiu_d11	dpm_emu13	TPIU ARM trace 18-bit data 11	O	AA2	-
atpiu_d12	dpm_emu14	TPIU ARM trace 18-bit data 12	O	AA3	-
atpiu_d13	dpm_emu15	TPIU ARM trace 18-bit data 13	O	F4 / AA4	-
atpiu_d14	dpm_emu16	TPIU ARM trace 18-bit data 14	O	E1 / AB2	-
atpiu_d15	dpm_emu17	TPIU ARM trace 18-bit data 15	O	E2 / AB3	-
atpiu_d16	dpm_emu18	TPIU ARM trace 18-bit data 16	O	E4 / AF8 / AB4	-
atpiu_d17	dpm_emu19	TPIU ARM trace 18-bit data 17	O	D2 / AE8 / AC4	-

2.4.5.4 STM

NOTE

For more information, see the On-Chip Debug Support / Debug Ports section of the OMAP4470 TRM.

Table 2-33. STM Signal Descriptions

SIGNAL NAME [1]	PIN NAME [6]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
Option 1					
astm_d0	dpm_emu0	System trace data 0	IO	M2	-
astm_d1	dpm_emu1	System trace data 1	IO	N2	-
astm_clk	dpm_emu2	System trace clock	O	P2	-
astm_d2	dpm_emu3	System trace data 3	O	V1	-
astm_d3	dpm_emu4	System trace data 4	O	V2	-
Option 2					
astm_d3	dpm_emu15	System trace data 3	O	F4 / AA4	-
astm_d2	dpm_emu16	System trace data 2	O	E1 / AB2	-
astm_d1	dpm_emu17	System trace data 1	O	E2 / AB3	-
astm_d0	dpm_emu18	System trace data 0	O	E4 / AF8 / AB4	-
astm_clk	dpm_emu19	System trace clock	O	D2 / AE8 / AC4	-
Option 3					
astm_clk	dpm_emu1	System trace clock	IO	N2	-
astm_d0	dpm_emu0	System trace data 0	IO	M2	-

2.4.5.5 ATTILA**Table 2-34. ATTILA Signal Descriptions**

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
attila_hw_dbg0	Attila hardware debug pin 0	O	M2	-
attila_hw_dbg1	Attila hardware debug pin 1	O	H4 / N2	-
attila_hw_dbg2	Attila hardware debug pin 2	O	J2 / P2	-
attila_hw_dbg3	Attila hardware debug pin 3	O	G2 / V1	-
attila_hw_dbg4	Attila hardware debug pin 4	O	J1 / V2	-
attila_hw_dbg5	Attila hardware debug pin 5	O	K1 / W1	-
attila_hw_dbg6	Attila hardware debug pin 6	O	AD2 / W2	-
attila_hw_dbg7	Attila hardware debug pin 7	O	AD3 / W3	-
attila_hw_dbg8	Attila hardware debug pin 8	O	AD4 / W4	-
attila_hw_dbg9	Attila hardware debug pin 9	O	AC2 / Y2	-
attila_hw_dbg10	Attila hardware debug pin 10	O	AC3 / Y3	-
attila_hw_dbg11	Attila hardware debug pin 11	O	AG6 / Y4	-
attila_hw_dbg12	Attila hardware debug pin 12	O	AF8 / AA1	-
attila_hw_dbg13	Attila hardware debug pin 13	O	AE8 / AA2	-
attila_hw_dbg14	Attila hardware debug pin 14	O	AA3	-
attila_hw_dbg15	Attila hardware debug pin 15	O	AA4	-
attila_hw_dbg16	Attila hardware debug pin 16	O	AB2	-
attila_hw_dbg17	Attila hardware debug pin 17	O	AB3	-
attila_hw_dbg18	Attila hardware debug pin 18	O	AB4	-
attila_hw_dbg19	Attila hardware debug pin 19	O	AC4	-
attila_hw_dbg20	Attila hardware debug pin 20	O	AE18	-
attila_hw_dbg21	Attila hardware debug pin 21	O	AG19	-
attila_hw_dbg22	Attila hardware debug pin 22	O	AF19	-
attila_hw_dbg23	Attila hardware debug pin 23	O	AE19	-
attila_hw_dbg24	Attila hardware debug pin 24	O	AF18	-
attila_hw_dbg25	Attila hardware debug pin 25	O	AG18	-
attila_hw_dbg26	Attila hardware debug pin 26	O	AE17	-

Table 2-34. ATTILA Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
attila_hw_dbg27	Attila hardware debug pin 27	O	AF17	-
attila_hw_dbg28	Attila hardware debug pin 28	O	AH17	-
attila_hw_dbg29	Attila hardware debug pin 29	O	AE16	-
attila_hw_dbg30	Attila hardware debug pin 30	O	AF16	-
attila_hw_dbg31	Attila hardware debug pin 31	O	AG16	-

2.4.6 General-Purpose IOs

NOTE

For more information, see the General-Purpose Interface section of the OMAP4470 TRM.

Table 2-35. GPIO Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
gpio_wk0	General-purpose IO 0, Bank1, always GPIO	IO	H4 / H4	-
gpio_0	General-purpose IO 0, Bank1	IO	J27	-
gpio_wk1	General-purpose IO 1, Bank1, always GPIO	IO	J2 / J2	-
gpio_1	General-purpose IO 1, Bank1	IO	H27	-
gpio_wk2	General-purpose IO 2, Bank1, always GPIO	IO	G2 / G2	-
gpio_2	General-purpose IO 2, Bank1	IO	L27	-
gpio_wk3	General-purpose IO 3, Bank1, always GPIO	IO	J1 / J1	-
gpio_3	General-purpose IO 3, Bank1	IO	K27	-
gpio_wk4	General-purpose IO 4, Bank1, always GPIO	IO	K1 / K1	-
gpio_wk6	General-purpose IO 5, Bank1, always GPIO	IO	AD2	-
gpio_wk7	General-purpose IO 6, Bank1, always GPIO	IO	AC2	-
gpio_wk8	General-purpose IO 7, Bank1, always GPIO	IO	AC3	-
gpio_wk9	General-purpose IO 8, Bank1, always GPIO	IO	AF8	-
gpio_wk10	General-purpose IO 9, Bank1, always GPIO	IO	AE8	-
gpio_11	General-purpose IO 11, Bank1	IO	M2	-
gpio_12	General-purpose IO 12, Bank1	IO	N2	-
gpio_13	General-purpose IO 13, Bank1	IO	P2	-
gpio_14	General-purpose IO 14, Bank1	IO	V1	-
gpio_15	General-purpose IO 15, Bank1	IO	V2	-
gpio_16	General-purpose IO 16, Bank1	IO	W1	-
gpio_17	General-purpose IO 17, Bank1	IO	W2	-
gpio_18	General-purpose IO 18, Bank1	IO	W3	-
gpio_19	General-purpose IO 19, Bank1	IO	W4	-
gpio_20	General-purpose IO 20, Bank1	IO	Y2	-
gpio_21	General-purpose IO 21, Bank1	IO	Y3	-
gpio_22	General-purpose IO 22, Bank1	IO	Y4	-
gpio_23	General-purpose IO 23, Bank1	IO	AA1	-
gpio_24	General-purpose IO 24, Bank1	IO	AA2	-
gpio_25	General-purpose IO 25, Bank1	IO	AA3	-
gpio_26	General-purpose IO 26, Bank1	IO	AA4	-
gpio_27	General-purpose IO 27, Bank1	IO	AB2	-
gpio_28	General-purpose IO 28, Bank1	IO	AB3	-
gpio_wk29	General-purpose IO 29, Bank1, always GPIO	IO	AG6	-

Table 2-35. GPIO Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
gpio_wk30	General-purpose IO 30, Bank1, always GPIO	IO	AD3	-
gpio_wk31	General-purpose IO 31, Bank1, always GPIO	IO	AD4	-
gpio_32	General-purpose IO 32	IO	C16	-
gpio_33	General-purpose IO 33	IO	D16	-
gpio_34	General-purpose IO 34	IO	C17	-
gpio_35	General-purpose IO 35	IO	D17	-
gpio_36	General-purpose IO 36	IO	C18	-
gpio_37	General-purpose IO 37	IO	D18	-
gpio_38	General-purpose IO 38	IO	C19	-
gpio_39	General-purpose IO 39	IO	D19	-

kpd_row6	Keypad row 6	I	B18 / AF21	-
kpd_row7	Keypad row 7	I	A19 / AE20	-
kpd_row8	Keypad row 8	I	D21 / AG20	-
kpd_col0	Keypad column 0	OD	C18 / G26 / H25	-
kpd_col1	Keypad column 1	OD	D18 / G25 / J27	-
kpd_col2	Keypad column 2	OD	C19 / H26 / H27	-
kpd_col3	Keypad column 3	OD	D19 / G26 / H25	-
kpd_col4	Keypad column 4	OD	B19 / G25 / J27	-
kpd_col5	Keypad column 5	OD	B20 / H26 / H27	-
kpd_col6	Keypad column 6	OD	A21 / AE21	-
kpd_col7	Keypad column 7	OD	B21 / AF20	-
kpd_col8	Keypad column 8	OD	C20 / AH19	-

2.4.8.3 POP

NOTE

For more information, see Package-On-Package Concept section of the OMAP4470 TRM.

Table 2-39. POP Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
pop_lpddr21_zq	Feedthrough to top lpddr21 ZQ pin	FEED	AH16	AJ17
pop_lpddr22_zq	Feedthrough to top lpddr22 ZQ pin	FEED	AF28	AG29
pop_vacc_lpddr2(1)	Feedthrough to top lpddr21 and lpddr22 vacc power supply	PWR	A26 / B2	B2 / B28
pop_vdd1_lpddr2_shared	Feedthrough to shared top lpddr21 and lpddr22 vdd1 power supply	PWR	AG27 / C1 / AG2	C1 / AH2 / AH28
pop_vdd1_lpddr21	Feedthrough to top lpddr21 vdd1 power supply	PWR	A13 / C27 / AH14	A15 / C28 / AJ15
pop_vdd1_lpddr22	Feedthrough to top lpddr22 vdd2 power supply	PWR	N1 / P1 / R28	N2 / P29 / R1
pop_vdd2_lpddr2_shared	Feedthrough to shared top lpddr21 and lpddr22 vdd2 power supply	PWR	AH3 / A3 / C28 / AF27	A3 / C29 / AG28 / AH3
pop_vdd2_lpddr21	Feedthrough to top lpddr21 vdd2 power supply	PWR	AG14 / A15 / B15	A16 / B16 / AH15
pop_vdd2_lpddr22	Feedthrough to top lpddr22 vdd2 power supply	PWR	T1 / T2 / N28	P28 / T1 / T2

(1) pop_vacc_lpdrr2 must be left unconnected.

2.4.8.4 System And Miscellaneous

NOTE

For more information, see:

- Power, Reset and Clock Management / PRCM Subsystem Environment / External Clock Signals section, or
 - Power, Reset and Clock Management / PRCM Subsystem Environment / External Reset Signals section, or
 - Power, Reset and Clock Management / PRCM Subsystem Environment / External Power Control Signals section
- of the OMAP4470 TRM.

Table 2-40. System and Miscellaneous Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
sys_32k	32-kHz clock input	I	AG7	-
sys_nrespwron	Global cold reset input	I	AE7	-
sys_nreswarm	Global warm reset input/output	IOD	AF7	-
sys_nirq1	External interrupt (aimed at TWL6032 PMIC power device connection)	I	AE6	-
sys_nirq2	External interrupt (aimed at TWL6032 PMIC power device connection)	I	AF6	-
sys_pwr_req	Power request to exit off mode. Active high by default but configurable	O	AH7	-
sys_pwron_reset_out	Peripheral power on reset output	O	AG6	-
sys_drm_msecure	Secure mode output	O	AD2 / AD3 / AA3	-
sys_secure_indicator	Secure mode indicator	O	AD4 / AA4	-
sys_boot0	System boot configuration pin0	I	F26	-
sys_boot1	System boot configuration pin1	I	E27	-
sys_boot2	System boot configuration pin2	I	E26	-
sys_boot3	System boot configuration pin3	I	E25	-
sys_boot4	System boot configuration pin4	I	D28	-
sys_boot5	System boot configuration pin5	I	D27	-
sys_boot6	System boot configuration pin6	I	AF8	-
sys_boot7	System boot configuration pin7	I	AE8	-
sys_ndmareq0	External DMA request 0	I	B25 / D23	-
sys_ndmareq1	External DMA request 1	I	C25 / A24	-
sys_ndmareq2	External DMA request 2	I	B22 / B24	-
sys_ndmareq3	External DMA request 3	I	D25 / C24	-
fref_xtal_in	FREF oscillator cell drive pad input or alternate clock square input	AI-I	AH6	-
fref_xtal_out	FREF oscillator cell drive pad output	AO	AH5	-
fref_xtal_vssosc	FREF oscillator kelvin ground	na	AG5	-
fref_slicer_in	FREF main clock input to slicer or alternate clock input to internal peripheral	AI-I	AG8	-
fref_clk_ioreq	FREF input (sysboot[67] = 00) or output (sysboot[67] = 01, 10, 11) clock request for main clock	IO	AD1	-
fref_clk0_out	FREF clock 0 output	O	AD2	-
fref_clk1_out	FREF clock 1 output	O	AA28	-
fref_clk2_out	FREF clock 2 output	O	Y28	-
fref_clk3_out	FREF clock 3 output	O	AD4	-
fref_clk4_out	FREF clock 4 output. Active by default	O	AC3	-

Table 2-40. System and Miscellaneous Signal Descriptions (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]
fref_clk5_out	FREF clock 5 output	O	AC2	-
fref_clk1_req	FREF clock request 1	I	AD2 / AD3	-
fref_clk2_req	FREF clock request 2	I	AD4	-
fref_clk3_req	FREF clock request 3	I	AD3	-
fref_clk4_req	FREF clock request 4	I	AC2	-
abe_clks	ABE clock input	I	AH26	-
atestv ⁽¹⁾	Reserved	AO	A27	-
vsense ⁽¹⁾	Reserved	AO	AG28	-
iforce ⁽¹⁾	Reserved	AI	AH27	-

(1) atestv, iforce, and vsense pins must be left unconnected.

The following bottom balls are reserved: C5 / C6 / D3 / D4 / D5 / D6 / L22 / N7. These balls must be left unconnected.

2.4.9 Power Supplies

NOTE

For more information, see Power, Reset and Clock Management / PRCM Subsystem Environment / External Voltage Inputs section of the OMAP4470 TRM.

Table 2-41. Power Supplies Signal Descriptions

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM [4]	BALL TOP [5]

cap_vdd_ldo_sram_mpu	MPU SRAM LDO output	PWR	AB11	-
cap_vdd_ldo_sram_iva_audio	IVA SRAM LDO output	PWR	N21	-
cap_vdd_ldo_sram_core	Core SRAM LDO output	PWR	U22	-
cap_vdd_ldo_emu_wkup	Wake-Up LDO output	PWR	T7	-

(1) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.

(2) This ball must be left unconnected.

3 Electrical Characteristics

NOTE

For more information, see Power, Reset and Clock Management / PRCM Subsystem Environment / External Voltage Inputs or Initialization / Preinitialization / Power Requirements section of the OMAP4470 TRM.

3.1 Absolute Maximum Ratings

Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under [Section 3.2, Recommended Operating Conditions](#), is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

Table 3-1. Absolute Maximum Rating Over Junction Temperature Range

PARAMETER		MIN	MAX	UNIT
vdd_mpu	Supply voltage for ARM MPU domain	-0.5	1.50	V
vdd_iva_audio	Supply voltage for IVA2 and audio BE domain	-0.5	1.50	V
vdd_core	Supply voltage for OMAP core domain	-0.5	1.50	V
vpp ⁽⁴⁾	Supply for eFuse programming	-0.5	2.10	V
vpp_cust ⁽⁴⁾	Supply for customer eFuse programming	-0.5	2.10	V
I _{vpp} ⁽⁴⁾	Peak vpp current for eFuse programming	0.05	50	mA
vdda_dll0_lpddr21	Supply voltage for LPDDR21 DLL providing clocks to byte 0 and 2	-0.5	2.10	V
vdda_dll1_lpddr21	Supply voltage for LPDDR21 DLL providing clocks to byte 1 and 3	-0.5	2.10	V
vdda_dll0_lpddr22	Supply voltage for LPDDR22 DLL providing clocks to byte 0 and 2	-0.5	2.10	V
vdda_dll1_lpddr22	Supply voltage for LPDDR22 DLL providing clocks to byte 1 and 3	-0.5	2.10	V
vdda_dppll_mpu	Supply voltage for MPU DPLLs	-0.5	2.10	V
vdda_dppll_core_audio	Supply voltage for core and audio DPLLs	-0.5	2.10	V
vdda_dppll_iva_per	Supply voltage for IVA and peripherals DPLLs	-0.5	2.10	V
vdda_csi21	Supply voltage for CSI21 PHY buffer	-0.5	2.10	V
vdda_csi22	Supply voltage for CSI22 PHY buffer	-0.5	2.10	V
vdda_dsi1	Supply voltage for DSI1_1 PHY buffer	-0.5	2.10	V
vdda_dsi2	Supply voltage for DSI1_2 PHY buffer	-0.5	2.10	V
vdda_ldo_sram_mpu	Supply voltage for MPU SRAM LDO	-0.5	2.10	V
vdda_ldo_sram_iva_audio	Supply voltage for IVA and audio SRAM LDO	-0.5	2.10	V
vdda_ldo_sram_core	Supply voltage for core SRAM LDO	-0.5	2.10	V
vdda_ldo_emu_wkup	Supply voltage for wake-up / emulation LDO	-0.5	2.10	V
vdda_bdgp_vbb	Supply voltage for bandgap	-0.5	2.10	V
vdda_hdmi	Supply voltage for HDMI PHY buffers	-0.5	2.10	V
vdda_usba0otg_3p3v	Supply voltage for USB PHY 3.3-V buffers	-0.5	4.00	V
vdda_usba0otg_1p8v	Supply voltage for USB PHY 1.8-V buffers	-0.5	2.10	V
vdds_1p2v	Supply voltage for 1.2-V I/O macros	-0.5	1.50	V
vdds_1p8v	Supply voltage for 1.8-V I/O macros	-0.5	2.10	V
vdds_1p8_fref	Supply voltage for 1.8-V FREF I/O macros	-0.5	2.10	V
vdds_dv_gpmc	Supply voltage for GPMC dual voltage I/Os	-0.5	2.10	V
vdds_sdmmc1	Supply voltage for SDMMC1 dual voltage I/Os	-0.5	3.80	V
vdds_dv_sdmmc2	Supply voltage for SDMMC2 dual voltage I/Os	-0.5	2.10	V
vdds_dv_c2c	Supply voltage for C2C dual voltage I/Os	-0.5	2.10	V
vdds_dv_cam	Supply voltage for camera dual voltage I/Os	-0.5	2.10	V
vdds_dv_bank0	Supply voltage for serial interface bank0 dual voltage I/Os	-0.5	2.10	V

Table 3-1. Absolute Maximum Rating Over Junction Temperature Range (continued)

PARAMETER		MIN	MAX	UNIT
vdds_dv_bank1	Supply voltage for serial interface bank1 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank2	Supply voltage for serial interface bank2 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank3	Supply voltage for serial interface bank3 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank4	Supply voltage for serial interface bank4 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank5	Supply voltage for serial interface bank5 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank6	Supply voltage for serial interface bank6 dual voltage IOs	-0.5	2.10	V
vdds_dv_bank7	Supply voltage for serial interface bank7 dual voltage IOs	-0.5	2.10	V
vdds_dv_fref	Supply voltage for FREF dual voltage IOs	-0.5	2.10	V
vddq_lpddr2	Supply voltage for LPDDR2 IOs	-0.4	1.50	V
vddq_vref_lpddr2	Supply voltage for LPDDR2 DQ VREF: Channel 1 on ball G15 Channel 2 on ball T8	-0.4	1.50	V
vddca_lpddr2	Supply voltage for LPDDR2 CA, clock, clock enable, and chip select IOs	-0.4	1.50	V
vddca_vref_lpddr2	Supply voltage for LPDDR2 CA VREF: Channel 1 on ball Y14 Channel 2 on ball R27	-0.4	1.50	V
V _{ESD}	ESD stress voltage ⁽¹⁾	HBM (Human Body Model) ⁽²⁾	>1000	V
		CDM (Charged Device Model) ⁽³⁾	>250	
I _{IOI}	Current-pulse injection on each I/O pin ⁽⁶⁾	100		mA
I _{clamp}	Clamp current for an input or output	-20	20	mA
T _{STG} ⁽⁵⁾	Storage temperature range after soldered onto PC Board	-65	150	°C

(1) Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.

(2) Level listed is the passing level per ANSI/ESDA/JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500-V HBM is possible if necessary precautions are taken. Pins listed as 1000V may actually have higher performance.

(3) Level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 250-V CDM is possible if necessary precautions are taken. Pins listed as 250 V may actually have higher performance.

(4) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.

(5) For tape and reel the storage temperature range is [-10°C to 50°C] with a maximum relative humidity of 70%. It is recommended returning to ambient room temperature before usage.

(6) Latch-up testing per JEDEC JESD78 stressed at 105°C with I/O pin injection of the lower of specified current or the current reached at 1.5 times maximum I/O voltage.

Table 3-2 summarizes the power consumption at the ball level.

Table 3-2. Maximum Current Ratings at Ball Level

PARAMETER		MAX	UNIT		
SIGNAL	DESCRIPTION				
vdd_mpu ⁽¹⁾	Maximum current rating for ARM MPU	OPPNTSB (MPU @ 1500 MHz)	Peak current	3600	mA
			Sustained current	2900	
	OPPNT (MPU @ 1300 MHz)	Peak current	2900		
		Sustained current	2300		
vdd_iva_audio ⁽¹⁾	Maximum current rating for IVA2 and audio BE (including in OPPNTSB mode)	1000	mA		
vdd_core ⁽¹⁾	Maximum current rating for OMAP Core (including in overdrive mode – OPP119%)	1800	mA		
vpp ⁽³⁾	Maximum current rating for eFuse programming	50	mA		
vpp_cust ⁽³⁾	Maximum current rating for customer eFuse programming	50	mA		
vdda_dll0_lpddr21	Maximum current rating for LPDDR21 DLL providing clocks to bytes 0 and 2	5	mA		
vdda_dll1_lpddr21	Maximum current rating for LPDDR21 DLL providing clocks to bytes 1 and 3	5	mA		

Table 3-2. Maximum Current Ratings at Ball Level (continued)

PARAMETER		MAX	UNIT
SIGNAL	DESCRIPTION		
vdda_dll0_lpddr22	Maximum current rating for LPDDR22 DLL providing clocks to bytes 0 and 2	5	mA
vdda_dll1_lpddr22	Maximum current rating for LPDDR22 DLL providing clocks to bytes 1 and 3	5	mA
vdda_dppll_mpu	Maximum current rating for MPU DPLLs	5	mA
vdda_dppll_core_audio	Maximum current rating for core and audio DPLLs	10	mA
vdda_dppll_iva_per	Maximum current rating for IVA and peripheral DPLLs	10	mA
vdda_csi21	Maximum current rating for CSI21 PHY buffer	10	mA
vdda_csi22	Maximum current rating for CSI22 PHY buffer	5	mA
vdda_dsi1	Maximum current rating for DSI1_1 PHY buffer	15	mA
vdda_dsi2	Maximum current rating for DSI1_2 PHY buffer	10	mA
vdda_ldo_sram_mpu	Maximum current rating for MPU SRAM LDO	30	mA
vdda_ldo_sram_iva_audio	Maximum current rating for IVA and audio SRAM LDO	30	mA
vdda_ldo_sram_core	Maximum current rating for Core SRAM LDO	30	mA
vdda_ldo_emu_wkup	Maximum current rating for wake-up / emulation LDO	60	mA
vdda_bdgp_vbb	Maximum current rating for bandgap	60	mA
vdda_hdmi	Maximum current rating for HDMI PHY buffers	35	mA
vdda_usba0otg_3p3v	Maximum current rating for USB PHY 3.3-V buffers	30	mA
vdda_usba0otg_1p8v	Maximum current rating for USB PHY 1.8-V buffers	35	mA
vdds_1p2v	Maximum current rating for 1.2-V I/O macros	20	mA
vdds_1p8v	Maximum current rating for 1.8-V I/O macros	160	mA
vdds_1p8_fref	Maximum current rating for 1.8-V FREF I/O macros	5	mA
vdds_dv_gpmc	Maximum current rating for GPMC dual voltage I/Os	10	mA
vdds_sdmmc1 ⁽²⁾	Maximum current rating for SDMMC1 dual voltage I/Os	20	mA
vdds_dv_sdmmc2 ⁽²⁾	Maximum current rating for SDMMC2 dual voltage I/Os	10	mA
vdds_dv_c2c	Maximum current rating for C2C dual voltage I/Os	5	mA
vdds_dv_cam	Maximum current rating for Camera dual voltage I/Os	5	mA
vdds_dv_bank0	Maximum current rating for serial interface bank0 dual voltage I/Os	5	mA
vdds_dv_bank1	Maximum current rating for serial interface bank1 dual voltage I/Os	5	mA
vdds_dv_bank2	Maximum current rating for serial interface bank2 dual voltage I/Os	5	mA
vdds_dv_bank3	Maximum current rating for serial interface bank3 dual voltage I/Os	5	mA
vdds_dv_bank4	Maximum current rating for serial interface bank4 dual voltage I/Os	5	mA
vdds_dv_bank5	Maximum current rating for serial interface bank5 dual voltage I/Os	5	mA
vdds_dv_bank6	Maximum current rating for serial interface bank6 dual voltage I/Os	5	mA
vdds_dv_bank7	Maximum current rating for serial interface bank6 dual voltage I/Os	5	mA
vdds_dv_fref	Maximum current rating for FREF dual voltage I/Os	5	mA
vddq_lpddr2	Maximum current rating for LPDDR2 I/Os	275	mA
vddq_vref_lpddr2	Maximum current rating for LPDDR2 DQ VREF: Channel 1 on ball G15 Channel 2 on ball T8	1	mA
vddca_lpddr2	Maximum current rating for LPDDR2 CA, clock, clock enable and chip select I/Os	25	mA
vddca_vref_lpddr2	Maximum current rating for LPDDR2 CA VREF: Channel 1 on ball Y14 Channel 2 on ball R27	1	mA

(1) With SmartReflex™ enabled.

(2) MMC card and I/O card are not included.

(3) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.

3.2 Recommended Operating Conditions

The device is used under the recommended operating conditions described in [Table 3-3](#).

NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

Table 3-3. Recommended Operating Conditions

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
Input Power Supply Voltage Range					
vdd_mpu	Supply voltage for ARM MPU domain	See ⁽¹⁾			V
	Noise (peak-peak)	f < 10 MHz	80		mV _{PPmax}
		f ≥ 10 MHz	50		
vdd_iva_audio	Supply voltage range for IVA2 and audio BE domain	See ⁽¹⁾			V
	Noise (peak-peak)	f < 10 MHz	80		mV _{PPmax}
		f ≥ 10 MHz	50		
vdd_core	Supply voltage range for OMAP Core domain	See ⁽¹⁾			V
	Noise (peak-peak)	f < 10 MHz	80		mV _{PPmax}
		f ≥ 10 MHz	50		
vdda_dli0_lpddr21	Supply voltage for LPDDR21 DLL providing clocks to bytes 0 and 2	See ⁽⁴⁾			V
	Noise (peak-peak)		50		mV _{PPmax}
vdda_dli1_lpddr21	Supply voltage for LPDDR21 DLL providing clocks to bytes 1 and 3	See ⁽⁴⁾			V
	Noise (peak-peak)		50		mV _{PPmax}
vdda_dli0_lpddr22	Supply voltage for LPDDR22 DLL providing clocks to bytes 0 and 2	See ⁽⁴⁾			V
	Noise (peak-peak)		50		mV _{PPmax}
vdda_dli1_lpddr22	Supply voltage for LPDDR22 DLL providing clocks to bytes 1 and 3	See ⁽⁴⁾			V
	Noise (peak-peak)		50		mV _{PPmax}
vdda_dpil_mpu	Supply voltage for MPU DPLLs	1.71	1.80	1.89	V
	Noise (peak-peak)		50		mV _{PPmax}
vdda_dpil_core_audio	Supply voltage for core and audio DPLLs	1.71	1.80	1.89	V
	Noise (peak-peak)		50		mV _{PPmax}

		1.8-V Mode	1.71	1.80	1.89	
	Noise (peak-peak)	1.2-V Mode		50		mV _{PPmax}
		1.8-V Mode				
vdds_dv_fref	Supply voltage for FREF dual voltage IOs	1.2-V Mode	1.14	1.20	1.26	V
		1.8-V Mode	1.71	1.80	1.89	
	Noise (peak-peak)	1.2-V Mode		50		mV _{PPmax}
		1.8-V Mode				
vddq_lpddr2	Supply voltage for LPDDR2 IOs	1.14	1.20	1.30	V	
	Noise (peak-peak)			100	mV _{PPmax}	
vddq_vref_lpddr2	Supply voltage for embedded LPDDR2 DQ VREF voltage generator: Channel 1 on ball G15 Channel 2 on ball T8	vddq_lpddr2 ⁽⁵⁾			V	
	Noise (peak-peak)			5% * vddq_lpddr2	mV _{PPmax}	
vddca_lpddr2	Supply voltage for LPDDR2 CA, clock, clock enable and chip select IOs	1.14	1.20	1.30	V	
	Noise (peak-peak)			100	mV _{PPmax}	
vddca_vref_lpddr2	Supply voltage for embedded LPDDR2 CA VREF voltage generator: Channel 1 on ball Y14 Channel 2 on ball R27	vddca_lpddr2 ⁽⁵⁾			V	
	Noise (peak-peak)			5% * vddca_lpddr2	mV _{PPmax}	

Table 3-3. Recommended Operating Conditions (continued)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
vpp ⁽²⁾	Supply voltage for eFuse	1.65	1.70	1.75	V
vpp_cust ⁽²⁾	Supply voltage for customer eFuse	1.65	1.70	1.75	V
V _{PAD}	Voltage at I/O pad	0		vddy ⁽³⁾	V
vssa_usba0otg_3p3v	Ground for USB PHY 3.3-V buffer		0		V
vssa_usba0otg	Ground for USB PHY 1.8-V buffer		0		V
vssa_hdmi	Ground for HDMI PHY buffers		0		V
vssa_csi2	Ground for CSI2 PHY buffer		0		V
vssa_dsi	Ground for DSI buffer		0		V
vss	Main ground		0		V
T _B ⁽⁶⁾	Operating board (PCB) temperature range	–40		85	°C
T _J ⁽⁶⁾⁽⁷⁾	Operating junction temperature range (vpp turned off—floating)	–40		110 ⁽⁷⁾	°C
T _{J-VPP} ⁽²⁾	Operating junction temperature range during eFuse programming (vpp turned on)	–10		65	°C
Output Power Supply Voltage Range					
lpddr2_vref_dq	LPDDR2 DQ VREF output power supply to memory: Channel 1 on ball B15 Channel 2 on ball R2	0.49 * vddq_vref_ lpddr2	0.50 * vddq_vref_ lpddr2	0.51 * vddq_vref_ lpddr2	V
lpddr2_vref_ca	LPDDR2 CA VREF output power supply to memory: Channel 1 on ball AH16 Channel 2 on ball U28	0.49 * vddca_vref_ lpddr2	0.50 * vddca_vref_ lpddr2	0.51 * vddca_vref_ lpddr2	V

(1) See the operating condition addendum for values.

(2) vpp must be unconnected. vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating). If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when the vpp_cust is turned off.

(3) vddy refers to vdda_csiphy1, vdda_csiphy2, vdda_dsi, vdds, vdds_mem, and vdds_sdmmc1.

(4) The DLL power supplies (vdda_dll0_lpddr21, vdda_dll0_lpddr22, vdda_dll1_lpddr21, vdda_dll1_lpddr22) voltage ranges follow the vdd_core voltage ones. They can be shorted with vdd_core. See the operating condition addendum for values.

(5) vddq_vref_lpddr2 must be supplied from same voltage regulator as vddq_lpddr2 (same for vddca_vref_lpddr2 that must follow strictly vddca_lpddr2).

(6) The board temperature (T_B) and junction temperature (T_J) ranges are defined for 2S2P board types (reference JEDEC standard JESD51-9, *Test Board for Array Surface Mount Package Thermal Measurements*). The board temperature is measured at 1 mm from the package edge.

(7) Maximum supported junction temperature in functional operating condition is 110°C. That does not mean that 110°C of junction temperature is supported continuously.

3.3 DC Electrical Characteristics

Table 3-4 through Table 3-19 summarize the dc electrical characteristics.

NOTE

The interfaces or signals described in Table 3-4 through Table 3-19 correspond to the interfaces or signals available in multiplexing mode 0.

All interfaces or signals multiplexed on the balls or pins described in these tables have the same dc electrical characteristics, unless multiplexing involves a PHY/GPIO combination in which case different dc electrical characteristics are specified for the different multiplexing modes.

NOTE

In the following tables, V_{OL} and V_{OH} are JEDEC (JESD8-7A) compliant that means:

Normal range of V_{OH} / V_{OL} are $[V_{DD5} - 0.45 \text{ V}] / 0.45 \text{ V}$ respectively, for $I_{OH} / I_{OL} = 2 \text{ mA}$

Wide range is $V_{OH} / V_{OL} = [V_{DD5} - 0.2 \text{ V}] / 0.2 \text{ V}$ respectively, for $I_{OH} / I_{OL} = 100 \mu\text{A}$

Except for the following signals:

- hdmi_ddc_scl, hdmi_ddc_sda, 2c[1:4]_scl, i2c[1:4]_sda, sr_scl, sr_sda in I²C mode
(Balls: A8 / B8 / AE28 / AE26 / C26 / D26 / W27 / Y27 / AG21 / AH22 / AG9 / AF9)

1.8-V Mode					
V _{IH}	Input high-level threshold	0.65 * vdds_dv_gpmc		vdds_dv_gpmc + 0.3	V
V _{IL}	Input low-level threshold	–0.3		0.35 * vdds_dv_gpmc	V
V _{HYS} ⁽³⁾	Input hysteresis voltage	150			mV
V _{OH}	Output high-level threshold (I _{OH} = 4 mA)	vdds_dv_gpmc – 0.45			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.45	V

(1) Output transition time measured between 20% to 80% of vdds_dv_gpmc.

(2) In vdds_dv_y, y can have the value gpmc, sdmmc1, c2c depending on the pin or ball used. For more information of the power supply name and the corresponding pin, bal, see the POWER [9] column of Table 2-1.

(3) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T–}.

(4) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.

3.3.2 LPDDR2 DC Electrical Characteristics

Table 3-5 summarizes the LPDDR2 dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (i[2:0], sr[1:0], vref_tap[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-5. LPDDR2 DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT

		sr[1:0] = 11 (Slow)				110	
Signals in Mode 0: lpddr21_vref_ca, lpddr21_vref_dq, lpddr22_vref_ca, lpddr22_vref_dq (Top Balls: AH16 / B15 / U28 / R2)							
V _{REF}	Reference generation dc voltage level	vref_tap[1:0] = 00 (Mint_2ua mode)	0.495 * vddy_vref_lpddr2 ⁽⁸⁾	0.500 * vddy_vref_lpddr2 ⁽⁸⁾	0.505 * vddy_vref_lpddr2 ⁽⁸⁾	V	
		vref_tap[1:0] = 01 (Mint_4ua mode)	0.492 * vddy_vref_lpddr2 ⁽⁸⁾	0.500 * vddy_vref_lpddr2 ⁽⁸⁾	0.508 * vddy_vref_lpddr2 ⁽⁸⁾		
		vref_tap[1:0] = 10 (Mint_6ua mode)	0.490 * vddy_vref_lpddr2 ⁽⁸⁾	0.500 * vddy_vref_lpddr2 ⁽⁸⁾	0.510 * vddy_vref_lpddr2 ⁽⁸⁾		
		vref_tap[1:0] = 11 (Mint_8ua mode)	0.490 * vddy_vref_lpddr2 ⁽⁸⁾	0.500 * vddy_vref_lpddr2 ⁽⁸⁾	0.510 * vddy_vref_lpddr2 ⁽⁸⁾		

(1) This buffer is designed for high-speed application. In high-speed mode, it is fast enough to avoid any noise on the signal during transition and then hysteresis is not required.

(2) R_{REF} (reference output impedance) is considered to be the production trimming setting for Drv8 mode, with R_{REF} = 50 Ω, which corresponds to Z_O = 50 Ω (I_{OUT} = 8 mA). For a full description of the output impedance setting, see the the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

(3) To achieve optimal noise/speed trade off, the slew rate (turn-on time) of the output signal can be programmed using the slew rate control bits sr[1:0]. The control bits sr[1:0] do not affect the driver DC drive-strength. They only control the driver turn-on time. It is to be noted that turn-on time and maximum supply noise are the parameters defined to help user make relative comparison and correlate the driver operation at different turn-on time settings.

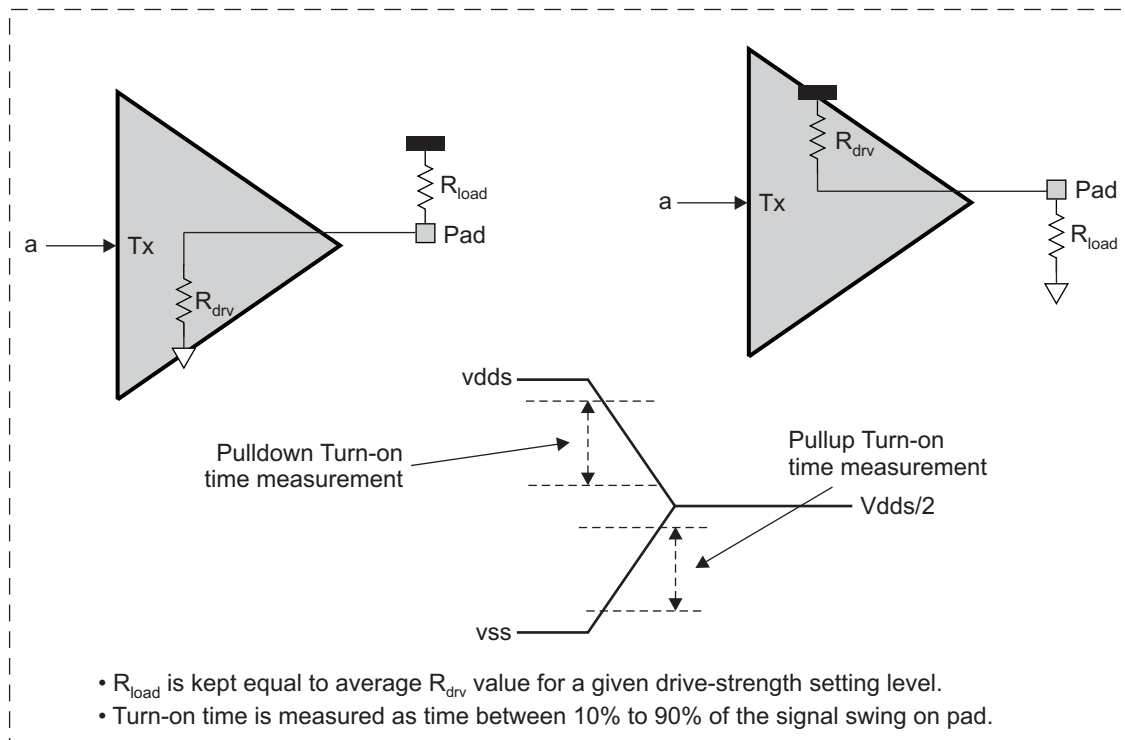

(4) Output transition time/turn-on time for Drv8 setting, i[2:0] = 011. For a full description of this setting, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

(5) Maximum noise (peak-peak) on the IO supply voltage for Drv8 setting, i[2:0] = 011.

(6) The measurement setup (see [Figure 3-1](#) and [Figure 3-2](#)) is not intended as a precise representation of any particular system environment or a depiction of the actual load presented. Maximum output supply noise (see [Figure 3-2](#), L*di/dt) on the IO supply is measured with 1 nH of inductance on the IO supply.

(7) vddx_lpddr2 can have the value vddq_lpddr2, vddca_lpddr21, vddca_lpddr22 depending on the ball used. For more information of the power supply name and the corresponding pin, ball, see the POWER [9] column of [Table 2-1](#).

(8) vddy_vref_lpddr2 can have the value vddca_vref_lpddr21, vddca_lpddr22, vddq_vref_lpddr21, vddq_vref_lpddr22 depending on the ball used. For more information of the power supply name and the corresponding pin, ball, see the POWER [9] column of [Table 2-1](#).

SWPS040-121

Figure 3-1. Output Turn-on Time Measurement

SWPS040-122

Figure 3-2. Output Supply Noise Measurement Setup⁽¹⁾⁽²⁾

(1) Maximum supply noise = $VDD_S - \text{minimum}(VDD_{S_L} - VSS_{S_L})$

(2) 1 nH is used for a typical package inductance on the supplies.

3.3.3 Camera DC Electrical Characteristics

Table 3-6 and Table 3-7 summarize the camera dc electrical characteristics in multiplexing mode 0.

Table 3-6. Camera CSI2 DC Electrical Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
Signals in Mode 0: csi21_dx[4:0], csi21_dy[4:0], csi22_dx[1:0], csi22_dy[1:0], csi22_dx2, csi22_dy2 (Bottom Balls: R26 / R25 / T26 / T25 / U26 / U25 / V26 / V25 / W26 / W25 / M26 / M25 / N26 / N25 / N27 / M27)

V _{IH}	Input high-level voltage	880			mV
V _{IL}	Input low-level voltage			300	mV
V _{ITH} ⁽¹⁾	Input high-level threshold			880	mV
V _{ITL} ⁽⁴⁾	Input low-level threshold	300			mV
V _{HYS} ⁽³⁾	Input hysteresis	25			mV
C _{IN}	Input capacitance			2.0	pF
MIPI D-PHY Mode High-Speed Receiver (HS-RX)					
V _{IDTH}	Differential input high-level threshold	70			mV
V _{IDTL}	Differential input low-level threshold			-70	mV
V _{IDMAX} ⁽⁷⁾	Maximum differential input voltage			270	mV
V _{IHHS} ⁽⁵⁾	Single-ended input high voltage			460	mV
V _{ILHS} ⁽⁵⁾	Single-ended input low voltage	-40			mV
V ₆ _{CMRXDC} ⁽⁵⁾⁽⁶⁾	Differential input common-mode voltage	70		330	mV
Z _{ID}	Differential input impedance	80	100	125	Ω
C _{IN}	Input capacitance			2.0	pF
CCP2 Mode (only on CSI2B)					
V _{CM}	Common mode input voltage range ⁽⁸⁾	0.6	0.9	1.2	V
V _{OS}	Receiver input dc offset	-20		20	mV
V _{ID}	Receiver input differential amplitude	140	200	400	mV _{PP}
ΔV _{ID} /V _{ID}	Amplitude mismatch between lane modules	-10%		10%	
ΔV _{CMRX}	Common mode mismatch between lane modules ⁽⁸⁾	-100		100	mV
ΔV _{CMn}	Common mode noise ripple ⁽⁹⁾	-15		15	mV
Z _{ID}	Differential input impedance	80	100	120	Ω
C _{IN}	Input capacitance			2.0	pF

- (1) V_{ITH} is the voltage at which the receiver is required to detect a high state in the input signal.
- (2) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. V_{ITL} is larger than the maximum single-ended line high voltage during HS transmission. Therefore, both LP receivers will detect low during HS signaling.
- (3) To reduce noise sensitivity on the received signal, the LP receiver is required to incorporate a hysteresis, V_{HYS} .
- (4) V_{ITL} is the voltage at which the receiver is required to detect a low state in the input signal. Specification is relaxed for detecting 0 during Ultralow-Power (ULP) state. The LP receiver is not required to detect HS single-ended voltage as 0 in this state.
- (5) Excluding possible additional RF interference of 200 mV_{PP} beyond 450 MHz.
- (6) This value includes a ground difference of 50 mV between the transmitter and the receiver, the static common-mode level tolerance and variations below 450 MHz.
- (7) This number is the transmitter V_{ODMAX} .
- (8) Common mode is defined as the average voltage level of DX and DY: $V_{CM} = (V_{DX} + V_{DY})/2$.
- (9) Common mode ripple may be due to rise-fall time and transmission line impairments in the PCB.
- (10) In vdda_y, y can have the value csi21 or csi22 depending on the ball used. For more information of the power supply name and the corresponding pin, ball, see the POWER [9] column of Table 2-1.
- (11) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-} .
- (12) The t_{TIN} (t_{RIN} and t_{FIN} also) value is the recommended condition. The t_{TIN} (t_{RIN} and t_{FIN} also) mismatch causes additional delay time inside the device then leads to ac timing invalidation in this DM. The t_{TIN} (t_{RIN} and t_{FIN} also) mismatch does not necessarily mean functional failure. This global value may be overridden on a per basis if another value is explicitly defined for that in the Timing Requirements and Switching Characteristics Chapter of the data manual.
- (13) The GPI mode is only available through multiplexing mode 3.

NOTE

For more information on the IO cell configurations (SC[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-7. Camera Control DC Electrical Characteristics

		SC[1:0] = 01	2	21	
		SC[1:0] = 10	7	33	
t _{OT}	Output transition time (rise time, t _R or fall time, t _F) measured between 10% to 90% of PAD voltage, minimum at the minimum load and maximum at the maximum load	SC[1:0] = 00	1	15	ns
		SC[1:0] = 01	0.4	5	
		SC[1:0] = 10	0.6	7	
1.2-V Mode					
V _{IH}	Input high-level threshold	0.65 * vdds_dv_cam		vdds_dv_cam + 0.3	V
V _{IL}	Input low-level threshold	-0.3		0.35 * vdds_dv_cam	V
V _{HYS} ⁽¹⁾	Input hysteresis voltage	135			mV
V _{OH}	Output high-level threshold (I _{OH} = -4 mA)	0.75 * vdds_dv_cam			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.25 * vdds_dv_cam	V
1.8-V Mode					
V _{IH}	Input high-level threshold	0.65 * vdds_dv_cam		vdds_dv_cam + 0.3	V
V _{IL}	Input low-level threshold	-0.3		0.35 * vdds_dv_cam	V
V _{HYS} ⁽¹⁾	Input hysteresis voltage	150			mV
V _{OH}	Output high-level threshold (I _{OH} = -4 mA)	vdds_dv_cam - 0.45			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.45	V

(1) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-} .

3.3.4 Display DC Electrical Characteristics

Table 3-8 summarizes the display dc electrical characteristics in multiplexing mode 0.

NOTE

More information on HDMI is not available in the public domain.

Table 3-8. Display DSI1 DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT
Signals in Mode 0: dsi1_dx[4:0], dsi1_dy[4:0], dsi2_dx[2:0], dsi2_dy[2:0] (Bottom Balls: P3 / P4 / N3 / N4 / M3 / M4 / L3 / L4 / K3 / K4 / T3 / T4 / U3 / U4 / V3 / V4)					
MIPI D-PHY—High-Speed Transmitter (HS-TX) mode					
$ V_{OD} ^{(1)}$	High-speed transmit differential voltage	140	200	270	mV
$V_{CMTX}^{(1)}$	High-speed transmit static common mode voltage	150	200	250	mV
$ \Delta V_{OD} $	V_{OD} mismatch when output is differential-1 or differential-0			10	mV
$ \Delta V_{CMTX(1,0)} $	V_{CMTX} mismatch when output is differential-1 or differential-0			5	mV
$V_{OHHS}^{(1)}$	High-speed output high voltage			360	mV
Z_{OS}	Single-ended output impedance	40	50	62.5	Ω
ΔZ_{OS}	Single-ended output impedance mismatch			10%	
$\Delta V_{CMTX(HF)}$	Common-level variation above 450 MHz			15	mV _{RMS}
$\Delta V_{CMTX(LF)}$	Common-level variation between 50 MHz and 450 MHz	-50		50	mV _{PEAK}
t_{ROUT}	Output transition time (t_{ROUT} or t_{FOUT} evaluated between 20% and 80% of PAD voltage)	0.15			ns
				0.3	UI
MIPI D-PHY—Low-Power Transmitter (LP-TX) mode					
V_{OL}	Thevenin output low level	-50		50	mV
V_{OH}	Thevenin output high level	1.1	1.2	1.3	V
Z_{OLP}	Output impedance of LP transmitter	110			Ω
t_{ROUT}	Output transition time (t_{ROUT} or t_{FOUT} evaluated between 20% and 80% of PAD voltage)			25	ns
MIPI D-PHY—Low-Power Receiver (LP-RX) Mode					
V_{IH}	Input high-level voltage	880			mV
V_{IL}	Input low-level voltage			550	mV
$V_{ITH}^{(2)}$	Input high-level threshold			880	mV
$V_{ITL}^{(3)}$	Input low-level threshold	550			mV
$V_{HYS}^{(4)}$	Input hysteresis	25			mV
MIPI D-PHY Mode Ultralow-Power Receiver (ULP-RX)					
V_{IH}	Input high-level voltage	880			mV
V_{IL}	Input low-level voltage			300	mV
$V_{ITH}^{(2)}$	Input high-level threshold			880	mV
$V_{ITL}^{(5)}$	Input low-level threshold	300			mV
$V_{HYS}^{(4)}$	Input hysteresis	25			mV
MIPI D-PHY Mode Low Power Contention Detector (LPCD)					
V_{IHCD}	High-level input voltage	450			mV
V_{ILCD}	Low-level input voltage			200	mV

- (1) Value when driving into differential load impedance anywhere in the range of 80 to 125 Ω . See Chapter 8 of the MIPI D-PHY standard v1.0 for complete specification on the electrical characteristics. The PCB interconnect must be 50- Ω transmission line on DSI dsi1_dx[4;0], DSI dsi1_dy[4;0] and DSI dsi2_dx[2;0], DSI dsi2_dy[2;0]. These lines must be well matched. See Chapter 7 of the MIPI D-PHY standard v1.0 for complete specification of the Interconnect.
- (2) V_{TH} is the voltage at which the receiver is required to detect a high state in the input signal.
- (3) V_{TL} is the voltage at which the receiver is required to detect a low state in the input signal. V_{TL} is larger than the maximum single-ended line high voltage during HS transmission. Therefore, both low-power receivers will detect low during high-speed signaling.
- (4) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-} . Hysteresis feature is added on the low-power received signal to reduce noise sensitivity.
- (5) V_{TL} is the voltage at which the receiver is required to detect a low state in the input signal. Specification is relaxed for detecting 0 during Ultralow-Power (ULP) state. The low-power receiver is not required to detect high-speed, single-ended voltage as 0 in this state.

3.3.5 HDQ/1-Wire DC Electrical Characteristics

Table 3-9 summarizes the HDQ/1-Wire dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (SC[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-9. HDQ/1-Wire DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT	
Signal in Mode 0: hdq_sio (Bottom Ball: AA29)						
C_{LOAD}	Load capacitance	SC[1:0] = 00	4		60	pF
		SC[1:0] = 01	2		21	
		SC[1:0] = 10	7		33	
t_{OT}	Output transition time (rise time, t_R or fall time, t_F) measured between 10% to 90% of PAD voltage, minimum at the minimum load and maximum at the maximum load	SC[1:0] = 00	1		15	ns
		SC[1:0] = 01	0.4		5	
		SC[1:0] = 10	0.6		7	
1.8-V Mode						
V_{IH}	Input high-level threshold	0.65 * vdds_1p8v			vdds_1p8v + 0.3	V
V_{IL}	Input low-level threshold	-0.3			0.35 * vdds_1p8v	V
$V_{HYS}^{(1)}$	Input hysteresis voltage	150				mV
V_{OH}	Output high-level threshold ($I_{OH} = -4$ mA)	vdds_1p8v - 0.45				V
V_{OL}	Output low-level threshold ($I_{OL} = 4$ mA)				0.45	V

(1) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-} .

3.3.6 I²C DC Electrical Characteristics

Table 3-10 summarizes the I²C dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (LB0[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-10. I²C DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT
Signals in Mode 0: i2c[4:1]_scl, i2c[4:1]_sda, sr_scl, sr_sda (Bottom Balls: AE28 / AE26 / C26 / D26 / W27 / Y27 / AG21 / AH22 / AG9 / AF9)					
I²C Standard Mode—1.2-V Mode and 1.8-V Mode					
V _{IH}	Input high-level threshold	0.7 * vdds_dv_y ⁽²⁾		vdds_dv_y ⁽²⁾ + 0.5	V
V _{IL}	Input low-level threshold	–0.5		0.3 * vdds_dv_y ⁽²⁾	V
I _I	Input current at each I/O pin with an input voltage between 0.1 * vdds_dv_y ⁽²⁾ to 0.9 * vdds_dv_y ⁽²⁾	–10		10	μA
C _I	Input capacitance			10	pF
V _{OL3}	Output low-level threshold open-drain at 3-mA sink current	NA ⁽¹⁾		NA ⁽¹⁾	V
t _{OF}	Output fall time from V _{IHmin} to V _{ILmax} with a bus capacitance C _b from 5 pF to 400 pF			250	ns
t _{OR}	Output rise time from V _{ILmax} to V _{IHmin} with a capacitive load from 5 pF to 150 pF with internal pullup resistor enabled	20 + 0.1*C _b		250	ns
I²C Fast Mode—1.2-V Mode and 1.8-V Mode					
V _{IH}	Input high-level threshold	0.7 * vdds_dv_y ⁽²⁾		vdds_dv_y ⁽²⁾ + 0.5	V
V _{IL}	Input low-level threshold	–0.5		0.3 * vdds_dv_y ⁽²⁾	V
I _I	Input current at each I/O pin with an input voltage between 0.1 * vdds_dv_y ⁽²⁾ to 0.9 * vdds_dv_y ⁽²⁾	–10		10	μA
C _I	Input capacitance			10	pF
V _{OL3}	Output low-level threshold open-drain at 3-mA sink current	0		0.2 * vdds_dv_y ⁽²⁾	V
t _{OF}	Output fall time from V _{IHmin} to V _{ILmax} with a bus capacitance C _b from 5 pF to 400 pF	20 + 0.1*C _b		250	ns
t _{OR}	Output rise time from V _{ILmax} to V _{IHmin} with a capacitive load from 5 pF to 150 pF with internal pullup resistor enabled	20 + 0.1*C _b		250	ns
R _{INPU}	Internal pullup resistance for a given load range	LB[1:0] = 00	3.42	4.5 (for a load in the range of 5 pF to 15 pF)	6.8
		LB[1:0] = 01	1.6	2.1 (for a load in the range of 15 pF to 50 pF)	3.17
		LB[1:0] = 10	0.65	0.86 (for a load in the range of 50 pF to 150 pF)	1.3
		LB[1:0] = 11	NA	NA	NA
I²C High-Speed Mode—1.2-V Mode and 1.8-V Mode					
V _{IH}	Input high-level threshold	0.7 * vdds_dv_y ⁽²⁾		vdds_dv_y ⁽²⁾ + 0.5	V
V _{IL}	Input low-level threshold	–0.5		0.3 * vdds_dv_y ⁽²⁾	V
I _I	Input current at each I/O pin with an input voltage between 0.1 * vdds_dv_y ⁽²⁾ to 0.9 * vdds_dv_y ⁽²⁾	–10		10	μA

Table 3-10. I²C DC Electrical Characteristics (continued)

PARAMETER		MIN	NOM	MAX	UNIT	
C _I	Input capacitance			10	pF	
V _{OL3}	Output low-level threshold open-drain at 3-mA sink current	0		0.2 * vdds_dv_y ⁽²⁾	V	
t _{OF}	Output fall time from V _{IHmin} to V _{ILmax} with a capacitive load from 5 pF to 100 pF at 3-mA sink current	10		40	ns	
	Output fall time from V _{IHmin} to V _{ILmax} with a capacitive load of 400 pF at 3-mA sink current	20		80	ns	
t _{OR}	Output rise time from V _{ILmax} to V _{IHmin} with a capacitive load from 5 pF to 80 pF with internal pullup resistor enabled	10		40	ns

PARAMETER		MIN	NOM	MAX	UNIT
V _{OH}	Output high-level threshold (I _{OH} = –4 mA)	0.75 * vdds_dv_bank2			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.25 * vdds_dv_bank2	V
1.8-V Mode					
V _{IH}	Input high-level threshold	0.65 * vdds_dv_bank2		vdds_dv_bank2 + 0.3	V
V _{IL}	Input low-level threshold	–0.3		0.35 * vdds_dv_bank2	V
V _{HYS} ⁽³⁾	Input hysteresis voltage	150			mV
V _{OH}	Output high-level threshold (I _{OH} = –4 mA)	vdds_dv_bank2 – 0.45			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.45	V

(1) Output transition time measured between 20% to 80% of PAD voltage.

(2) In vdds_dv_y, y can have the value: bank1 or bank2 depending on the ball used. For more information on a ball and the corresponding power, see Table 2-1, POWER [9] column.

(3) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T–}.

(4) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.

3.3.8 McSPI DC Electrical Characteristics

Table 3-12 summarizes the McSPI dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (MB[1:0] and LB0, SC[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-12. McSPI DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT	
Signals in Mode 0: mcspi1_clk, mcspi1_somi, mcspi1_simo, mcspi1_cs[1:0] (Bottom Balls: AF22 / AE22 / AG22 / AE23 / AF23)

		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 670 ps	5		7	
		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 536 ps	2		11	

Table 3-13. UART DC Electrical Characteristics (continued)

PARAMETER			MIN	NOM	MAX	UNIT
t _{OT} ⁽⁴⁾	Output transition time (rise time, t _R or fall time, t _F) measured between 10% to 90% of PAD voltage, the maximum at the maximum load	MB[1:0] = 11 LB0 = 1 (Mode1) maximum frequency = 24 MHz transmission line delay = 670 ps			10	ns
		MB[1:0] = 11 LB0 = 1 (Mode1) maximum frequency = 60 MHz transmission line delay = 335 ps			4	
		MB[1:0] = 01 LB0 = 0 (Mode2) maximum frequency = 25 MHz transmission line delay = 335 ps			5.6 ⁽¹⁾	
		MB[1:0] = 01 LB0 = 0 (Mode2) maximum frequency = 48 MHz transmission line delay = 536 ps			6.3	
		MB[1:0] = 10 LB0 = 1 (Mode3) maximum frequency = 20 MHz transmission line delay = 838 ps			10.5 ⁽¹⁾	
		MB[1:0] = 10 LB0 = 1 (Mode3) maximum frequency = 24 MHz transmission line delay = 670 ps			12.5	
		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 4 MHz transmission line delay = 1675 ps			16.8 ⁽¹⁾	
		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 670 ps			10	
		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 670 ps			12.2	
		MB[1:0] = 10 LB0 = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 536 ps			8 ⁽¹⁾	
1.2-V Mode						
V _{IH}	Input high-level threshold		0.65 * vdds_dv_y ⁽²⁾		vdds_dv_y ⁽²⁾ + 0.3	V
V _{IL}	Input low-level threshold		-0.3		0.35 * vdds_dv_y ⁽²⁾	V
V _{HYS} ⁽³⁾	Input hysteresis voltage		135			mV
V _{OH}	Output high-level threshold (I _{OH} = 2 mA) ⁽⁶⁾		0.75 * vdds_dv_y ⁽²⁾			V
V _{OL}	Output low-level threshold (I _{OL} = 2 mA) ⁽⁶⁾				0.25 * vdds_dv_y ⁽²⁾	V
1.8-V Mode						
V _{IH}	Input high-level threshold		0.65 * vdds_dv_y ⁽²⁾		vdds_dv_y ⁽²⁾ + 0.3	V
V _{IL}	Input low-level threshold		-0.3		0.35 * vdds_dv_y ⁽²⁾	V
V _{HYS} ⁽³⁾	Input hysteresis voltage		150			mV
V _{OH}	Output high-level threshold (I _{OH} = 2 mA) ⁽⁶⁾		vdds_dv_y ⁽²⁾ - 0.45 ⁽⁵⁾			V
V _{OL}	Output low-level threshold (I _{OL} = 2 mA) ⁽⁶⁾				0.45 ⁽⁵⁾	V

(1) Output transition time measured between 20% to 80% of PAD voltage.

(2) In vdds_dv_y, y can have the value: bank1 or bank5 depending on the ball used. For more information on a ball and the corresponding power, see [Table 2-1](#), POWER [9] column.

(3) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}.

(4) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.

(5) For uart4_rx ball (AG20) and uart4_tx ball (AH19):
V_{OH} = vdds_dv_y - 0.3 V and V_{OL} = 0.3 V for I_{OH} = 1 mA
V_{OH} = vdds_dv_y - 0.2 V and V_{OL} = 0.2 V for I_{OL} = 250 μA

(6) This IO buffer supports up to 4 mA of drive strength. For this drive strength, the V_{OL}/V_{OH} described in the table above are not assured.

3.3.10 USB DC Electrical Characteristics

Table 3-14 summarizes the USB dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (DS0, MB[1:0], i[2:0], sr[1:0], SPEEDCTRL), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-14. USB DC Electrical Characteristics

V _{IL}	Input low-level threshold		–0.3		0.25 * vdds_1p8v	V
V _{HYS} ⁽¹¹⁾	Input hysteresis threshold		50			mV
V _{OH}	Output high-level threshold with 100-μA sink current at vdds minimum		0.75 * vdds_1p8v			V
V _{OL}	Output low-level threshold with 100-μA source current at vdds minimum				0.125 * vdds_1p8v	V
t _{TIN}	Input transition time (t _{RIN} or t _{FIN} evaluated between 10% and 90% at PAD)				10	ns
t _{OT}	Output transition time at 30-pf load (rise time, t _{ROUT} or fall time, t _{FOUT}), measured between 10% to 90% of PAD voltage	High-Speed SPEEDCTRL = 1			3	ns
	Output transition time at 30-pf load (rise time, t _{ROUT} or fall time, t _{FOUT}), measured between 30% to 70% of PAD voltage	Normal SPEEDCTRL = 0			8	ns
C _{LOAD}	Load capacitance		10		30	pF

- (1) Output transition time measured between 20% to 70% of PAD voltage
- (2) Output transition time measured between 20% to 80% of PAD voltage
- (3) Output transition time measured between 10% to 90% of PAD voltage
- (4) In vdds_dv_y, y can have the value: bank0 or bank6 depending on the ball used. For more information on a ball and the corresponding power, see [Table 2-1](#), POWER [9] column.
- (5) Buffer is designed for high-speed application where input slew rates are more than 1 V/ns. It is fast enough to not have any noise on the signal during transition and hysteresis is not required.
- (6) R_{REF} (reference output impedance) is considered to be the production trim setting for Drv8 mode, with R_{REF} = 50 Ω, which corresponds to Z_O = 50 Ω (I_{OUT} = 8 mA). For a full description of the output impedance setting, see the the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.
- (7) To achieve optimal noise/speed trade off, the slew rate (turn-on time) of the output signal can be programmed using the slew rate control bits sr[1:0]. The control bits sr[1:0] do not affect the driver DC drive-strength. They only control the driver turn-on time. It is to be noted that turn-on time and maximum supply noise are the parameters defined to help user make relative comparison and correlate the driver operation at different turn-on time settings.
- (8) Output transition time/turn-on time for Drv8 setting, i[2:0] = 011. For a full description of this setting, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.
- (9) Maximum noise (peak-peak) on the IO supply voltage for Drv8 setting, i[2:0] = 011.
- (10) The measurement setup (see [Figure 3-1](#) and [Figure 3-2](#)) is not intended as a precise representation of any particular system environment or a depiction of the actual load presented. Maximum output supply noise, (see [Figure 3-2](#), L*di/dt) on the IO supply is measured with 1 nH of inductance on the IO supply.
- (11) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}.
- (12) The GPIO modes are only available through multiplexing mode 1 or 2. For more information, see [Table 2-1](#).

3.3.11 MMC/SDIO DC Electrical Characteristics

Table 3-15 summarizes the MMC/SDIO dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (SPEEDCTRL, MB[1:0] and LB0), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-15. MMC/SDIO DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT

		MB[1:0] = 10 LBO = 0 (Mode4) maximum frequency = 25 MHz transmission line delay = 536 ps		8 ⁽¹⁾	
1.2-V Mode					
V_{IH}	Input high-level threshold	0.65 * vdds_dv_bank4		vdds_dv_bank4 + 0.3	V
V_{IL}	Input low-level threshold	-0.3		0.35 * vdds_dv_bank4	V
$V_{HYS}^{(2)}$	Input hysteresis voltage	135			mV
V_{OH}	Output high-level threshold ($I_{OH} = 4$ mA)	0.75 * vdds_dv_bank4			V
V_{OL}	Output low-level threshold ($I_{OL} = 4$ mA)			0.25 * vdds_dv_bank4	V
1.8-V Mode					
V_{IH}	Input high-level threshold	0.65 * vdds_dv_bank4		vdds_dv_bank4 + 0.3	V
V_{IL}	Input low-level threshold	-0.3		0.35 * vdds_dv_bank4	V
$V_{HYS}^{(2)}$	Input hysteresis voltage	150			mV
V_{OH}	Output high-level threshold ($I_{OH} = 4$ mA)	vdds_dv_bank4 - 0.45			V
V_{OL}	Output low-level threshold ($I_{OL} = 4$ mA)			0.45	V

(1) Output transition time measured between 20% to 80% of PAD voltage.

(2) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-} .

(3) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.

3.3.12 JTAG DC Electrical Characteristics

Table 3-16 summarizes the JTAG dc electrical characteristics in multiplexing mode 0.

Table 3-16. JTAG DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT
Signals in Mode 0: jtag_nrst, jtag_tck, jtag_rtck, jtag_tms_tmso, jtag_tdi, jtag_tdo (Bottom Balls: AH2 / AG1 / AE3 / AH1 / AE1 / AE2)					
C _{LOAD}	Load capacitance		30		pF
t _{OR}	Output rise time		5.5		ns
t _{OF}	Output fall time		5.7		ns
1.8-V Mode					
V _{IH}	High-level input voltage	0.65 * vdds_1p8v		vdds_1p8v + 0.3	V
V _{IL}	Low-level input voltage	-0.3		0.35 * vdds_1p8v	V
V _{OH}	High-level output voltage (I _{OH} = -4 mA)	vdds_1p8v - 0.45			V
V _{OL}	Low-level output voltage (I _{OL} = 4 mA)			0.45	V
V _{HYS} ⁽¹⁾	Hysteresis voltage at an input	150			mV

(1) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}.

3.3.13 DPM DC Electrical Characteristics

Table 3-17 summarizes the DPM dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (DS0), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-17. DPM DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT

V _{OL}	Output low-level threshold (I _{OL} = 4 mA for 50Ω mode, I _{OL} = 8 mA for 25Ω mode)				0.45	V

(1) Output transition time measured between 20% to 70% of PAD voltage.

(2) Output transition time measured between 20% to 80% of PAD voltage.

(3) Output transition time measured between 10% to 90% of PAD voltage.

(4) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}.

3.3.14 Keypad DC Electrical Characteristics

Table 3-18 summarizes the keypad dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (SC[1:0]), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-18. Keypad DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT	
Signals in Mode 0: kpd_col[5:0], kpd_row[5:0] (Bottom Balls: G26 / G25 / H26 / H25 / J27 / H27 / J26 / J25 / K26 / K25 / L27 / K27)						
C _{LOAD}	Load capacitance	SC[1:0] = 00	4		60	pF
		SC[1:0] = 01	2		21	
		SC[1:0] = 10	7		33	
t _{OT}	Output transition time (rise time, t _R or fall time, t _F) measured between 10% to 90% of PAD voltage, minimum at the minimum load and maximum at the maximum load	SC[1:0] = 00	1		15	ns
		SC[1:0] = 01	0.4		5	
		SC[1:0] = 10	0.6		7	
1.2-V Mode						
V _{IH}	Input high-level threshold	0.65 * vdds_dv_bank7		vdds_dv_bank7 + 0.3	V	
V _{IL}	Input low-level threshold	−0.3		0.35 * vdds_dv_bank7	V	
V _{HYS} ⁽¹⁾	Input hysteresis voltage	135			mV	
V _{OH}	Output high-level threshold (I _{OH} = −4 mA)	0.75 * vdds_dv_bank7			V	
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.25 * vdds_dv_bank7	V	
1.8-V Mode						
V _{IH}	Input high-level threshold	0.65 * vdds_dv_bank7		vdds_dv_bank7 + 0.3	V	
V _{IL}	Input low-level threshold	−0.3		0.35 * vdds_dv_bank7	V	
V _{HYS} ⁽¹⁾	Input hysteresis voltage	150			mV	
V _{OH}	Output high-level threshold (I _{OH} = −4 mA)	vdds_dv_bank7 − 0.45			V	
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.45	V	

(1) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T−}.

3.3.15 System DC Electrical Characteristics

Table 3-19 summarizes the system dc electrical characteristics in multiplexing mode 0.

NOTE

For more information on the IO cell configurations (SC[1:0], MB[1:0] and LB0), see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.

Table 3-19. System DC Electrical Characteristics

PARAMETER		MIN	NOM	MAX	UNIT
Signals in Mode 0: sys_nrespwrn, sys_nreswarm (Bottom Balls: AE7, AF7)					
1.8-V Mode					
V _{IH}	Input high-level threshold	0.65 * vdds_1p8v		vdds_1p8v + 0.3	V
V _{IL}	Input low-level threshold	–0.3		0.35 * vdds_1p8v	V
V _{HYS} ⁽⁴⁾	Input hysteresis voltage	150			mV
V _{OH}	Output high-level threshold (I _{OH} = –4 mA)	vdds_1p8v – 0.45			V
V _{OL}	Output low-level threshold (I _{OL} = 4 mA)			0.45	V
Signals in Mode 0: fref_clk_ioreq, sys_32k, sys_pwr_req, sys_pwrn_reset_out, sys_boot[7:6] (Bottom Balls: AD1 / AG7 / AH7 / AG6 / AF8 / AE8)

C_{LOAD}	Load capacitance	12		24	pF
Signal in Mode 0: fref_slicer_in (Bottom Ball: AG8)					

Table 3-19. System DC Electrical Characteristics (continued)

PARAMETER		MIN	NOM	MAX	UNIT
Single-ended Application Mode (single-ended sine clock)					
V _{SWING}	Input voltage swing ⁽⁶⁾	500		1600	mV _{PP}
R _{IN}	Input resistance		18.3		kΩ
C _{IN}	Input capacitance			2.5	pF
Single-ended High-Voltage CMOS Application Mode (single-ended square clock)					
V _{IH}	Input high-level threshold	0.65 * vdds_1p8_fref		2.00	V
V _{IL}	Input low-level threshold	-0.2		0.35 * vdds_1p8_fref	V
R _{IN}	Input resistance		18.3		kΩ
C _{IN}	Input capacitance			2.5	pF
t _T	Input transition time (rise time, t _R or fall time, t _F) measured between 10% to 90% of PAD voltage	1.5		10	ns

- (1) In vdds_y, y can have the value: vdds_1p8_fref or vdds_1p8v depending on the ball used. For more information on a ball and the corresponding power, see [Table 2-1](#), POWER [9] column.
- (2) In vdds_w, w can have the value: vdds_1p8_fref or vdds_dv_fref depending on the ball used. For more information on a ball and the corresponding power, see [Table 2-1](#), POWER [9] column.
- (3) Output transition time measured between 20% to 80% of PAD voltage.
- (4) V_{HYS} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}.
- (5) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.
- (6) Minimum input common mode voltage – input voltage swing/2 > 0 V
Maximum input common mode voltage + input voltage swing/2 < 1.6 V

3.4 External Capacitors

3.4.1 Voltage Decoupling Capacitors

To improve module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

NOTE

- The SMPS1 feedback sense line is taken at the OMAP capacitor or at the SMPS1 capacitor.
- For the other SMPS, the feedback sense is taken at the SMPS capacitor.
- For more information on PMIC bulk capacitors, see the TWL6032 data manual, *Electrical Characteristics* chapter, *SMPS1 Switched-Mode Regulator Electrical Characteristics* table.
- The additional mid-frequency decoupling capacitors are described in [Table 3-20](#), *Core, MPU, IVA, Audio Voltage Decoupling Characteristics*.

3.4.1.1 Core, MPU, IVA, Audio Voltage Decoupling

[Table 3-20](#) summarizes the core voltage decoupling characteristics.

CAUTION

PCB guideline between the power IC (PMIC) balls and the OMAP balls:

- Maximum recommended inductance by power supply rail less than 2 nH (VDD + VSS).
- Maximum recommended static IR-drop by power supply rail less than 1.5% (with rise on ground accounted for).
- For more information on maximum peak-peak noise on the supply, see [Table 3-3](#), *Recommended Operating Conditions*.
- Main characteristics of the decoupling bypass capacitors are:
 - Size code:
 - 10 μ F: 0603/X5R
 - 4.7 μ F: 0603/X5R
 - 1 μ F: 0402/X5R
 - 470 nF: 0402/X5R
 - 100 nF: 0201/X5R
 - Minimum value for each PCB capacitor: 100 nF
 - ESL decoupling capacitor must not exceed 0.5 nF
 - The capacitor value is defined at $\pm 50\%$ of the value to take in account the aging effects, and the voltage impact.
 - Among the different capacitors, 470 nF is recommended (not required) to filter at 5-MHz to 10-MHz frequency range

Table 3-20. Core, MPU, IVA, Audio Voltage Decoupling Characteristics⁽²⁾

PARAMETER				PDN IMPEDANCE CHARACTERISTICS ⁽¹⁾		PCB RES. BETWEEN SPMS and OMAP (mΩ)	MAXIMUM LOOP INDUCT. PER CAPACITOR (WITHOUT ESL) ⁽²⁾ (nH)	DECOUPLING CAPACITOR VALUES				
POWER	OPP ⁽³⁾	MAXIMUM DYNAMIC CURRENT (mA)	VOLTAGE (V)	IMPED. TARGET (mΩ)	FREQ. RANGE OF INTEREST (MHz)			100 nF (ESL < 0.25 nH)	470 nF (ESL < 0.25 nH)	1 μF (ESL < 0.35 nH)	2.2 μF (ESL < 0.35 nH)	4.7 μF (ESL < 0.4 nH)
vdd_mpu	OPPNTSB (MPU @ 1500 MHz)	1240	1.38	56	37	4.6	0.4	5	2	3	1	1
	OPPNT (MPU @ 1300 MHz)	1080	1.29	60	39	5	0.4	5	2	3	1	1
vdd_iva_audio	OPPNTSB	550	1.375	125	50	18	0.7	5	1	1	0	0
vdd_core	OPP119	900	1.25	69	50	10	0.7	5	1	3	0	1

(1) Impedance target by ball until 30 MHz.

(2) See [Table 3-3](#) for more information on peak-to-peak noise values.

(3) See DM Operating Condition Addendum for CORE OPP voltages and frequencies.

3.4.1.2 IO Voltage Decoupling

[Table 3-21](#) summarizes the IO voltage decoupling characteristics.

CAUTION

PCB guideline between the power IC (PMIC) balls and the OMAP balls:

- Maximum recommended static ir-drop by power supply rail less than 1% of the supplied voltage.
- For more information on maximum peak-peak noise on the supply, see [Table 3-3, Recommended Operating Conditions](#).
- Decoupling bypass capacitors main characteristics:
 - TCC size code:
 - 470 nF: 0402/X5R
 - 220 nF: 0402/X5R
 - 100 nF: 0201/X5R
 - Minimum value for each PCB capacitor: 100 nF
 - The capacitor value is defined at $\pm 50\%$ of the value to take in account the aging effects, and the voltage impact.

Table 3-21. IO Voltage Decoupling Characteristics⁽¹⁾⁽²⁾

PARAMETER	MIN ⁽⁴⁾	TYP	MAX ⁽⁴⁾	UNIT
1.2-V Supply Voltage IOs				
C _{vdds_1p2v}	50	100	150	nF
1.8-V Supply Voltage IOs				
C _{vdds_1p8v}	160	220 + 100	480	nF
C _{vdds_1p8_fref}	50	100	150	
1.2-V, 1.8-V Supply Voltage IOs				
C _{vdds_dv_gpmc}	300	6 x 100	900	nF
C _{vdds_dv_sdmmc2}				
C _{vdds_dv_c2c}				
C _{vdds_dv_cam}				
C _{vdds_dv_bank0}				
C _{vdds_dv_bank1}				
C _{vdds_dv_bank2}				
C _{vdds_dv_bank3}				
C _{vdds_dv_bank4}				
C _{vdds_dv_bank5}				
C _{vdds_dv_bank6}				
C _{vdds_dv_bank7}				
C _{vdds_dv_fref}				
1.8-V, 3.3-V SDMMC1 Supply Voltage IOs				
C _{vdds_sdmmc1}	50	100	150	nF
1.2-V LPDDR2 Supply Voltage IOs				
C _{vddq_lpddr2}	800	2 x 470 + 6 x 100	2400	nF
C _{vddq_vref_lpddr2} ⁽³⁾	50	100	150	nF
C _{vddca_lpddr2}	285	1 x 100 + 1 x 470	855	nF
C _{vddca_vref_lpddr2} ⁽³⁾	50	100	150	nF
Other				
vpp_cust ⁽⁵⁾		100		nF

(1) All capacitor values described in this table are based on capacitors of 100 nF.

(2) See [Table 3-3](#) for more information on peak-to-peak noise values.

(3) vddq_vref_lpddr2 and vddca_vref_lpddr2 are dedicated power supplies for OMAP embedded VREF generator.

(4) To take into account the aging effects and voltage impact on capacitance, their values, as described in [Table 3-21](#), are specified at ± 50%.

(5) vpp_cust is only powered when programming CPFROM eFuses. Otherwise, it is recommended to leave vpp_cust turned off (floating).

If the TWL6032 PMIC is used then the vpp pulldown resistor inside the TWL6032 must be disabled when vpp_cust is turned off.

3.4.1.3 Analog Voltage Decoupling

3.4.1.3.1 Analog Voltage Decoupling Values

Table 3-22 summarizes the analog voltage decoupling characteristics.

CAUTION	
PCB guidelines between the power IC (PMIC) balls and the OMAP balls:	
<ul style="list-style-type: none"> • Maximum recommended inductance ($V_{DDA} + V_{SSA}$) by power supply rail less than 30 nH. • The capacitors must be placed as closed as possible to the balls. Maximum loop inductance for the decoupling capacitances must not exceed: <ul style="list-style-type: none"> – 1.0 nH maximum for DLLs – 1.5 nH maximum for complex IOs (HDMI) and DPLLs – 2.0 nH maximum for SRAM LDOs, BodyBias (BB) LDOs, WakeUp (WKUP) LDO, BandGap (BG) LDO, CSI2, CCPV2, and DSI • Maximum recommended resistance ($V_{DDA} + V_{SSA}$) by power supply rail between 0.1 Ω to 0.3 Ω. • For more information on HDMI routing guidelines, see Figure 3-3, HDMI Power PCB Routing Topology. • For more information on DPLLs and complex IOs routing guidelines, see Figure 3-4, DPLLs / Complex I/O VDDA Power PCB Routing Topology. • For more information on OMAP4 embedded LDOs and BandGap routing guidelines, see Figure 3-5, OMAP Embedded LDO / Bandgap Power PCB Routing Topology.

- (1) Decoupling capacitance side code (TCC): 0402/X5R.
- (2) See [Table 3-3](#) for more information on peak-to-peak noise values.
- (3) To take into account the aging effects and voltage impact on capacitance, their values, as described in [Table 3-22](#), are specified at $\pm 50\%$.
- (4) In [Figure 3-6](#) and [Figure 3-7](#), *External Capacitors*, the three DLL decoupling capacitors have the names: $C_{vdda_dll1/3}$, $C_{vdda_dll2/3}$, and $C_{vdda_dll3/3}$ to represent the three decoupling capacitors above the four power rails: $vdda_dll0_lpddr21$, $vdda_dll1_lpddr21$, $vdda_dll0_lpddr22$, and $vdda_dll1_lpddr22$.

3.4.1.3.2 Analog Voltage Decoupling—Example Of HDMI Routing Guidelines

The VDAC LDO within the TWL6032 PMIC device supplies the HDMI ($vdda_hdmi$ OMAP4 power pin) circuitry within the OMAP4 device. This power rail must be routed as a power trace from the LDO where it is star-routed to OMAP as shown in [Figure 3-3](#), *HDMI Power PCB Routing Topology*.

For each power trace between the TWL6032 PMIC device and OMAP4 $vdda_hdmi$:

- Maximum recommended resistance (VDDA + VSSA) by power supply rail must be 0.3Ω .
- Maximum recommended inductance by power supply rail less than 2 nH (VDD + VSS) must be 30 nH

Each decoupling capacitor must be located as close as possible to the OMAP4 power balls to reduce the decoupling capacitor loop inductance:

- Maximum loop inductance for the decoupling capacitors must not exceed:
 - HDMI: less than 1.5 nH between their location on trace and the devices power balls

SWPS045-020

Figure 3-3. HDMI Power PCB Routing Topology

3.4.1.3.3 Analog Voltage Decoupling—Example Of VCXIO and VUSB Routing Guidelines

This section provides an example of VCXIO and VUSB routing guidelines based on a TWL6032 PMIC.

The TWL6032 PMIC power companion provides an LDO (VCXIO) that is used to power the DPLLs within the OMAP4 device, as well as the VDDA inputs to the complex I/O cells (except HDMI) used within the OMAP4.

Another LDO VUSB provides the 3.3-V supply for the USBPHY (to the OMAP4 $vdda_usba0otg_3p3v$ power pin).

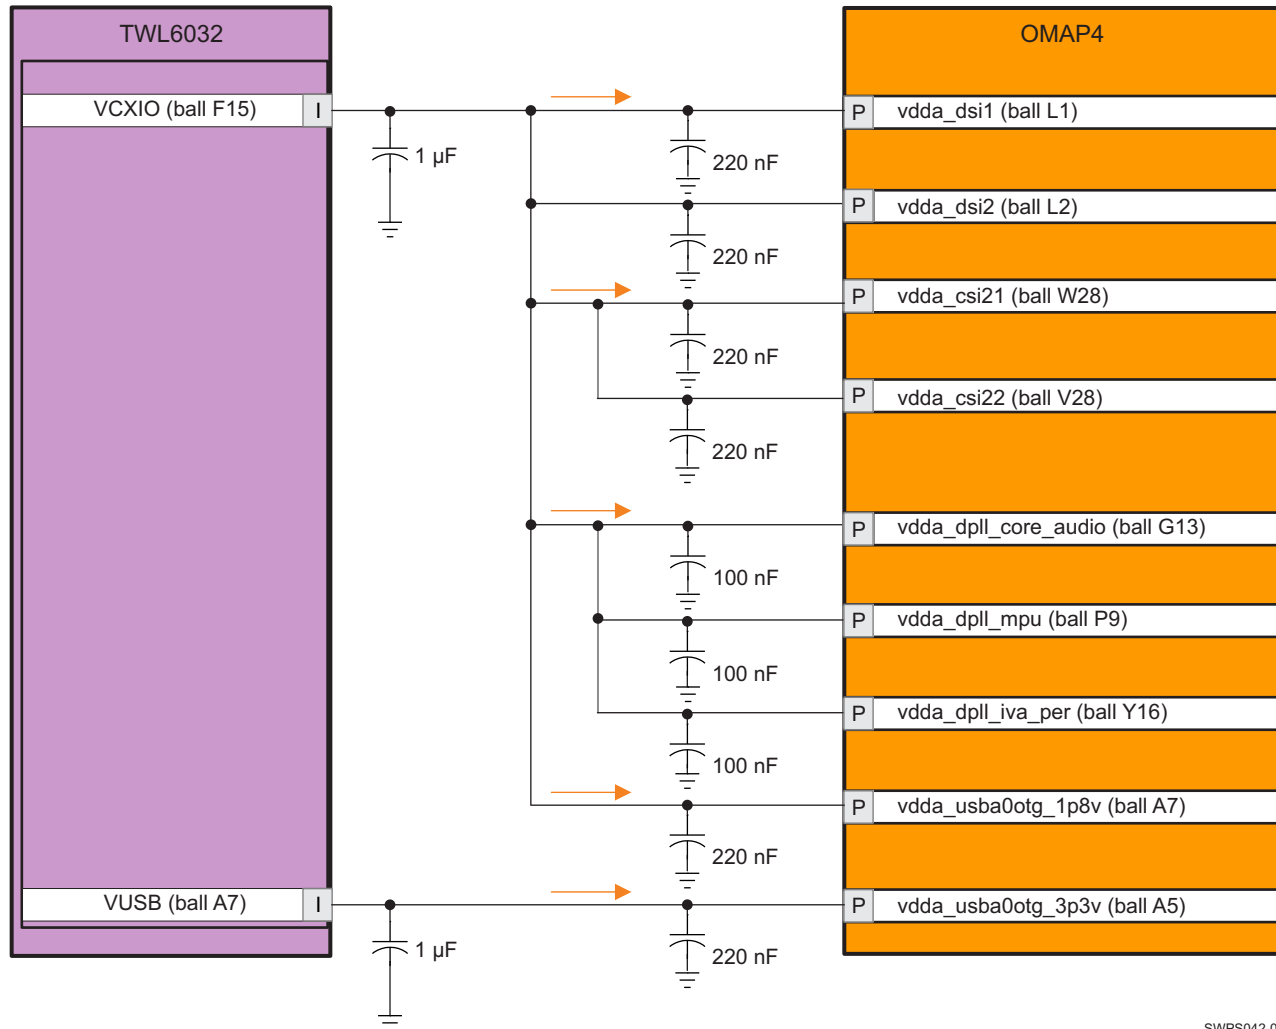

Both LDOs must be routed as a power trace and star-routed to the OMAP4 as shown in [Figure 3-4](#), *DPLLs / Complex I/Os VDDA Power PCB Routing Topology*.

For each power trace between TWL6032 PMIC device and the DPLLs, complex IOs power balls:

- Maximum recommended resistance (VDDA + VSSA) by power supply rail must be 0.3Ω .
- Maximum recommended inductance by power supply rail less than 2 nH (VDD + VSS) must be 30 nH

Each decoupling capacitor must be located as close as possible to the OMAP4 power balls to reduce the decoupling capacitor loop inductance:

- Maximum loop inductance for the decoupling capacitors must not exceed:
 - Complex IOs: less than 2 nH between their location on trace and the device power balls
 - DPLLs: less than 1.5 nH between their location on trace and the devices power balls

SWPS042-021

Figure 3-4. DPLLs / Complex I/Os VDDA Power PCB Routing Topology

3.4.1.3.4 Analog Voltage Decoupling—Example Of OMAP4 Embedded LDOs / BandGap Routing Guidelines

This section provides an example of OMAP4 embedded LDOs / BandGap routing guidelines based on a TWL6032 PMIC.

The TWL6032 PMIC power companion provides an SMPS that supplies the IOs and the power management IPs within the OMAP4 device.

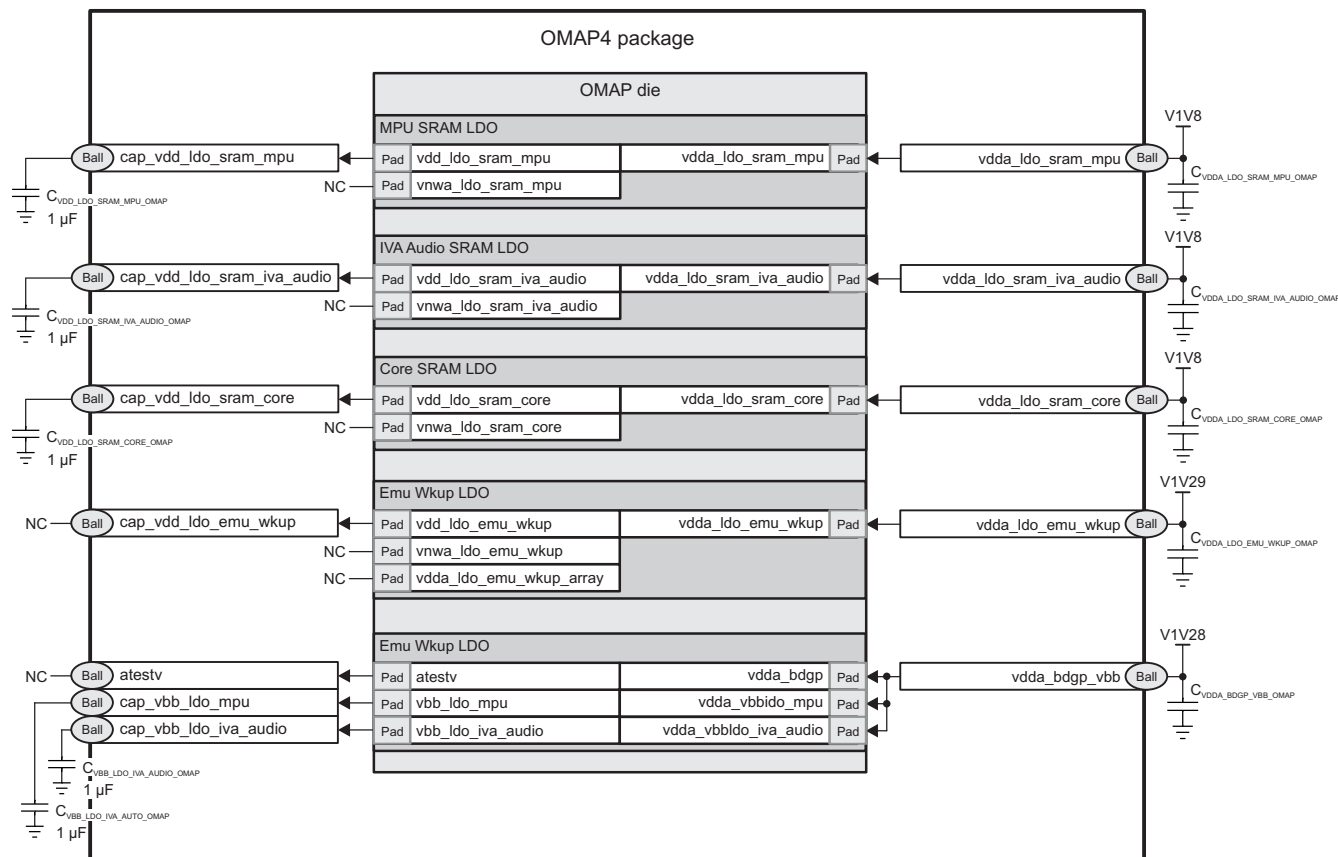

This section describes only PCB requirements for embedded OMAP4 LDOs and Bandgap that supply the memories inside the OMAP4.

Both LDOs must be routed as a power trace and star-routed to the OMAP4 as shown in [Figure 3-5, OMAP Embedded LDO / Bandgap Power PCB Routing Topology](#). For each power trace between TWL6032 PMIC device and the DPLLs, complex IOs power balls:

- Maximum recommended resistance (VDDA + VSSA) by power supply rail must be 0.3 Ω .
- Maximum recommended inductance by power supply rail less than 2 nH (VDD + VSS) must be 30 nH

Each decoupling capacitor must be located as close as possible to the OMAP4 power balls to reduce the decoupling capacitor loop inductance:

- Maximum loop inductance for the decoupling capacitors must not exceed:
 - Complex IOs: less than 2 nH between their location on trace and the device power balls
 - DPLLs: less than 1.5 nH between their location on trace and the devices power balls

SWPS042-008

Figure 3-5. OMAP Embedded LDO / Bandgap Power PCB Routing Topology

3.4.1.3.4.1 Analog Voltage Decoupling—Example Of Routing Guidelines For Power Supplies

The SMPS must be routed as a power trace and star-routed to the OMAP4 balls.

Dedicated power traces are star connected from the V1V8 power ball to OMAP4 power balls vdda_ldo_sram_mpu, vdda_ldo_sram_iva_audio, vdda_ldo_sram_core, vdda_ldo_emu_wkup, and vdda_bdgp_vbb:

- Maximum recommended resistance (VDDA + VSSA) by power supply rail must be 0.3 Ω.
- Maximum recommended inductance by power supply rail less than 2 nH (VDD + VSS) must be 30 nH.

Each decoupling capacitor must be located as close as possible to the OMAP4 power balls to reduce the decoupling capacitor loop inductance.

Maximum loop inductance for the decoupling capacitors must not exceed 2 nH.

3.4.1.3.4.2 Analog Voltage Decoupling—Guidelines For Embedded DLLs

The total capacitors for the 4 DLL power supplies balls (vdda_dli0_lpddr21, vdda_dli1_lpddr21, vdda_dli0_lpddr22, vdda_dli1_lpddr22) must be 3 x 100 nF.

The capacitors must be placed as closed as possible to the balls.

Maximum loop inductance for the decoupling capacitances must not exceed 1 nH.

3.4.1.3.4.3 Analog Voltage Decoupling—Guidelines For Top LPDDR2 Memories Core Power Supplies

The OMAP4 device supports two LPDDR2 channels. Each of these channels supports up to two chip selects and up to four LPDDR2 memory dies can be connected on top of OMAP4 package in a Package on Package [POP] implementation. Power for LPDDR2 memory are connected via feedthrough in the OMAP4 package.

Depending upon the LPDDR2 memory configuration, T.I. recommends contacting Memory Vendors for the proper decoupling scheme. As a reference point based on TI board, LPDDR2 VDD1 has 3 x 100 nF and LPDDR2 VDD2 has 2 x 470 nF + 3 x 100 nF.

3.4.2 Output Capacitors

The capacitors at outputs are required to stabilize the internal LDO supply voltages. The capacitors must be placed as closed as possible to the balls.

Table 3-23 summarizes the output capacitor characteristics.

CAUTION	
PCB guidelines:	
<ul style="list-style-type: none"> • The capacitors must be placed as closed as possible to the balls. Maximum loop inductance for the decoupling capacitances must not exceed: <ul style="list-style-type: none"> – 1 nH maximum for output SRAM LDOs. – 3 nH maximum for output BodyBias (BB) LDOs. 	

Table 3-23. Output Capacitor Characteristics⁽¹⁾

PARAMETER	MIN ⁽³⁾	TYP	MAX ⁽³⁾	UNIT
C _{cap_vbb_ldo_mpu}	0.7	1.0	1.3	μF
C _{cap_vbb_ldo_iva_audio}	0.7	1.0	1.3	μF
C _{cap_vdd_ldo_sram_mpu}	0.7	1.0	1.3	μF
C _{cap_vdd_ldo_sram_iva_audio}	0.7	1.0	1.3	μF
C _{cap_vdd_ldo_sram_core}	0.7	1.0	1.3	μF
C _{cap_vdd_ldo_emu_wkup}	NA ⁽²⁾	NA ⁽²⁾	NA ⁽²⁾	NA ⁽²⁾

(1) Output capacitors side code (TCC): 0402/X5R

(2) Caution: It is recommended to avoid adding any external capacitor.

(3) To take into account the aging effects and voltage impact on capacitance, their values, as described in Table 3-23, are specified at ± 50%.

Figure 3-6 and Figure 3-7 illustrate an example of external capacitors.

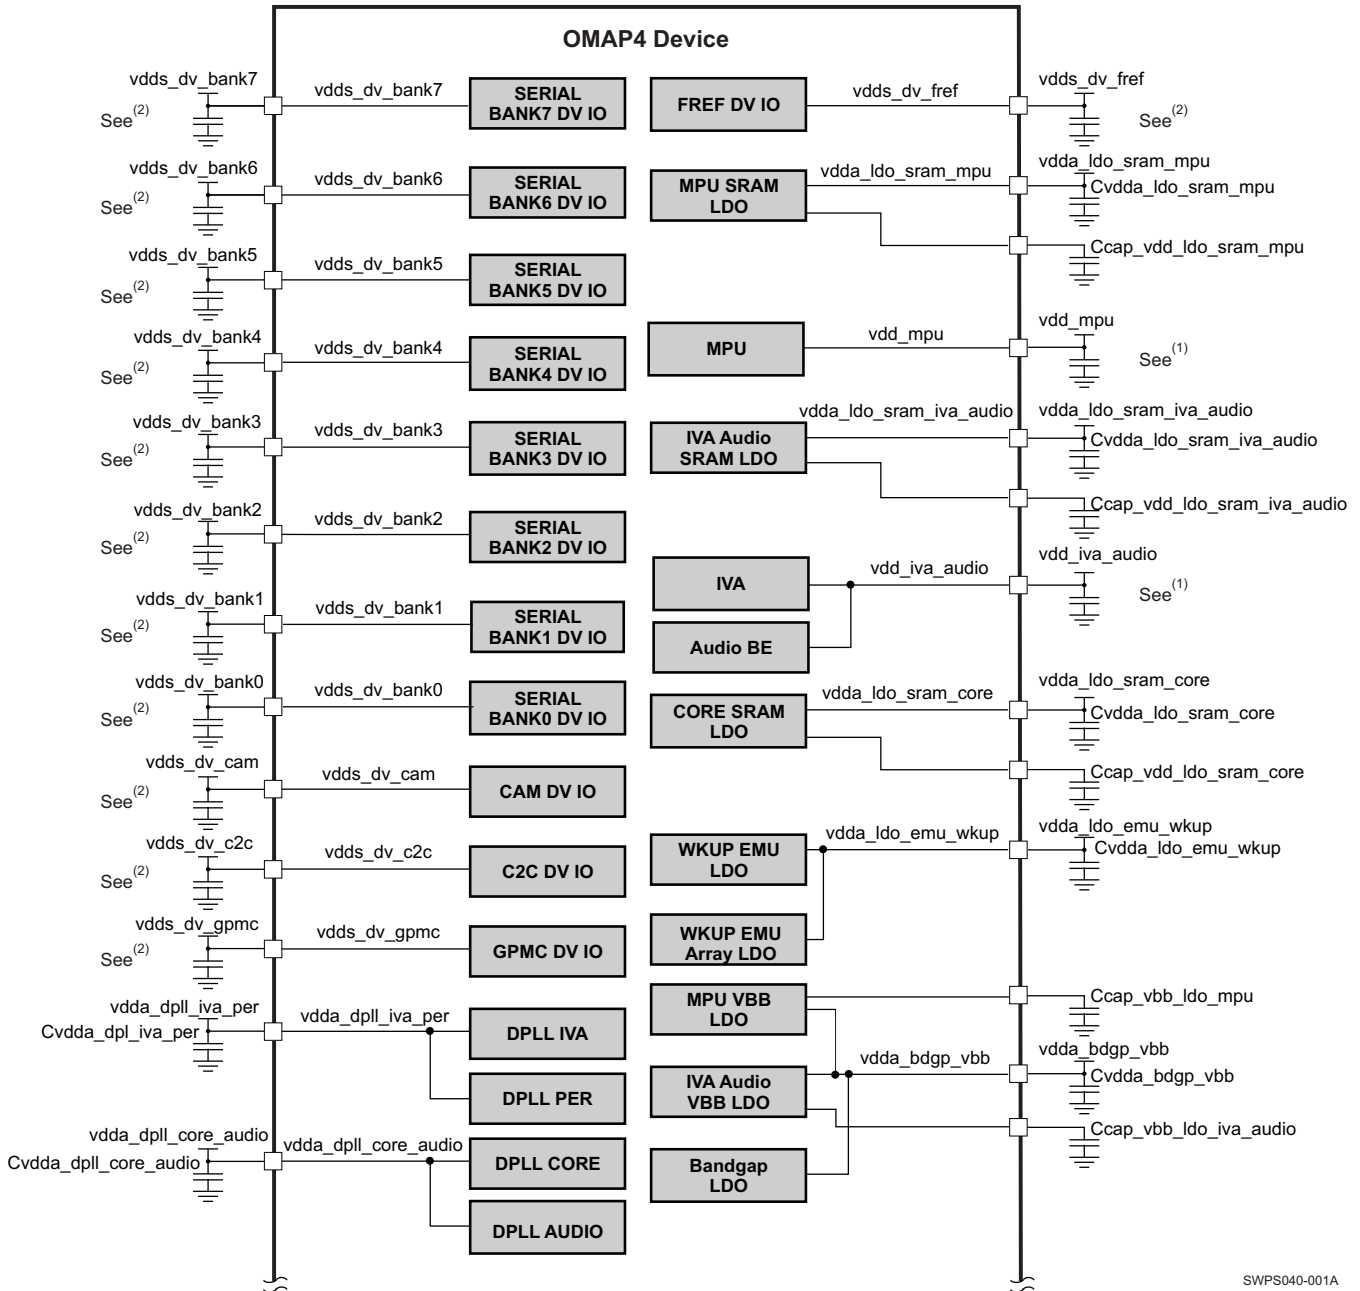

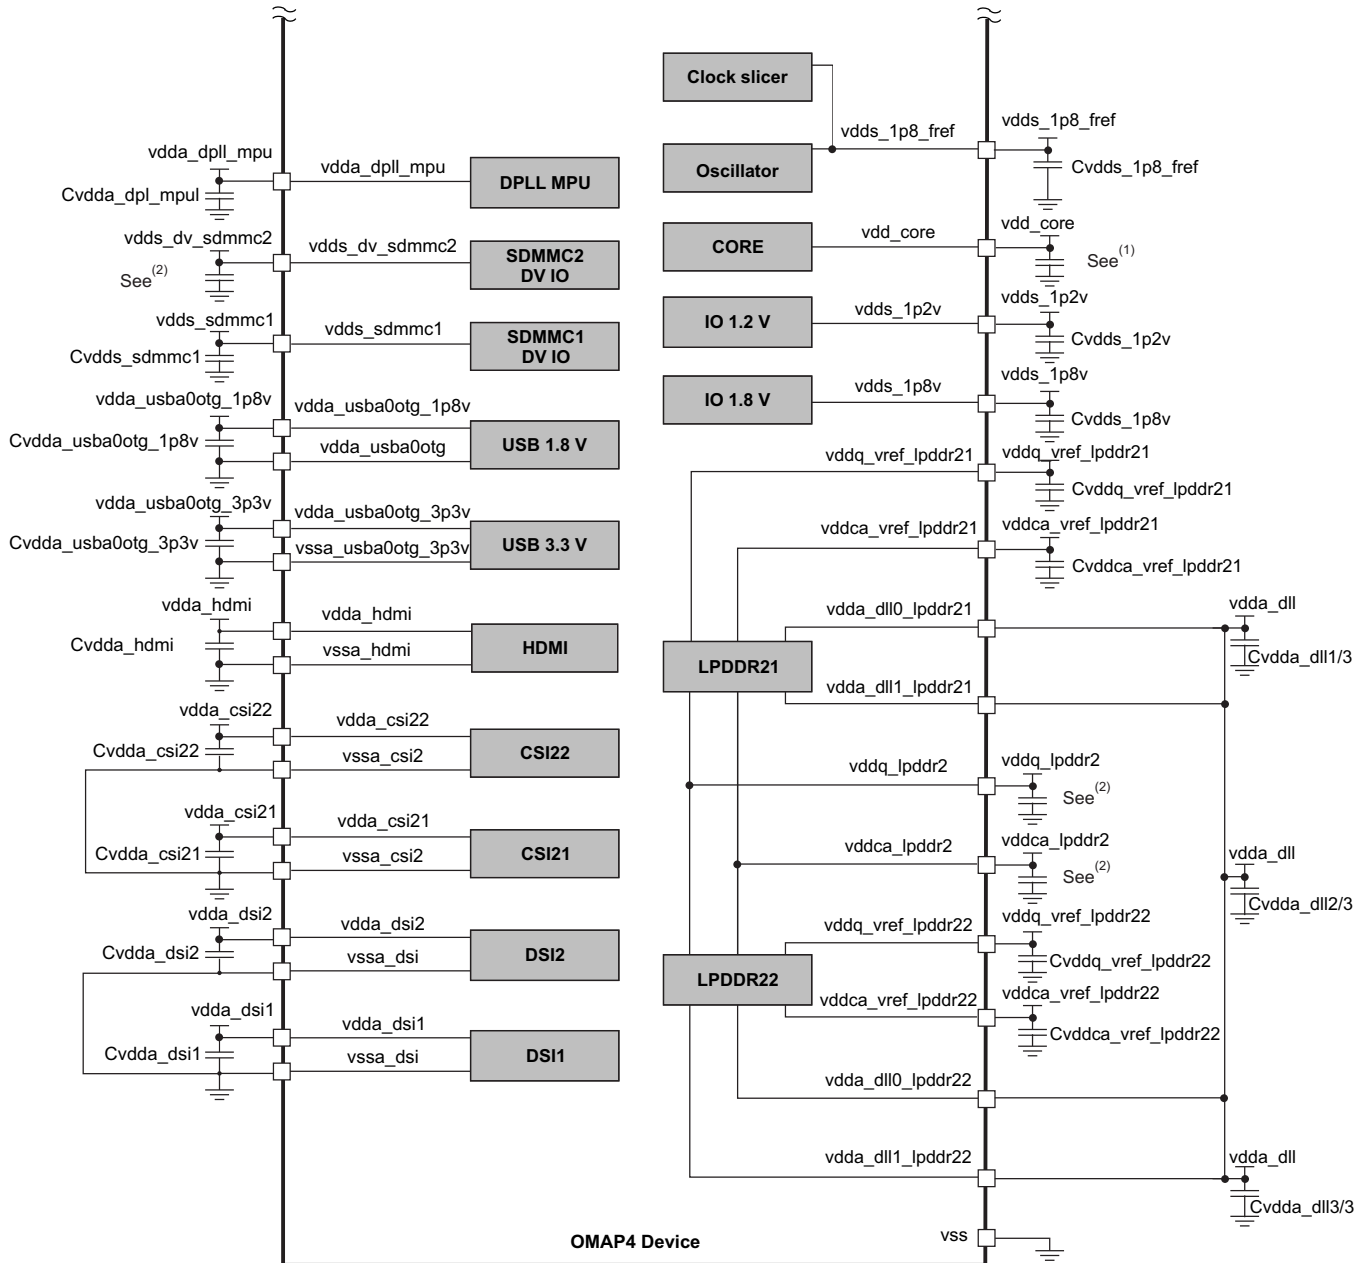

Figure 3-6. External Capacitors—Page 1 of 2⁽¹⁾⁽²⁾

- (1) The vdd_mpu, vdd_iva_audio and vdd_core decoupling capacitors placement depends on the board layout. The recommended number of decoupling capacitors is described in [Table 3-20, Core, MPU, IVA, Audio Voltage Decoupling Characteristics](#).
- (2) The decoupling capacitors placement of the gpmc, sdmmc2, c2c, cam, bank[7:0], fref VDDSD dual voltages (dv) depends on the board layout. The number of decoupling capacitors to be used is described in [Table 3-21, IO Voltage Decoupling Characteristics](#). Regarding the vddq_vref_lpddr2 and vddca_vref_lpddr2 decoupling capacitors requirement, see also [Table 3-21, IO Voltage Decoupling Characteristics](#).

SWPS045-007

Figure 3-7. External Capacitors—Page 2 of 2⁽¹⁾⁽²⁾

- (1) The vdd_mpu, vdd_iva_audio and vdd_core decoupling capacitors placement depends on the board layout. The recommended number of decoupling capacitors is described in [Table 3-20, Core, MPU, IVA, Audio Voltage Decoupling Characteristics](#).
- (2) The decoupling capacitors placement of the gpmc, sdmmc2, c2c, cam, bank[7:0], freq VDDS dual voltages (dv) depends on the board layout. The number of decoupling capacitors to be used is described in [Table 3-21, IO Voltage Decoupling Characteristics](#). Regarding the vddq_vref_lpddr2 and vddca_vref_lpddr2 decoupling capacitors requirement, see also [Table 3-21, IO Voltage Decoupling Characteristics](#).

NOTE

vddq_vref_lpddr21 and vddq_vref_lpddr22 are the supply voltage for LPDDR2 DQ VREF:

- Channel 1 on ball G15
- Channel 2 on ball T8

vddca_vref_lpddr21 and vddca_vref_lpddr22 are the supply voltage for LPDDR2 CA VREF:

- Channel 1 on ball Y14
- Channel 2 on ball R27

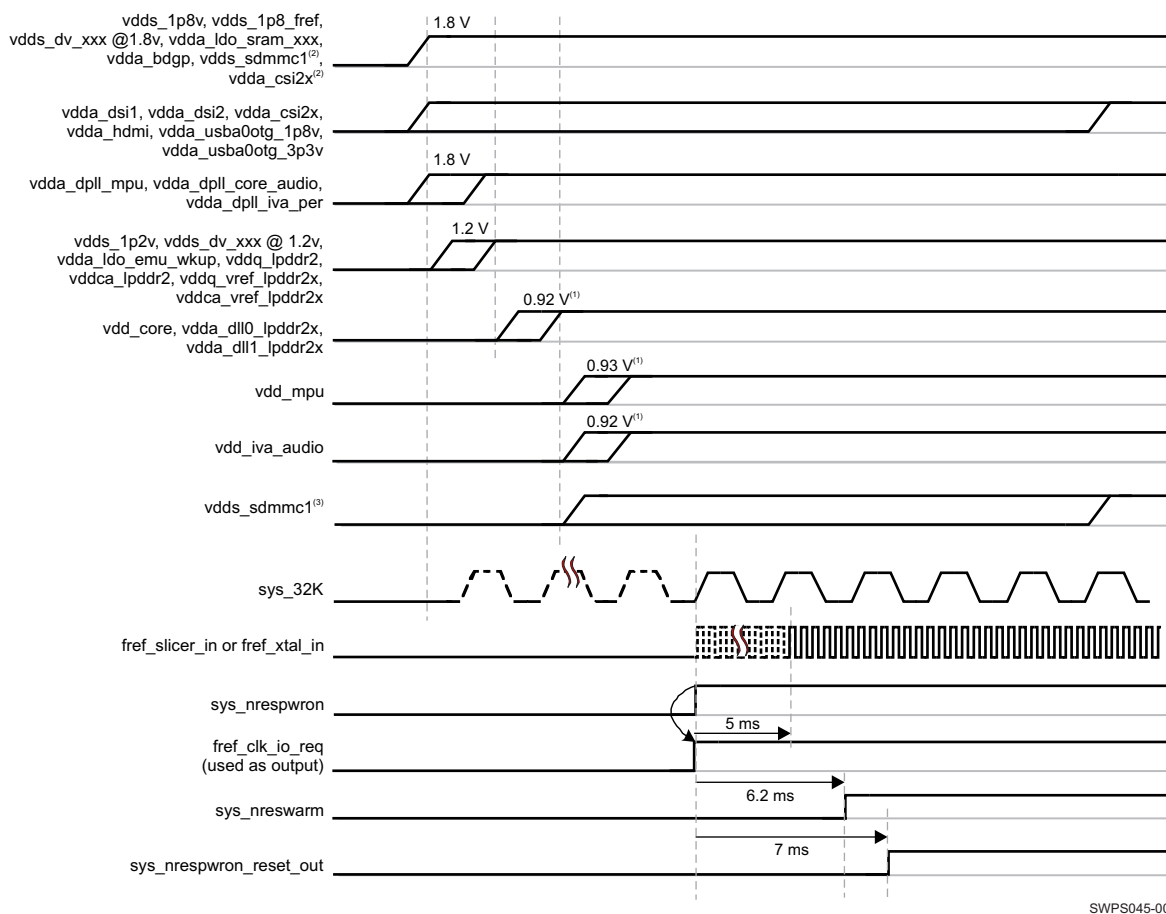

3.5 Power-up, Power-down and Power-off Sequences

3.5.1 Power-Up Sequence

NOTE

For more information, see Power, Reset and Clock Management / Reset Management Functional Description / Reset Sequences / PRCM Module Power-On Reset Sequence section of OMAP4470 TRM.

Figure 3-8 shows the power-up sequence.

SWPS045-008

Figure 3-8. Power-Up Sequence

- (1) For power saving, the OMAP4470 device boots up with vdd_core, vdd_mpu, and vdd_iva_audio @OPPBoot. See the operating condition addendum for values.
- (2) In case the SDMMC1 interface is used at 1.8 V only (for example, as GPIOs or for SDIO device or eMMC device...) or the CSI2

interfaces are used as GPIs.

- (3) In case the SDMMC1 functional signals are used at 1.8 V / 3.0 V.

NOTE

When supplied at 1.8 V, the vdds_dv_xxx dual-voltage supplies (xxx represents bank[7:0], gpmc, sdmmc2, c2c, cam, freq) must be turned on before the one supplied at 1.2 V. Only exception is vdds_dv_c2c that can be turned on at any time (including after OMAP boot), whatever its voltage.

Inside a vdds_dv group @1.8 V or @ 1.2 V, each vdds_dv_xxx voltage supply can be turned on any time compared with the other vdds_dv_xxx voltage supplies.

The vdda_dpll_xxx voltage supplies can be turned on at the same time as the other 1.8-V voltage supplies.

The 1.8-V and 3.3-V PHY voltage supplies can be turned on at the same time as the other 1.8-V voltage supplies or only when the corresponding applications are needed.

Once vdda_ldo_emu_wkup is turned on, vdd_core can be turned on. Once vdd_core is turned on, vdd_mpu and vdd_iva_audio can be turned on.

If the SDMMC1 functional signals are used at 1.8 V / 3.0 V, the vdds_1p8v, vdds_sdmmc1 voltage supplies can be turned on any time after vdd_core ramp-up or only when the applications are needed.

sys_32k can be turned on any time between vdds_1p8v ramp-up and sys_nrespwron release.

Once the sys_nrespwron is released, OMAP4470 activates the freq_clk_io_req signal. Therefore, the freq_slicer_in or freq_xtal_in clock can be turned on. (Nevertheless, the system can turn on the freq_slicer_in or freq_xtal_in clock before the freq_clk_io_req activation provided the vdds_1p8v supply is on.)

5 ms after the sys_nrespwron release, the clock is considered as stabilized on the OMAP4470 slicer input or crystal input. The clock may be supplied later provided it is perfectly stabilized when supplied.

1.2 ms (about 40 additional 32-kHz clock cycles) after the clock is considered as stabilized, OMAP4470 releases its sys_nreswarm.

2 ms after the clock is considered as stabilized, OMAP4470 activates the sys_pwron_reset_out signal.

3.5.2 Power-Down Sequence

The following steps give two examples of power-down sequence supported by the OMAP4470 device.

1. Put the OMAP4470 device under reset (sys_nrespwron)
2. Stop all signals driven to its balls (sys_32k, freq_slicer_in or freq_xtal_in)
3. Either:
 - (a) Shutdown all power domains at once. This sequence is described in black color in [Figure 3-9](#).
 - (b) Or, if the shutdown is sequenced, you must follow these steps (described in dashed blue color in [Figure 3-9](#)):
 - (i) Turn off all PHY power supplies and SDMMC1 IO power supplies
 - (ii) Turn off the IVA and AUDIO domains power supplies
 - (iii) Turn off the MPU domain power supply
 - (iv) Turn off the CORE domain power supply and all DLL power supplies
 - (v) Turn off all DPLL power supplies
 - (vi) Turn off all 1.2-V IO power supplies
 - (vii) Turn off all 1.8-V IO power supplies

Figure 3-9 shows both power-down sequences: one of them is described in black color, and the other one in dashed blue color.

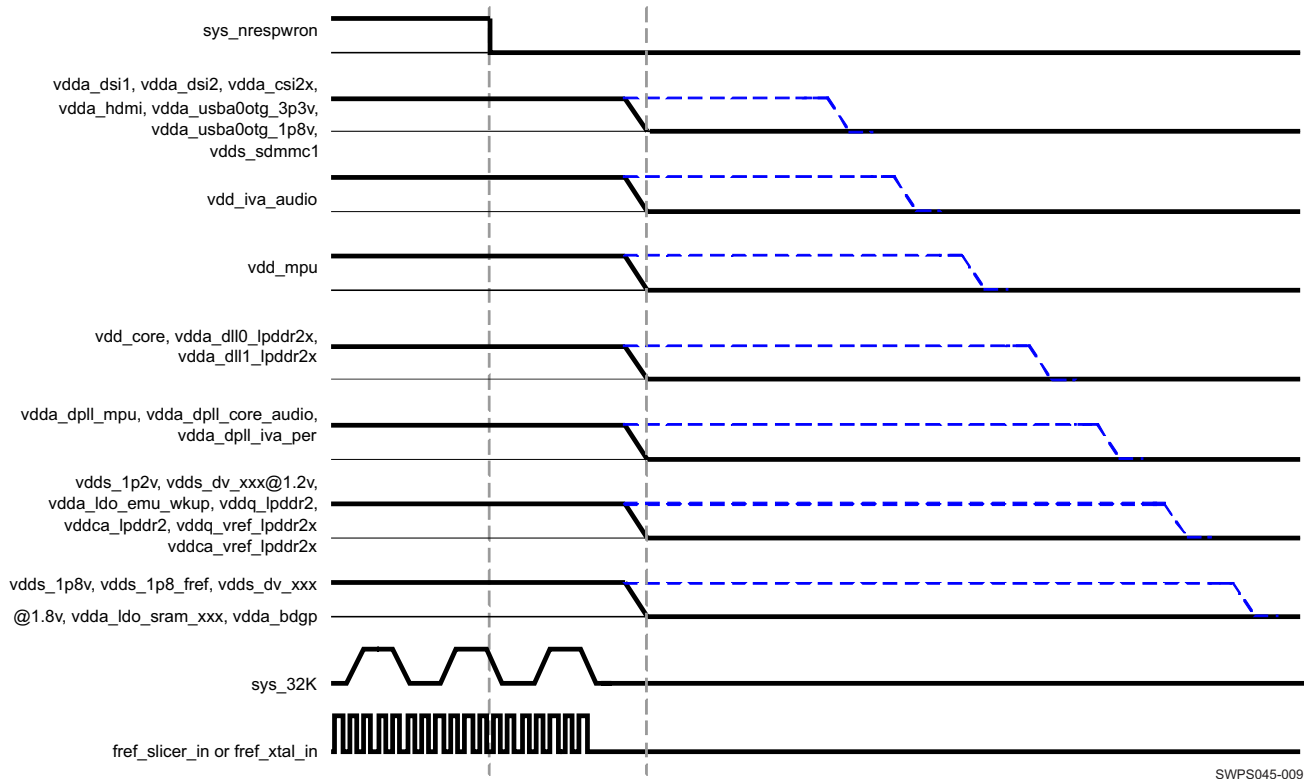

Figure 3-9. Power-Down Sequence

NOTE

sys_32k can be turned off any time between sys_nrespwron assertion and vdds_1p8v shutdown.

fref_slicer_in or fref_xtal_in can be turned off any time between sys_nrespwron assertion and vdds_1p8v shutdown.

3.5.3 Power-Off Sequence

The following steps give two examples of power-off sequence supported by the OMAP4470 device.

1. Stop all signals driven to its balls (sys_32k, fref_slicer_in or fref_xtal_in)
2. Either:
 - (a) Shutdown all voltage supplies at once. This sequence is described in black color in Figure 3-10.
 - (b) Or, if the shutdown is sequenced, the steps in dashed blue color must be followed (described in dashed blue color in Figure 3-10).

Figure 3-10 shows both power-off sequences: one of them is described in black color, and the other one in dashed blue color.

SWPS045-001

Figure 3-10. Power-Off Sequence

- (1) In case the USB HS PHY interface is used as wake-up event to exit the OMAP4 device from Off mode, the vdda_usba0_xxx voltage supplies are kept on. Else these voltage supplies can be turned off before the power-off sequence.
- (2) In case vdd_iva_audio, vdd_mpu and vdd_core are turned off at same time, the vdd_core voltage must always be higher than the vdd_iva_audio and vdd_mpu voltages (the decoupling capacitors discharging must be taken into account).
- (3) It's not mandatory to shut off vdds_1p8_fref, vdda_ldo_sram_xxx, vdda_bdgp and vdda_dppll_xxx supplies.

4 Clock Specifications

NOTE

For more information, see Power Reset and Clock Management / PRCM Environment / External Clock Signal and Power Reset / PRCM Functional Description / PRCM Clock Manager Functional Description section of the OMAP4470 TRM.

The OMAP4470 device operation requires the following input clocks: 32-kHz clock (sys_32k) and either slicer clock (fref_slicer_in) or crystal clock (fref_xtal_in / fref_xtal_out). fref_slicer_in and fref_xtal_in / fref_xtal_out at the same time is not a possible configuration. Here is the description of the three input clocks:

- The sys_32k input clock (32-kHz) is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode (off mode) and the clock source for the DPLL audio back-end DPLL.
- The fref_xtal_in input clock (12, 16.8, 19.2, 26, or 38.4 MHz) is used as a system input clock to generate the source clock of the OMAP4470 device. It supplies the DPLLs as well as several OMAP modules. The system input clock can be connected to either:
 - A crystal oscillator clock (12-MHz, 16.8-MHz, 19.2-MHz) managed by fref_xtal_in and fref_xtal_out. In this case, the fref_clk_ioreq is used as an input (GPIN).
 - A CMOS digital clock through the fref_xtal_in pin. In this case, the fref_clk_ioreq is used as an output to request the external system clock.
 - In these two cases, the fref_slicer_in input can be used to provide the OMAP4470 device with an alternate input clock up to 38.4 MHz.
- The fref_slicer_in input clock (12-MHz, 16.8-MHz, 19.2-MHz, 26-MHz, and 38.4-MHz) is also used as a system input clock to generate the source clock of the OMAP4470 device. It supplies the DPLLs as well as several OMAP4470 modules. The system input clock can be connected to either:
 - A single-ended sine clock, through the fref_slicer_in pin, which is converted by the internal slicer to a digital square clock. In this case, the fref_clk_ioreq is used an output to request the external system clock.
 - A CMOS digital clock through the fref_slicer_in pin. In this case, the fref_clk_ioreq is used as an output to request the external system clock.
 - In these two cases, the fref_xtal_in input can be used to provide the OMAP4470 device with an alternate input clock up to 100 MHz.

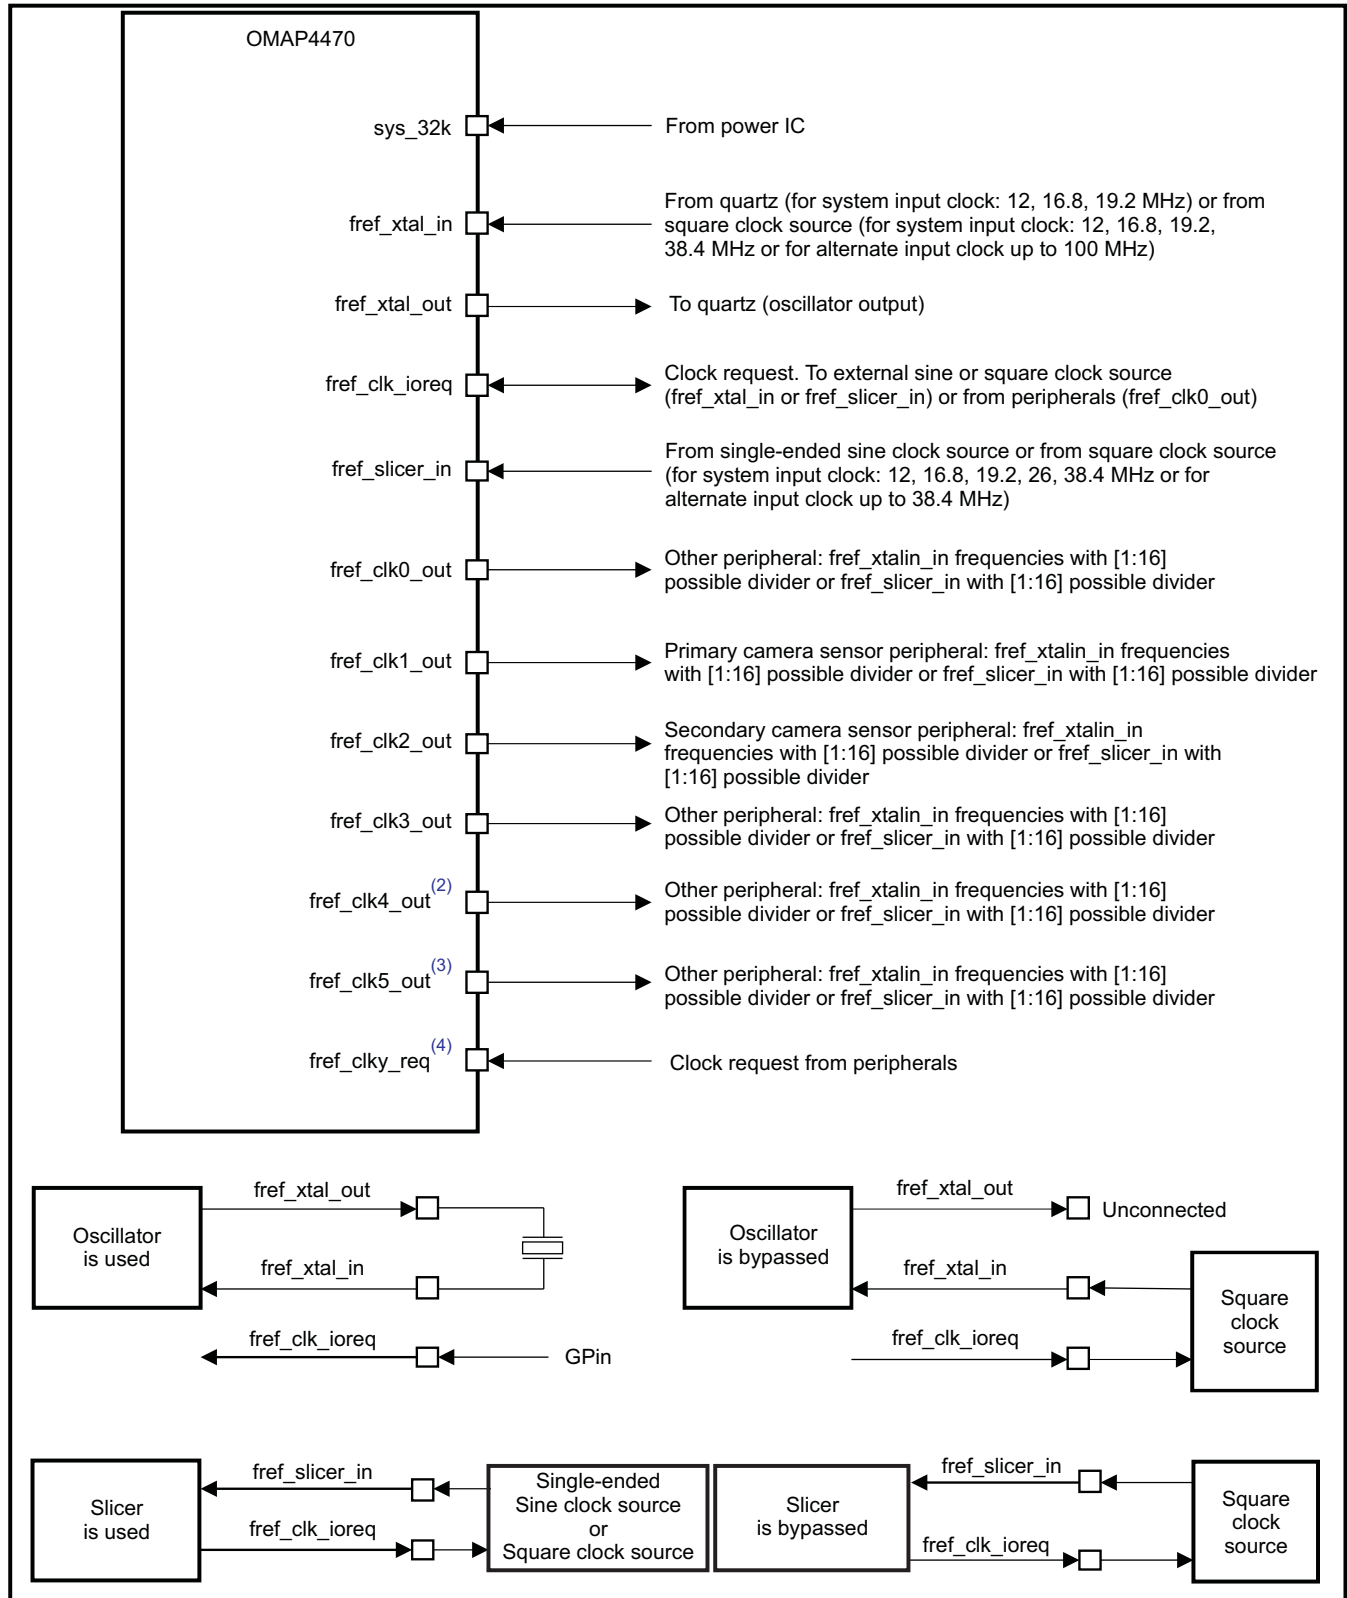

The OMAP4470 outputs externally six clocks:

- fref_clk1_out is specially targeted for the primary camera sensor functional input clock.
- fref_clk2_out is for the secondary camera sensor functional input clock.
- fref_clk0_out, fref_clk3_out, fref_clk4_out, and fref_clk5_out are also available to supply input clocks for the other peripherals.

Each output clock source can be selected independently between the system clock (fref_xtal_in, fref_slicer_in), PER DPLL, or CORE DPLL, with a programmable divider factor.

After the reset sequence, fref_clk4_out output clock is activated by default whatever the request level from fref_clk4_req signal. fref_clk5_out output clock is active only if fref_clk4_out output clock is deactivated (no request from fref_clk4_req signal). fref_clk1_out and fref_clk2_out output clocks are not always-on clocks.

Figure 4-1 shows the external input clock sources and the output clocks to peripherals.

SWPS045-003

Figure 4-1. Clock Interface⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

(1) After the reset sequence, fref_clk4_out output clock is activated by default whatever the request level from fref_clk4_req signal.

- (2) fref_clk5_out output clock is active only if fref_clk4_out output clock is deactivated (no request from fref_clk4_req signal). fref_clk4_out on by default at system boot.
- (3) fref_clk1_out and fref_clk2_out output clocks are not Always-On clocks.
- (4) In fref_clkx_req, y = [4;0]. fref_clk[1:5]_req: fref_clkx_req is clock request associated by default to fref_clkx_out. Can be associated to any fref_clk[1:5]_out by software.
- (5) When an oscillator is used, fref_clk_ioreq is associated by default to fref_clk0_out.

4.1 Input Clock Specifications

4.1.1 Input Clock Requirements

Table 4-1 illustrates the requirements to supply an input clock to the device.

Table 4-1. Input Clock Requirements⁽⁴⁾

PAD	CLOCK FREQUENCY		STABILITY	DUTY CYCLE	JITTER	TRANSITION	
sys_32k	32.768-kHz		± 200 ppm	See ⁽⁵⁾	See ⁽⁵⁾	< 30 ns	
fref_xtal_in fref_xtal_out	12-, 16.8-, or 19.2-MHz	Crystal Clock	± 50 (±5) ppm ⁽³⁾	NA	NA	NA	
	12-, 16.8-, 19.2-, 26-, or 38.4-MHz	Square Clock	± 50 (±5) ppm ⁽³⁾	45% to 55%	1% * t _{C(XTALIN)} ⁽²⁾ (ps) * Xdiv ⁽¹⁾ – 210 (ps)	< 5 ns	
fref_slicer_in fref_clk0_out	12-, 16.8-, 19.2-, 26-, or 38.4-MHz	Active mode	Single-ended Sine clock	± 50 (±5) ppm ⁽³⁾	38.5% to 61.5%	1% * t _{C(SLICER)} ⁽²⁾ (ps) * Xdiv ⁽¹⁾ – 200 ps	NA
			Square Clock	± 50 (±5) ppm ⁽³⁾	45% to 55%	1% * t _{C(SLICER)} ⁽²⁾ (ps) * Xdiv ⁽¹⁾ – 200 (ps)	< 10 ns
		Bypass Mode	Square Clock	± 50 (±5) ppm ⁽³⁾	47% to 53%	1% * t _{C(SLICER)} ⁽²⁾ (ps) * Xdiv ⁽¹⁾ – 250 (ps)	< 10 ns

- (1) In Xdiv, Xdiv represents the internal DSS DPLLs dividers. [t_{C(XTALIN)} (ps) * Xdiv] or [t_{C(SLICER)} (ps) * Xdiv] represents the input clock cycle coming to the DSS DPLLs (that means after dividing). For the other internal DPLLs, the Xdiv value is equal to 1. This input jitter limitation comes from the DPLL constraint being shifted at ball level. To clarify this formula, please consider a maximum jitter of 1% of the clock period coming to the internal DPLL (input DPLL). For more information, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / PRM Clock Source section of the OMAP4470 TRM.
- (2) t_{C(SLICER)} is the fref_slicer_in cycle time of the clock coming to fref_slicer_in ball.
t_{C(XTALIN)} is the fref_xtal_in cycle time of the clock coming to fref_xtal_in ball.
- (3) ±50 ppm is the clock frequency stability/accuracy and ±5 ppm takes into account the aging effects.
- (4) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.
- (5) sys_32k is a slow clock; this means with no stringent duty cycle and jitter requirements. Otherwise, based on the DPLL requirements, you can consider a maximum input duty cycle of [40% to 60%] of the clock period and a maximum jitter at DPLL input of 1% of the clock period coming to the DPLL.

4.1.2 sys_32k CMOS Input Clock

Table 4-2 summarizes the electrical characteristics of the sys_32k input clock.

Table 4-2. sys_32k Input Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_32k		32.768		kHz
C _i	Input capacitance			1.3	pF
R _i	Input resistance	3		10	GΩ

Table 4-3 details the input requirements of the sys_32k input clock.

Table 4-3. sys_32k Input Clock Timing Requirements⁽¹⁾⁽²⁾

NAME		DESCRIPTION	MIN	TYP	MAX	UNIT
CK0	$1 / t_{c(32k)}$	Frequency, sys_32k	32.768			kHz
	$t_{R(32k)}$	Rise time, sys_32k			30	ns
	$t_{F(32k)}$	Fall time, sys_32k			30	ns
	$t_{j(32k)}$	Frequency stability, sys_32k			200	ppm

(1) See Table 3-19, System DC Electrical Characteristics, SYS (clk32k ...) part for sys_32k V_{IH}/V_{IL} parameters.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

Figure 4-2. sys_32k Input Clock

4.1.3 fref_xtalin CMOS Input Clock

4.1.3.1 fref_xtal_in / fref_xtal_out External Crystal

An external crystal is connected to the device pins. Figure 4-3 describes the crystal implementation.

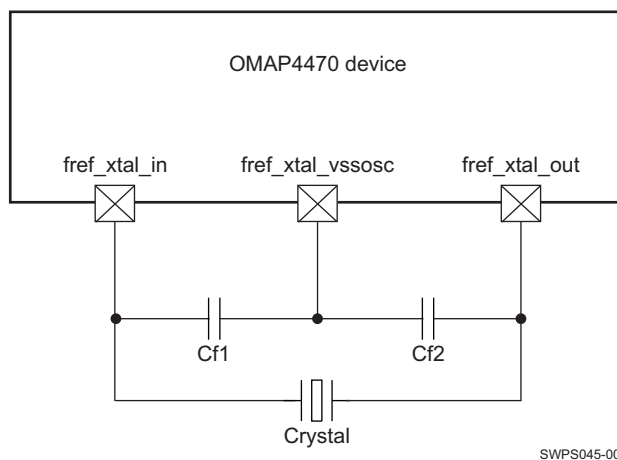

Figure 4-3. Crystal Implementation⁽¹⁾

(1) When the oscillator is bypassed, the fref_xtal_in ball is connected to a square clock source, the fref_xtal_out ball is not connected and the fref_xtal_vssosc ball is connected to the ground.

When the oscillator is not used, the fref_xtal_in and fref_xtal_out balls can be connected to the ground or not connected and the fref_xtal_vssosc ball is connected to the ground.

The crystal must be in the fundamental mode of operation and parallel resonant. Table 4-4 summarizes the required electrical constraints.

Table 4-4. Crystal Electrical Characteristics⁽²⁾

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f_p	Parallel resonance crystal frequency	12, 16.8, or 19.2			MHz
C_{f1}	C_{f1} load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$	12		24	pF
C_{f2}	C_{f2} load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$	12		24	pF

Table 4-4. Crystal Electrical Characteristics⁽²⁾ (continued)

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
ESR(C _{f1} ,C _{f2}) ⁽¹⁾	Frequency 12 MHz, Negative resistor at nominal 500 Ω, Negative resistor at worst case 300 Ω			100	Ω
	Frequency 16.8 MHz and 19.2 MHz, Negative resistor at nominal 300 Ω, Negative resistor at worst case 180 Ω			60	
C _o	Crystal shunt capacitance			4.5	pF
L _m	Crystal motional inductance for f _p = 12 MHz		16		mH
C _m	Crystal motional capacitance		10.87		fF
DL	Crystal drive level			0.5	mW

(1) Measured with the load capacitance specified by the crystal manufacturer. This load is defined by the foot capacitances tied in series. If C_L = 20 pF, then both foot capacitors will be C_{f1} = C_{f2} = 40 pF. Parasitic capacitance from package and board must also be taken in account.

(2) The crystal motional resistance R_m is related to the equivalent series resistance (ESR) by the following formula:

$$ESR = R_m * (1 + (C_o * C_{f1} * C_{f2} / (C_{f1} + C_{f2})))^2$$

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 4-5 details the switching characteristics of the oscillator and the requirements of the input clock.

Table 4-5. Oscillator Switching Characteristics—Crystal Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f _p	Oscillation frequency		12, 16.8, or 19.2		MHz
t _{sX}	Start-up time ⁽¹⁾⁽²⁾			1.2	ms

(1) Start-up time is defined as the time the oscillator takes to gain fref_xtal_in amplitude enough to have 45% to 55% duty cycle at the core input from the time power down (PWRDN) is released. Start-up time is a strong function of crystal parameters. At power-on reset, the time is adjustable using the pin itself. The reset must be released when the oscillator or clock source is stable. To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100 μs; however, if the chip comes from bypass mode to crystal mode the crystal will start-up after time mentioned in the t_{sX} parameter.

(2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a square wave. The switching time in this case is about 100 μs.

4.1.3.2 fref_xtal_in Squarer Input Clock

Table 4-6 summarizes the base oscillator electrical characteristics.

Table 4-6. Oscillator Electrical Characteristics—Bypass Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency		12, 16.8, 19.2, 26, or 38.4		MHz
C _I	Input capacitance	1.00	1.15	1.35	pF
R _I	Input resistance	160	216	280	Ω
t _{sX}	Start-up time ⁽¹⁾		See ⁽²⁾		ms

(1) To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100 μs; however, if the chip comes from bypass mode to crystal mode the crystal will start-up after time mentioned in Table 4-5, t_{sX} parameter.

(2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a square wave. The switching time in this case is about 100 μs.

Table 4-7 details the squarer input clock timing requirements.

Table 4-7. fref_xtal_in Squarer Input Clock Timing Requirements—Bypass Mode⁽³⁾

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
OCS0	1 / t _{c(xtal_in)} Frequency, fref_xtal_in		12, 16.8, 19.2, 26, or 38.4		MHz
OCS1	t _{w(xtal_in)} Pulse duration, fref_xtal_in low or high	0.45 * t _{c(XTALIN)}		0.55 * t _{c(XTALIN)}	ns

Table 4-7. fref_xtal_in Squarer Input Clock Timing Requirements—Bypass Mode⁽³⁾ (continued)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
$t_{j(\text{xtalin})}$	Peak-to-peak jitter ⁽¹⁾ , fref_xtal_in				$1\% * t_{c(\text{XTALIN})}^{(5)} \text{ (ps)} * X_{\text{div}}^{(4)} - 210 \text{ (ps)}$	ps
$t_{R(\text{xtalin})}$	Rise time, fref_xtal_in				5	ns
$t_{F(\text{xtalin})}$	Fall time, fref_xtal_in				5	ns
$t_{j(\text{xtalin})}$	Frequency stability, fref_xtal_in				50 (± 5) ⁽²⁾	ppm

(1) Peak-to-peak jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period.

(2) ± 50 ppm is the clock frequency stability/accuracy and ± 5 ppm takes into account the aging effects.

(3) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(4) In Xdiv, Xdiv represents the internal DSS DPLLs dividers. $[t_{c(\text{XTALIN})} \text{ (ps)} * X_{\text{div}}$ or $[t_{c(\text{SLICER})} \text{ (ps)} * X_{\text{div}}$ represents the input clock cycle coming to the DSS DPLLs (that means after dividing). For the other internal DPLLs, the Xdiv value is equal to 1. This input jitter limitation comes from the DPLL constraint shifted at ball level. To clarify this formula, please consider a maximum jitter of 1% of the clock period coming to the internal DPLL (input DPLL).
For more information, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / PRM Clock Source section of the OMAP4470 TRM.

(5) $t_{c(\text{XTALIN})}$ is the fref_xtal_in cycle time of the clock coming to fref_xtalin_in ball.

SWPS039-007

Figure 4-4. fref_xtal_in Squarer Input Clock

4.1.4 fref_slicer_in Input Clock

Table 4-8 summarizes the electrical characteristics of the fref_slicer_in input clock.

Table 4-8. fref_slicer_in Input Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, fref_slicer_in	12, 16.8, 19.2, 26, and 38.4			MHz
C_i	Input capacitance			2.5	pF
R_i	Input resistance	14		29	k Ω

Table 4-9 details the input requirements of the fref_slicer_in input clock.

Table 4-9. fref_slicer_in Input Square Clock Timing Requirements⁽¹⁾⁽⁶⁾

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
SLC0	$1 / t_{c(\text{fref_slicer_in})}$	Frequency, fref_slicer_in	12, 16.8, 19.2, 26, and 38.4			MHz
SLC1	$t_{w(\text{fref_slicer_in})}$	Pulse duration, fref_slicer_in low or high	Active mode Square Clock	$0.45 * t_{c(\text{SLICER})}$	$0.55 * t_{c(\text{SLICER})}$	ns
			Bypass mode Square Clock	$0.47 * t_{c(\text{SLICER})}$	$0.53 * t_{c(\text{SLICER})}$	
	$t_{j(\text{fref_slicer_in})}$	Peak-to-peak jitter ⁽²⁾ , fref_slicer_in	Active mode Square Clock		$1\% * t_{c(\text{SLICER})}^{(4)} \text{ (ps)} * X_{\text{div}}^{(3)} - 200 \text{ (ps)}$	ps
			Bypass mode Square Clock		$1\% * t_{c(\text{SLICER})}^{(4)} \text{ (ps)} * X_{\text{div}}^{(3)} - 250 \text{ (ps)}$	
	$t_{R(\text{fref_slicer_in})}$	Rise time, fref_slicer_in	1.5		10	ns

Table 4-9. fref_slicer_in Input Square Clock Timing Requirements⁽¹⁾⁽⁶⁾ (continued)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
$t_{F(fref_slicer_in)}$	Fall time, fref_slicer_in		1.5		10	ns
$t_{j(fref_slicer_in)}$	Frequency stability, fref_slicer_in				50 (± 5) ⁽⁵⁾	ppm

- (1) See Table 3-19, System DC Electrical Characteristics, SYS (fref_slicer_in) part for fref_slicer_in V_{IH}/V_{IL} parameters
- (2) Peak-to-peak jitter is meant here as follows:
 - The maximum value is the difference between the longest measured clock period and the expected clock period
 - The minimum value is the difference between the shortest measured clock period and the expected clock period
 Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period.
- (3) In Xdiv, Xdiv represents the internal DSS DPLLs dividers. $[t_{C(XTALIN)} (ps) * Xdiv]$ or $[t_{C(SLICER)} (ps) * Xdiv]$ represents the input clock cycle coming to the DSS DPLLs (that means after dividing). For the other internal DPLLs, the Xdiv value is equal to 1. This input jitter limitation comes from the DPLL constraint shifted at ball level. To clarify this formula, please consider a maximum jitter of 1% of the clock period coming to the internal DPLL (input DPLL).
For more information, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / PRM Clock Source section of the OMAP4470 TRM.
- (4) $t_{C(SLICER)}$ is the fref_slicer_in cycle time of the clock coming to fref_slicer_in ball.
- (5) ± 50 ppm is the clock frequency stability/accuracy and ± 5 ppm takes into account the aging effects.
- (6) In this table the rise and fall times are calculated for 10% to 90% of VDDS. For more information on the corresponding OMAP4 VDDS power supply name, see Table 2-1, POWER [9] column with the ball name.

Table 4-10. fref_slicer_in Input Single-ended Sine Clock Timing Requirements⁽¹⁾

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
SLC0	$1 / t_{C(fref_slicer_in)}$	Frequency, fref_slicer_in	12, 16.8, 19.2, 26, and 38.4			MHz
SLC1	$t_{w(fref_slicer_in)}$	Pulse duration, fref_slicer_in low or high	0.385 * $t_{C(SLICER)}$		0.615 * $t_{C(SLICER)}$	ns
	$t_{j(fref_slicer_in)}$	Peak-to-peak jitter ⁽²⁾ , fref_slicer_in			1% * $t_{C(SLICER)}$ ⁽⁴⁾ (ps) * $Xdiv$ ⁽³⁾ – 200 (ps)	ps
	$t_{j(fref_slicer_in)}$	Frequency stability, fref_slicer_in			50 (± 5) ⁽⁵⁾	ppm

- (1) See Table 3-4, DC Electrical Characteristics, SYS (clk_slicer_in) part for fref_slicer_in V_{IH}/V_{IL} parameters
- (2) Peak-to-peak jitter is meant here as follows:
 - The maximum value is the difference between the longest measured clock period and the expected clock period
 - The minimum value is the difference between the shortest measured clock period and the expected clock period
 Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period.
- (3) In Xdiv, Xdiv represents the internal DSS DPLLs dividers. $[t_{C(XTALIN)} (ps) * Xdiv]$ or $[t_{C(SLICER)} (ps) * Xdiv]$ represents the input clock cycle coming to the DSS DPLLs (that means after dividing). For the other internal DPLLs, the Xdiv value is equal to 1. This input jitter limitation comes from the DPLL constraint shifted at ball level. To clarify this formula, please consider a maximum jitter of 1% of the clock period coming to the internal DPLL (input DPLL).
For more information, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / PRM Clock Source section of the OMAP4470 TRM.
- (4) $t_{C(SLICER)}$ is the fref_slicer_in cycle time of the clock coming to fref_slicer_in ball.
- (5) ± 50 ppm is the clock frequency stability/accuracy and ± 5 ppm takes into account the aging effects.

SWPS039-008

Figure 4-5. fref_slicer_in Input Clock

4.2 Output Clocks Specifications

4.2.1 FREF Output Clocks

Each output clock source can be selected independently between the system clock (fref_xtal_in, fref_slicer_in), PER DPLL, or CORE DPLL, with a programmable divider factor. For more information, see the Power, Reset and Clock Management / PRCM Subsystem Environment / External Clock Signals section of the OMAP4470 TRM.

Table 4-11 summarizes the electrical characteristics of the fref_clk1_out output clock (specially targeted for the primary camera sensor functional input clock), fref_clk2_out output clock (targeted for the secondary camera sensor functional input clock), and fref_clk0_out, fref_clk3_out, fref_clk4_out, fref_clk5_out output clocks (input clocks for the other peripherals).

Table 4-11. fref_clkx_out Output Clock Electrical Characteristics⁽¹⁾⁽³⁾

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, fref_clkx_out	fref_xtal_in clock frequency ⁽²⁾ or fref_slicer_in clock frequency ⁽²⁾ or PER/CORE DPLL frequency ⁽²⁾			MHz
MB[1:0] = 11 and MB[1:0] = 01 (Default setting: MB[1:0] = 01 and LB0 = 0)					
LB0 = 1					
C _L	Load capacitance (Transmission line load + Far end load)	20		25	pF
Z _T	Transmission line impedance	30		60	Ω

Table 4-12. fref_clkx_out Output Clock Switching Characteristics⁽¹⁾⁽⁶⁾⁽⁷⁾⁽⁹⁾ (continued)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
$t_{R(\text{clkOUT1})}$	Rise time, fref_clkx_out		2.2 ⁽³⁾⁽⁵⁾		14.3 ⁽⁴⁾	ns
$t_{F(\text{clkOUT1})}$	Fall time, fref_clkx_out		2.2 ⁽³⁾⁽⁵⁾		14.3 ⁽⁴⁾	ns
LB0 = 0						
$t_{R(\text{clkOUT1})}$	Rise time, fref_clkx_out		0.7 ⁽³⁾⁽⁵⁾		10.4 ⁽⁴⁾	ns
$t_{F(\text{clkOUT1})}$	Fall time, fref_clkx_out		0.7 ⁽³⁾⁽⁵⁾		10.4 ⁽⁴⁾	ns

(1) In fref_clkx_out, x = 0, 1, 2, 3, 4, or 5

(2) A divide factor from 1 to 16 can be applied on this clock frequency.
For more information, see the SCRM.AUXCLK[0:5] register, CLKDIV bitfield in the OMAP4470 TRM.

(3) At minimum load

(4) At maximum load (maximum frequency: 104 MHz)

(5) **Caution:** this creates EMI parasitics up to 1.2 ns.

(6) In this table the rise and fall times are calculated for 10% to 90% of VDDS.
For more information on the corresponding OMAP4 VDDS power supply name, see Table 2-1, POWER [9] column with the ball name.

(7) clkx_out is the external clock signal at the fref_clkx_out output pin.
dpll_out is the internal clock signal at the dpll output, before the clock divider controlled by CLKDIV.

(8) ± 50 ppm is the clock frequency stability/accuracy and ± 5 ppm takes into account the aging effects.

(9) $t_{J(\text{fref_xtal_in})}$ or $t_{J(\text{fref_slicer_in})}$ corresponds to the external jitter coming to the fref_xtal_in or fref_slicer_in input PAD.

**Figure 4-6. fref_clkx_out Output Clocks⁽¹⁾**

(1) In fref_clkx_out, x = 0, 1, 2, 3, 4, or 5

4.3 DPLLs, DLLs Specifications

NOTE

For more information, see:

- Power, Reset and Clock Management / Clock Management Functional / Internal Clock Sources/Generators / Generic DPLL Overview section and
- Display Subsystem / Display Subsystem Overview section of the OMAP4470 ES2.x TRM.

The applicative subsystem integrates nine DPLLs and four DLLs. The PRM and CM drive six of them, while the display subsystem controls three other DPLLs (DSI1_1 DPLL, DSI1_2 DPLL, and HDMI DPLL).

The six main DPLLs are:

- DPLL1 (MPU)
- DPLL2 (IVA)
- DPLL3 (CORE)
- DPLL4 (PER)
- DPLL5 (ABE)
- DPLL6 (USB)

NOTE

Of the nine DPLLs embedded in the OMAP4470 device, the DSI1_1 DPLL, DSI1_2 DPLL, and HDMI DPLL are controlled directly by the display subsystem.

4.3.1 DPLLs Characteristics

Table 4-13 and Table 4-14 summarize the DPLL characteristics and assume testing over recommended operating conditions.

Table 4-13. DPLL1 / DPLL2 / DPLL3 / DPLL4 / DPLL5 / DSI1_1 DPLL / DSI1_2 DPLL Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
vdda_dppll_iva_per	Supply voltage for DPLLs (IVA and PER)	1.71	1.80	1.89	V	
vdda_dppll_mpu	Supply voltage for DPLL MPU	1.71	1.80	1.89	V	
vdda_dppll_core_audio	Supply voltage for DPLLs (CORE and AUDIO)	1.71	1.80	1.89	V	
vdda_dsi1	Supply voltage for DSI1_1 DPLL	1.71	1.80	1.89	V	
vdda_dsi2	Supply voltage for DSI1_2 DPLL	1.71	1.80	1.89	V	
f _{input}	CLKINP input frequency	0.032		52	MHz	FINP
f _{REF}	Internal reference clock frequency	0.032		52	MHz	REFCLK
f _{CLKINPHIF}	CLKINPHIF input frequency	10		1000	MHz	FINPHIF
f _{CLKINPULOW}	CLKINPULOW input frequency	0.001		800	MHz	
f _{CLKOUT}	CLKOUT output frequency	10 ⁽¹⁾		1000 ⁽²⁾	MHz	$[M / (N + 1)] * FINP * [1 / M2]$
f _{CLKOUTx2}	CLKOUTx2 output frequency	20 ⁽¹⁾		2000 ⁽²⁾	MHz	$2 * [M / (N + 1)] * FINP * [1 / M2]$
f _{CLKOUTHIF}	CLKOUTHIF output frequency	10 ⁽³⁾		1000 ⁽⁴⁾	MHz	FINPHIF / M3
		20 ⁽³⁾		2000 ⁽⁴⁾		$2 * [M / (N + 1)] * FINP * [1 / M3]$
f _{CLKDCOLDO}	Digital-Controlled Oscillator (DCO) output clock frequency	20		2000	MHz	$2 * [M / (N + 1)] * FINP$
	CLKOUT period jitter	-2.5%		2.5%		The period jitter at the output clocks is ±2.5% peak to peak for REFCLK above or equal to 1 MHz. If REFCLK < 1 MHz, the output jitter is up to ±3%.
	CLKOUTx2 period jitter	-2.5%		2.5%		
	CLKOUTHIF period jitter	-2.5%		2.5%		
	CLKDCOLDO period jitter	-2.5%		2.5%		
t _{lock}	Frequency lock time			1.9 + 350 * REFCLK	µs	
p _{lock}	Phase lock time			1.9 + 500 * REFCLK	µs	
t _{relock-L}	Relock time—Frequency lock ⁽⁵⁾ (Low power bypass)			1.9 + 70 * REFCLK	µs	DPLL in low-power mode: lowcurrstdby = 1
p _{relock-L}	Relock time—Phase lock ⁽⁵⁾ (Low power bypass)			1.9 + 120 * REFCLK	µs	DPLL in low-power mode: lowcurrstdby = 1
t _{relock-F}	Relock time—Frequency lock ⁽⁵⁾ (Fast relock bypass)			0.05 + 70 * REFCLK	µs	DPLL in normal mode: lowcurrstdby = 0
p _{relock-F}	Relock time—Phase lock ⁽⁵⁾ (Fast relock bypass)			0.05 + 120 * REFCLK	µs	DPLL in normal mode: lowcurrstdby = 0

(1) The minimum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

For M2 > 1, the minimum frequency on these clocks will further scale down by factor of M2.

(2) The maximum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

(3) The minimum frequency on CLKOUTHIF is assuming M3 = 1. For M3 > 1, the minimum frequency on this clock will further scale down by factor of M3.

(4) The maximum frequency on CLKOUTHIF is assuming M3 = 1.

(5) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

Table 4-14. DPLL6/HDMI DPLL Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
vdda_usba0otg_1p8v	Supply voltage for USB DPLL	1.71	1.80	1.89	V	
vdda_hdmi	Supply voltage for HDMI DPLL	1.71	1.80	1.89	V	
f _{input}	Input clock frequency	0.5		60	MHz	FINP
f _{REF}	Internal reference clock frequency	0.5		2.5	MHz	REFCLK = [1 / (N + 1)] * FINP
f _{CLKINPULOW}	CLKINPULOW bypass input clock frequency	0.001		800	MHz	Bypass mode (supported by DPLL6): f _{CLKOUT} = f _{CLKINPULOW}
f _{CLKOUTLDO}	CLKOUTLDO output clock frequency	500 ⁽¹⁾		2000 ⁽²⁾	MHz	[M / (N + 1)] * FINP * [1 / M2]
f _{CLKOUT}	CLKOUT output clock frequency	500 ⁽¹⁾		2000 ⁽²⁾	MHz	[M / (N + 1)] * FINP * [1 / M2]
f _{CLKDCOLDO}	Digital-controlled oscillator (DCO) output clock frequency	500		2000	MHz	[M / (N + 1)] * FINP
	CLKOUT period jitter	–2.5%		2.5%		The period jitter at the output clocks is ±2.5% peak to peak
	CLKDCOLDO period jitter	–2.5%		2.5%		
t _{lock}	Frequency lock time			350 * REFCLKs	μs	
p _{lock}	Phase lock time			500 * REFCLKs	μs	
t _{relock-L}	Relock time—Frequency lock ⁽³⁾ (Low power bypass)			7.5 + 30 * REFCLKs	μs	
p _{relock-L}	Relock time—Phase lock ⁽³⁾ (Low power bypass)			7.5 + 125 * REFCLKs	μs	

(1) The minimum frequency on this clock is assuming M2 = 1.

For M2 > 1, the minimum frequency on this clock will further scale down to 10 MHz by factor of M2.

(2) The maximum frequency on this clock is assuming M2 = 1.

(3) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

4.3.2 DLLs Characteristics

Table 4-15 summarizes the DLL characteristics and assumes testing over recommended operating conditions.

Table 4-15. DLL Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
vdda_dli0_lpddr21	LPDDR21 power supply providing clocks to bytes 0 and 2		See (2)		V
vdda_dli1_lpddr21	LPDDR21 power supply providing clocks to bytes 1 and 3		See (2)		V
vdda_dli0_lpddr22	LPDDR22 power supply providing clocks to bytes 0 and 2		See (2)		V
vdda_dli1_lpddr22	LPDDR22 power supply providing clocks to bytes 1 and 3		See (2)		V
f_{input}	Input clock frequency ⁽¹⁾	48		466	MHz
t_{lock}	Lock time			400	cycles
t_{relock}	Relock time (a change of the DLL frequency implies that DLL must relock)			400	cycles

(1) Maximum frequency for minimal conditions

(2) The DLL power supplies (vdda_dli0_lpddr21, vdda_dli0_lpddr22, vdda_dli1_lpddr21, vdda_dli1_lpddr22) voltage ranges follow the vdd_core voltage ones. They can be shorted with vdd_core. See the operating condition addendum for values.

4.3.3 DPLLs and DLLs Noise Isolation

NOTE

For more information on DPLLs and DLLs decoupling capacitors requirements, see [Section 3.4.1.3, Analog Voltage Decoupling](#).

4.4 Internal 32-kHz Oscillator

An internal 32-kHz oscillator is implemented in the wake-up domain. Table 4-16 gives the internal 32-kHz oscillator characteristic.

Table 4-16. Internal 32-kHz Oscillator Characteristic

PARAMETER	MIN	TYP	MAX	UNIT
Internal 32-kHz oscillator frequency	16	32	60	kHz

5 Timing Requirements and Switching Characteristics

5.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

5.2 Interface Clock Specifications

5.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

5.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the device IC and doesn't take into account any system consideration (PCB, Peripherals).

The system designer will have to consider these system considerations and the device IC timing characteristics as well to define properly the maximum operating frequency that corresponds to the maximum frequency supported to transfer the data on this interface.

5.2.3 Clock Jitter Specifications

Jitter is a phase noise, which may alter different characteristics of a clock signal. The jitter specified in this document is the time difference between the typical cycle period and the actual cycle period affected by noise sources on the clock. The cycle (or period) jitter terminology will be used to identify this type of jitter.

Figure 5-1. Cycle (or Period) Jitter

Jitter values are defined as follows:

- Ideal clock period = t_p
- Maximum Cycle/Period Jitter = $\text{Max} (|t_i - t_p|)$, with $i = n - 1, n, n + 1, \dots$
- Minimum Cycle/Period Jitter = $\text{Min} (|t_i - t_p|)$
- Jitter Standard Deviation (or RMS Jitter) = Standard Deviation ($|t_i - t_p|$)

Unless otherwise specified, the jitter probability density can be approximated by a Gaussian function and peak-to-peak jitter is defined over a ± 7 sigma distribution of this function.

5.2.4 Clock Duty Cycle Error

The maximum duty cycle error is the difference between the absolute value of the maximum high-level pulse duration or the maximum low-level pulse duration and the typical pulse duration value:

- maximum pulse duration = typical pulse duration + maximum duty cycle error
- minimum pulse duration = typical pulse duration – maximum duty cycle error

In this document, the clock duty cycle can be documented as maximum pulse duration or as maximum duty cycle error. In this case, you can consider:

maximum duty cycle error = maximum [(maximum pulse duration – typical pulse duration) or (typical pulse duration – minimum pulse duration)]

5.3 Timing Parameters

The timing parameter symbols used in the timing requirements and switching characteristics tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

Table 5-1. Timing Parameters

SUBSCRIPTS	
Symbol	Parameter
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

5.4 External Memory Interface

The OMAP4470 includes the following external memory interfaces:

- General-purpose memory controller (GPMC)
- External memory interface controller (EMIF)

5.4.1 General-Purpose Memory Controller (GPMC)

NOTE

For more information, see the General-Purpose Memory Controller Overview section of the OMAP4470 TRM.

The GPMC is the OMAP-unified memory controller that interfaces external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

5.4.1.1 GPMC/NOR Flash Interface—Synchronous Mode—58.25 MHz

Table 5-3 and Table 5-4 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-2 through Figure 5-5).

Table 5-2. GPMC/NOR Flash Timing Conditions—Synchronous Mode—58.25 MHz⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1.38	2.79	ns
t_F	Input signal fall time	1.14	2.85	ns
PCB Condition				
	Number of external peripherals		4	
C_{LOAD}	Far-end load		15	pF
	Trace length		5	cm
	Characteristic impedance	40	55	Ω

(1) IO settings except gpmc_nwp: LB0 = 1. For more information, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / C2C I/O cells with load setting adjustable according to interface requirement / voltage mode section of the OMAP4470 TRM. IO settings for gpmc_nwp: MB[1:0] = 01 and LB0 = 0. For more information, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) \times trace length (cm).

Table 5-3. GPMC/NOR Flash Timing Requirements—Synchronous Mode—58.25 MHz⁽²⁾

NO.	PARAMETER		OPP119, OPP100, OPP50		UNIT
			MIN	MAX	
F12	$t_{su(dV-clkH)}$	Setup time, input data gpmc_ad[15:0] valid before output clock gpmc_clk high	3.0		ns
F13	$t_{h(clkH-dV)}$	Hold time, input data gpmc_ad[15:0] valid after output clock gpmc_clk high	2.4		ns
F21	$t_{su(waitV-clkH)}$	Setup time, input wait gpmc_waitx ⁽¹⁾ valid before output clock gpmc_clk high	3.0		ns
F22	$t_{h(clkH-waitV)}$	Hold time, input wait gpmc_waitx ⁽¹⁾ valid after output clock gpmc_clk high	2.4		ns

- (1) In gpmc_waitx, x is equal to 0, 1, 2, or 3.
 (2) See DM Operating Condition Addendum for OPP voltages.

Table 5-4. GPMC/NOR Flash Switching Characteristics—Synchronous Mode—58.25 MHz

NO.	PARAMETER		OPP119, OPP100, OPP50		UNIT
			MIN	MAX

- (1) For single read: $A = (CSRdOffTime - CSOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$ period
 For burst read: $A = (CSRdOffTime - CSOnTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$ period with n the page burst access number.
 For burst write: $A = (CSWOffTime - CSOnTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$ period with n the page burst access number.

(2) $B = ClkActivationTime * GPMC_FCLK$

- (3) For single read: $C = RdCycleTime * (TimeParaGranularity + 1) * GPMC_FCLK$
 For burst read: $C = (RdCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$ with n the page burst access number.
 For burst write: $C = (WrCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$ with n the page burst access number.

- (4) For single read: $D = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
 For burst read: $D = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

- For burst write: $D = (WrCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
- (5) For single read: $E = (CSRdOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
 For burst read: $E = (CSRdOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
 For burst write: $E = (CSWrOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
- (6) For nCS falling edge (CS activated):
 Case GpmcFCLKDivider = 0:
 – $F = 0.5 * CSEExtraDelay * GPMC_FCLK$
- Case GpmcFCLKDivider = 1:
 – $F = 0.5 * CSEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and CSOnTime are odd) or (ClkActivationTime and CSOnTime are even)
 – $F = (1 + 0.5 * CSEExtraDelay) * GPMC_FCLK$, otherwise
- Case GpmcFCLKDivider = 2:
 – $F = 0.5 * CSEExtraDelay * GPMC_FCLK$ if ((CSOnTime – ClkActivationTime) is a multiple of 3)
 – $F = (1 + 0.5 * CSEExtraDelay) * GPMC_FCLK$ if ((CSOnTime – ClkActivationTime – 1) is a multiple of 3)
 – $F = (2 + 0.5 * CSEExtraDelay) * GPMC_FCLK$ if ((CSOnTime – ClkActivationTime – 2) is a multiple of 3)
- (7) For ADV falling edge (ADV activated):
 Case GpmcFCLKDivider = 0:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$
- Case GpmcFCLKDivider = 1:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if (ClkActivationTime and ADVOnTime are odd) or (ClkActivationTime and ADVOnTime are even)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$, otherwise
- Case GpmcFCLKDivider = 2:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if ((ADVOnTime – ClkActivationTime) is a multiple of 3)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVOnTime – ClkActivationTime – 1) is a multiple of 3)
 – $G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVOnTime – ClkActivationTime – 2) is a multiple of 3)
- For ADV rising edge (ADV deactivated) in reading mode:
 Case GpmcFCLKDivider = 0:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$
- Case GpmcFCLKDivider = 1:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if (ClkActivationTime and ADVRdOffTime are odd) or (ClkActivationTime and ADVRdOffTime are even)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$, otherwise
- Case GpmcFCLKDivider = 2:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if ((ADVRdOffTime – ClkActivationTime) is a multiple of 3)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVRdOffTime – ClkActivationTime – 1) is a multiple of 3)
 – $G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVRdOffTime – ClkActivationTime – 2) is a multiple of 3)
- For ADV rising edge (ADV deactivated) in writing mode:
 Case GpmcFCLKDivider = 0:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$
- Case GpmcFCLKDivider = 1:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if (ClkActivationTime and ADVWrOffTime are odd) or (ClkActivationTime and ADVWrOffTime are even)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$, otherwise
- Case GpmcFCLKDivider = 2:
 – $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime) is a multiple of 3)
 – $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime – 1) is a multiple of 3)
 – $G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime – 2) is a multiple of 3)
- (8) For OE falling edge (OE activated) / IO DIR rising edge (IN direction):
 Case GpmcFCLKDivider = 0:
 – $H = 0.5 * OEEExtraDelay * GPMC_FCLK$
- Case GpmcFCLKDivider = 1:
 – $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and OEOnTime are odd) or (ClkActivationTime and OEOnTime are even)
 – $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$, otherwise
- Case GpmcFCLKDivider = 2:
 – $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime) is a multiple of 3)
 – $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime – 1) is a multiple of 3)

- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if $((OEOnTime - ClkActivationTime - 2)$ is a multiple of 3)

For OE rising edge (OE deactivated):

Case GpmcFCLKDivider = 0:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if $(ClkActivationTime$ and $OEOffTime$ are odd) or $(ClkActivationTime$ and $OEOffTime$ are even)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$, otherwise

Case GpmcFCLKDivider = 2:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if $((OEOffTime - ClkActivationTime)$ is a multiple of 3)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if $((OEOffTime - ClkActivationTime - 1)$ is a multiple of 3)
- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if $((OEOffTime - ClkActivationTime - 2)$ is a multiple of 3)

- (9) For WE falling edge (WE activated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if $(ClkActivationTime$ and $WEOnTime$ are odd) or $(ClkActivationTime$ and $WEOnTime$ are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$, otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if $((WEOnTime - ClkActivationTime)$ is a multiple of 3)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if $((WEOnTime - ClkActivationTime - 1)$ is a multiple of 3)
- $I = (2 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if $((WEOnTime - ClkActivationTime - 2)$ is a multiple of 3)

For WE rising edge (WE deactivated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if $(ClkActivationTime$ and $WEOffTime$ are odd) or $(ClkActivationTime$ and $WEOffTime$ are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$, otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime)$ is a multiple of 3)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime - 1)$ is a multiple of 3)
- $I = (2 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime - 2)$ is a multiple of 3)

- (10) $J = GPMC_FCLK$ period

- (11) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

In gpmc_waitx, x is equal to 0, 1, 2, or 3.

- (12) $P = gpmc_clk$ period

- (13) For read: $K = (ADVRdOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

For write: $K = (ADVWrOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

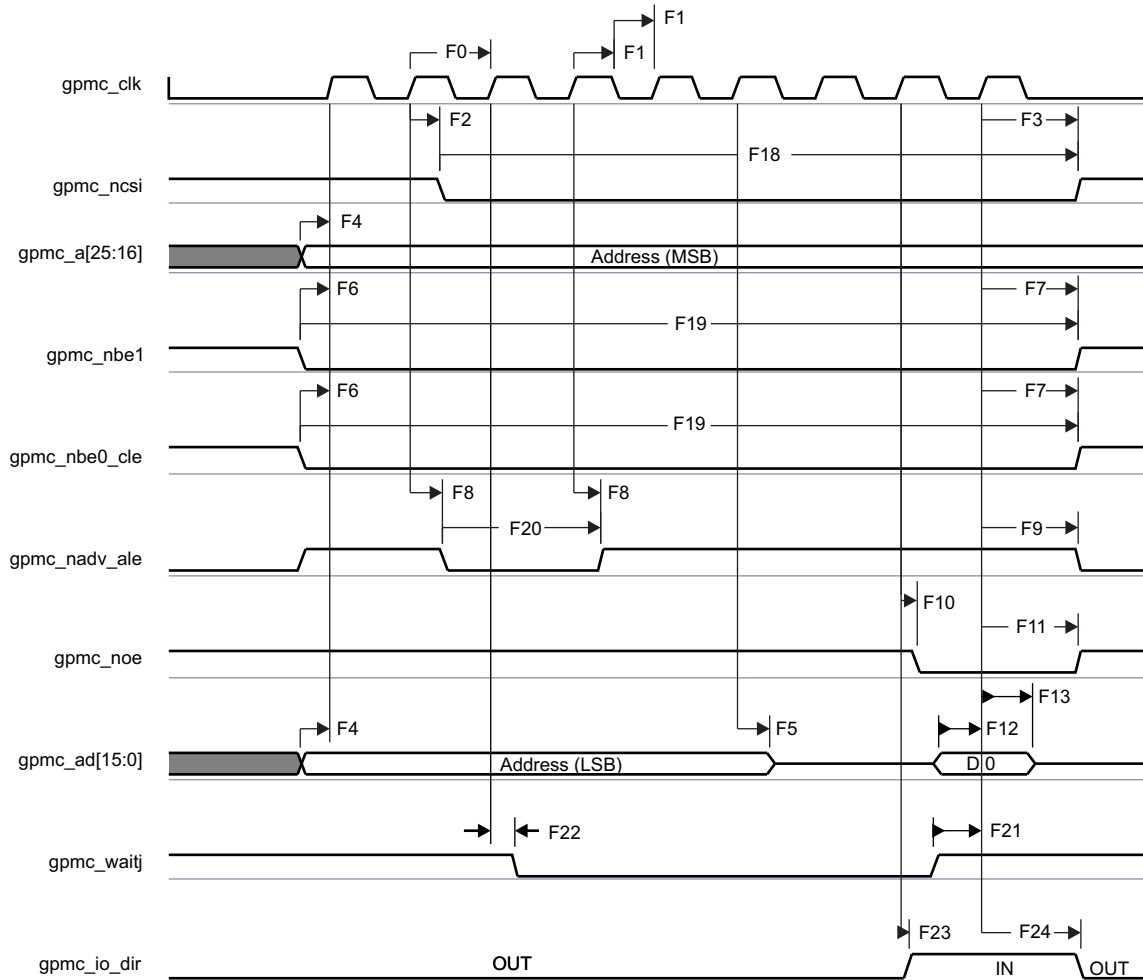

- (14) $GPMC_FCLK$ is the general-purpose memory controller internal functional clock.

- (15) Related to the gpmc_clk output clock maximum and minimum frequency programmable in the I/F module by setting the $GPMC_CONFIG1_CSx$ configuration register bit fields GpmcFCLKDivider.

- (16) The jitter probability density can be approximated by a Gaussian function.

- (17) $M = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

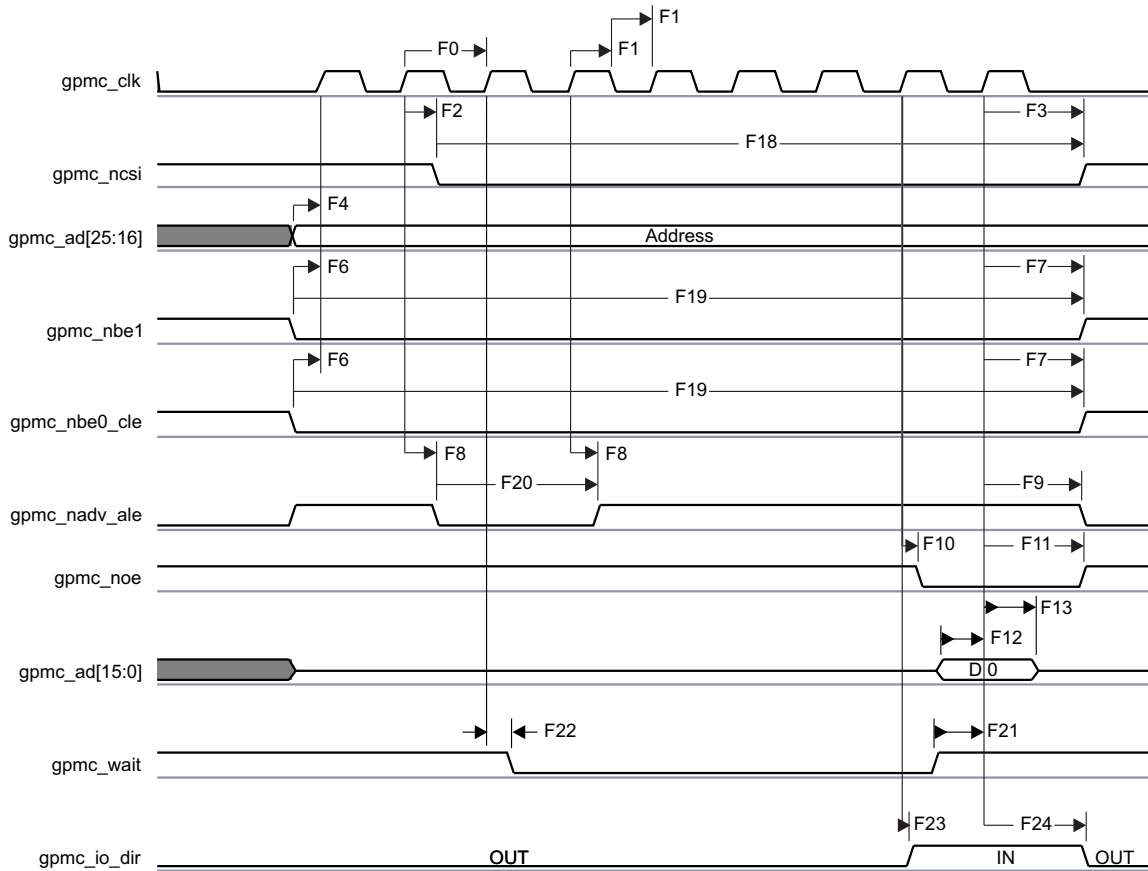

The M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both RdCycleTime and BusTurnAround completion. Behaviour of IO direction signal does depend on kind of successive read/write accesses performed to memory and multiplexed or nonmultiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behaviour is automatically handled by GPMC controller.

 For burst write: $E = (\text{CSWrOffTime} - \text{AccessTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK}$
- (6) For nCS falling edge (CS activated):
 Case GpmcFCLKDivider = 0:
 – $F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK}$
 Case GpmcFCLKDivider = 1:
 – $F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK}$ if (ClkActivationTime and CSOnTime are odd) or (ClkActivationTime and CSOnTime are even)
 – $F = (1 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK}$ otherwise
 Case GpmcFCLKDivider = 2:
 – $F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK}$ if ((CSOnTime – ClkActivationTime) is a multiple of 3)
 – $F = (1 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK}$ if ((CSOnTime – ClkActivationTime – 1) is a multiple of 3)
 – $F = (2 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK}$ if ((CSOnTime – ClkActivationTime – 2) is a multiple of 3)
- (7) For ADV falling edge (ADV activated):
 Case GpmcFCLKDivider = 0:
 – $G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$
 Case GpmcFCLKDivider = 1:
 – $G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$ if (ClkActivationTime and ADVOnTime are odd) or (ClkActivationTime and ADVOnTime are even)
 – $G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK}$ otherwise
 Case GpmcFCLKDivider = 2:
 – $G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$ if ((ADVOnTime – ClkActivationTime) is a multiple of 3)
 – $G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK}$ if ((ADVOnTime – ClkActivationTime – 1) is a multiple of 3)
 – $G = (2 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK}$ if ((ADVOnTime – ClkActivationTime – 2) is a multiple of 3)
- For ADV rising edge (ADV deactivated) in Reading mode:
 Case GpmcFCLKDivider = 0:
 – $G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$
 Case GpmcFCLKDivider = 1:

- $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if (ClkActivationTime and ADVrDOffTime are odd) or (ClkActivationTime and ADVrDOffTime are even)
- $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if ((ADVrDOffTime – ClkActivationTime) is a multiple of 3)
- $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVrDOffTime – ClkActivationTime – 1) is a multiple of 3)
- $G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVrDOffTime – ClkActivationTime – 2) is a multiple of 3)

For ADV rising edge (ADV deactivated) in Writing mode:

Case GpmcFCLKDivider = 0:

- $G = 0.5 * ADVExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if (ClkActivationTime and ADVWrOffTime are odd) or (ClkActivationTime and ADVWrOffTime are even)
- $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $G = 0.5 * ADVExtraDelay * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime) is a multiple of 3)
- $G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime – 1) is a multiple of 3)
- $G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK$ if ((ADVWrOffTime – ClkActivationTime – 2) is a multiple of 3)

(8) For OE falling edge (OE activated) / IO DIR rising edge (IN direction):

Case GpmcFCLKDivider = 0:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and OEOnTime are odd) or (ClkActivationTime and OEOnTime are even)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime) is a multiple of 3)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime – 1) is a multiple of 3)
- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime – 2) is a multiple of 3)

For OE rising edge (OE deactivated):

Case GpmcFCLKDivider = 0:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and OEOffTime are odd) or (ClkActivationTime and OEOffTime are even)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime) is a multiple of 3)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime – 1) is a multiple of 3)
- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime – 2) is a multiple of 3)

(9) For WE falling edge (WE activated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and WEOnTime are odd) or (ClkActivationTime and WEOnTime are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if ((WEOnTime – ClkActivationTime) is a multiple of 3)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOnTime – ClkActivationTime – 1) is a multiple of 3)
- $I = (2 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOnTime – ClkActivationTime – 2) is a multiple of 3)

For WE rising edge (WE deactivated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and WEOffTime are odd) or (ClkActivationTime and WEOffTime are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEExtraDelay * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime)$ is a multiple of 3)
- $I = (1 + 0.5 * WEExtraDelay) * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime - 1)$ is a multiple of 3)
- $I = (2 + 0.5 * WEExtraDelay) * GPMC_FCLK$ if $((WEOffTime - ClkActivationTime - 2)$ is a multiple of 3)

(10) $J = GPMC_FCLK$ period

(11) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
In gpmc_waitx, x is equal to 0, 1, 2, or 3

(12) $P = gpmc_clk$ period

(13) For read: $K = (ADVRdOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$
For write: $K = (ADVWrOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

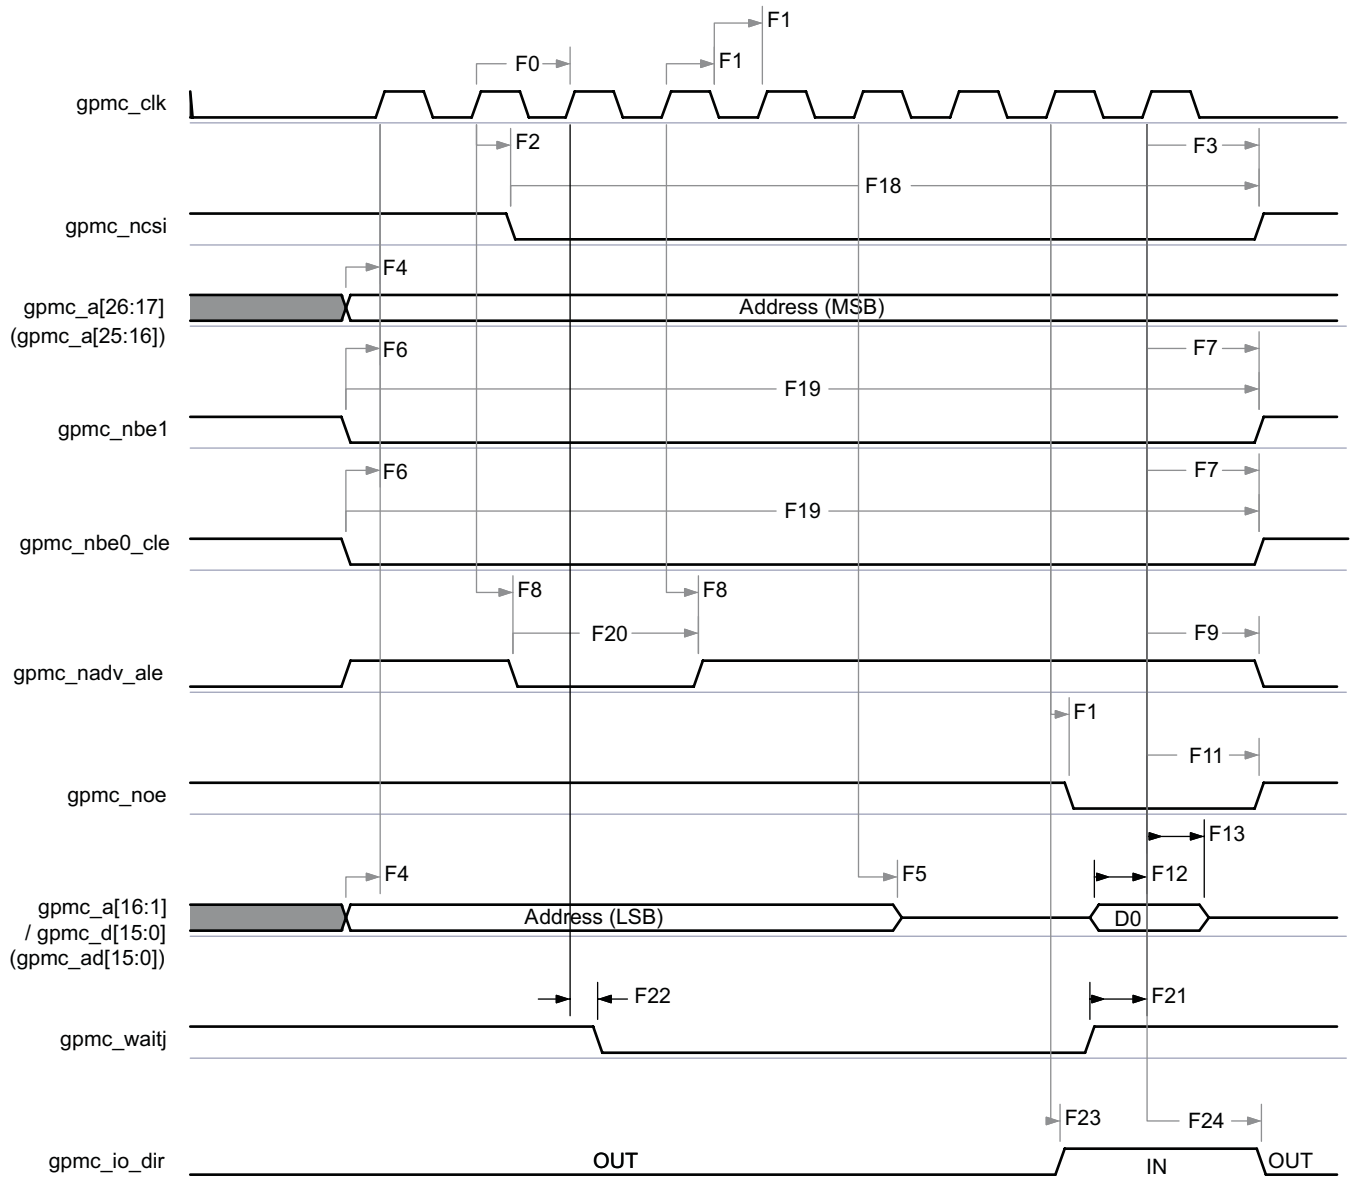

(14) GPMC_FCLK is general-purpose memory controller internal functional clock

(15) Related to the gpmc_clk output clock maximum and minimum frequency programmable in I/F module by setting the GPMC_CONFIG1_CSx configuration register bit fields GpmcFCLKDivider.

(16) The jitter probability density can be approximated by a Gaussian function

(17) $M = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

Above M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both RdCycleTime and BusTurnAround completion. Behaviour of IO direction signal does depend on kind of successive read/write accesses performed to memory and multiplexed or nonmultiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behaviour is automatically handled by GPMC controller.

- (3) Nonmultiplexed NOR interface can be used only with a limited address range corresponding to 10 address bits.

5.4.1.3 GPMC/NOR Flash Interface—Synchronous Mode—66 MHz

Table 5-9 and Table 5-10 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-12 through Figure 5-17).

Table 5-8. GPMC/NOR Flash Timing Conditions—Synchronous Mode—66 MHz⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1.38	2.79	ns
t _F	Input signal fall time	1.14	2.85	ns
PCB Conditions				
	Number of external peripherals		4	
	Far end load		15	pF

Table 5-8. GPMC/NOR Flash Timing Conditions—Synchronous Mode—66 MHz⁽¹⁾⁽²⁾⁽³⁾ (continued)

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
	Trace length		5	cm
	Characteristic impedance	40	55	Ω

(1) IO settings except gpmc_nwp: LB0 = 1.

For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment section of the OMAP4470 TRM.

IO settings for gpmc_nwp: MB[1:0] = 01 and LB0 = 0.

For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-9. GPMC/NOR Flash Timing Requirements—Synchronous Mode—66 MHz⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
F12	$t_{su(dV-clkH)}$	Setup time, input data gpmc_d[15:0] valid before output clock gpmc_clk high	3		17.8		ns
F13	$t_{h(clkH-dV)}$	Hold time, input data gpmc_d[15:0] valid after output clock gpmc_clk high	2.4		2.4		ns
F21	$t_{su(waitV-clkH)}$	Setup time, input wait gpmc_waitx ⁽¹⁾ valid before output clock gpmc_clk high	3		17.8		ns
F22	$t_{h(clkH-waitV)}$	Hold time, input wait gpmc_waitx ⁽¹⁾ valid after output clock gpmc_clk high	2.4		2.4		ns

(1) In gpmc_waitx, x is equal to 0, 1, 2 or 3.

(2) See DM Operating Condition Addendum for CORE OPP voltages.

For burst write:

$$- D = (\text{WrCycleTime} - \text{AccessTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK}$$

(5) For single read:

$$- E = (\text{CSRdOffTime} - \text{AccessTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK}$$

For burst read:

$$- E = (\text{CSRdOffTime} - \text{AccessTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK}$$

For burst write:

$$- E = (\text{CSWrOffTime} - \text{AccessTime}) * (\text{TimeParaGranularity} + 1) * \text{GPMC_FCLK}$$

(6) For nCS falling edge (CS activated):

Case GpmcFCLKDivider = 0:

$$- F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK}$$

Case GpmcFCLKDivider = 1:

$$- F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK} \text{ if } (\text{ClkActivationTime} \text{ and } \text{CSOnTime} \text{ are odd}) \text{ or } (\text{ClkActivationTime} \text{ and } \text{CSOnTime} \text{ are even})$$

$$- F = (1 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK} \text{ otherwise}$$

Case GpmcFCLKDivider = 2:

$$- F = 0.5 * \text{CSExtraDelay} * \text{GPMC_FCLK} \text{ if } ((\text{CSOnTime} - \text{ClkActivationTime}) \text{ is a multiple of } 3)$$

$$- F = (1 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{CSOnTime} - \text{ClkActivationTime} - 1) \text{ is a multiple of } 3)$$

$$- F = (2 + 0.5 * \text{CSExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{CSOnTime} - \text{ClkActivationTime} - 2) \text{ is a multiple of } 3)$$

(7) For ADV falling edge (ADV activated):

Case GpmcFCLKDivider = 0:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$$

Case GpmcFCLKDivider = 1:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } (\text{ClkActivationTime} \text{ and } \text{ADVOnTime} \text{ are odd}) \text{ or } (\text{ClkActivationTime} \text{ and } \text{ADVOnTime} \text{ are even})$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ otherwise}$$

Case GpmcFCLKDivider = 2:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } ((\text{ADVOnTime} - \text{ClkActivationTime}) \text{ is a multiple of } 3)$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVOnTime} - \text{ClkActivationTime} - 1) \text{ is a multiple of } 3)$$

$$- G = (2 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVOnTime} - \text{ClkActivationTime} - 2) \text{ is a multiple of } 3)$$

For ADV rising edge (ADV deactivated) in Reading mode:

Case GpmcFCLKDivider = 0:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$$

Case GpmcFCLKDivider = 1:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } (\text{ClkActivationTime} \text{ and } \text{ADVRdOffTime} \text{ are odd}) \text{ or } (\text{ClkActivationTime} \text{ and } \text{ADVRdOffTime} \text{ are even})$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ otherwise}$$

Case GpmcFCLKDivider = 2:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } ((\text{ADVRdOffTime} - \text{ClkActivationTime}) \text{ is a multiple of } 3)$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVRdOffTime} - \text{ClkActivationTime} - 1) \text{ is a multiple of } 3)$$

$$- G = (2 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVRdOffTime} - \text{ClkActivationTime} - 2) \text{ is a multiple of } 3)$$

For ADV rising edge (ADV deactivated) in Writing mode:

Case GpmcFCLKDivider = 0:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK}$$

Case GpmcFCLKDivider = 1:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } (\text{ClkActivationTime} \text{ and } \text{ADVWrOffTime} \text{ are odd}) \text{ or } (\text{ClkActivationTime} \text{ and } \text{ADVWrOffTime} \text{ are even})$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ otherwise}$$

Case GpmcFCLKDivider = 2:

$$- G = 0.5 * \text{ADVExtraDelay} * \text{GPMC_FCLK} \text{ if } ((\text{ADVWrOffTime} - \text{ClkActivationTime}) \text{ is a multiple of } 3)$$

$$- G = (1 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVWrOffTime} - \text{ClkActivationTime} - 1) \text{ is a multiple of } 3)$$

$$- G = (2 + 0.5 * \text{ADVExtraDelay}) * \text{GPMC_FCLK} \text{ if } ((\text{ADVWrOffTime} - \text{ClkActivationTime} - 2) \text{ is a multiple of } 3)$$

(8) For OE falling edge (OE activated) / IO DIR rising edge (IN direction):

Case GpmcFCLKDivider = 0:

$$- H = 0.5 * \text{OEEExtraDelay} * \text{GPMC_FCLK}$$

Case GpmcFCLKDivider = 1:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and OEOnTime are odd) or (ClkActivationTime and OEOnTime are even)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime) is a multiple of 3)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime – 1) is a multiple of 3)
- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOnTime – ClkActivationTime – 2) is a multiple of 3)

For OE rising edge (OE deactivated):

Case GpmcFCLKDivider = 0:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and OEOffTime are odd) or (ClkActivationTime and OEOffTime are even)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $H = 0.5 * OEEExtraDelay * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime) is a multiple of 3)
- $H = (1 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime – 1) is a multiple of 3)
- $H = (2 + 0.5 * OEEExtraDelay) * GPMC_FCLK$ if ((OEOffTime – ClkActivationTime – 2) is a multiple of 3)

(9) For WE falling edge (WE activated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and WEOOnTime are odd) or (ClkActivationTime and WEOOnTime are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if ((WEOOnTime – ClkActivationTime) is a multiple of 3)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOOnTime – ClkActivationTime – 1) is a multiple of 3)
- $I = (2 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOOnTime – ClkActivationTime – 2) is a multiple of 3)

For WE rising edge (WE deactivated):

Case GpmcFCLKDivider = 0:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$

Case GpmcFCLKDivider = 1:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if (ClkActivationTime and WEOffTime are odd) or (ClkActivationTime and WEOffTime are even)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ otherwise

Case GpmcFCLKDivider = 2:

- $I = 0.5 * WEEExtraDelay * GPMC_FCLK$ if ((WEOffTime – ClkActivationTime) is a multiple of 3)
- $I = (1 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOffTime – ClkActivationTime – 1) is a multiple of 3)
- $I = (2 + 0.5 * WEEExtraDelay) * GPMC_FCLK$ if ((WEOffTime – ClkActivationTime – 2) is a multiple of 3)

(10) $J = GPMC_FCLK$ period

(11) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(12) $P = gpmc_clk$ period

(13) For read: $K = (ADVROffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

For write: $K = (ADVWROffTime - ADVWROnTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

(14) $GPMC_FCLK$ is General Purpose Memory Controller internal functional clock.

(15) Related to the gpmc_clk output clock maximum and minimum frequency programmable in I/F module by setting the $GPMC_CONFIG1_CSx$ configuration register bit fields GpmcFCLKDivider

(16) The jitter probability density can be approximated by a Gaussian function.

(17) $M = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK$

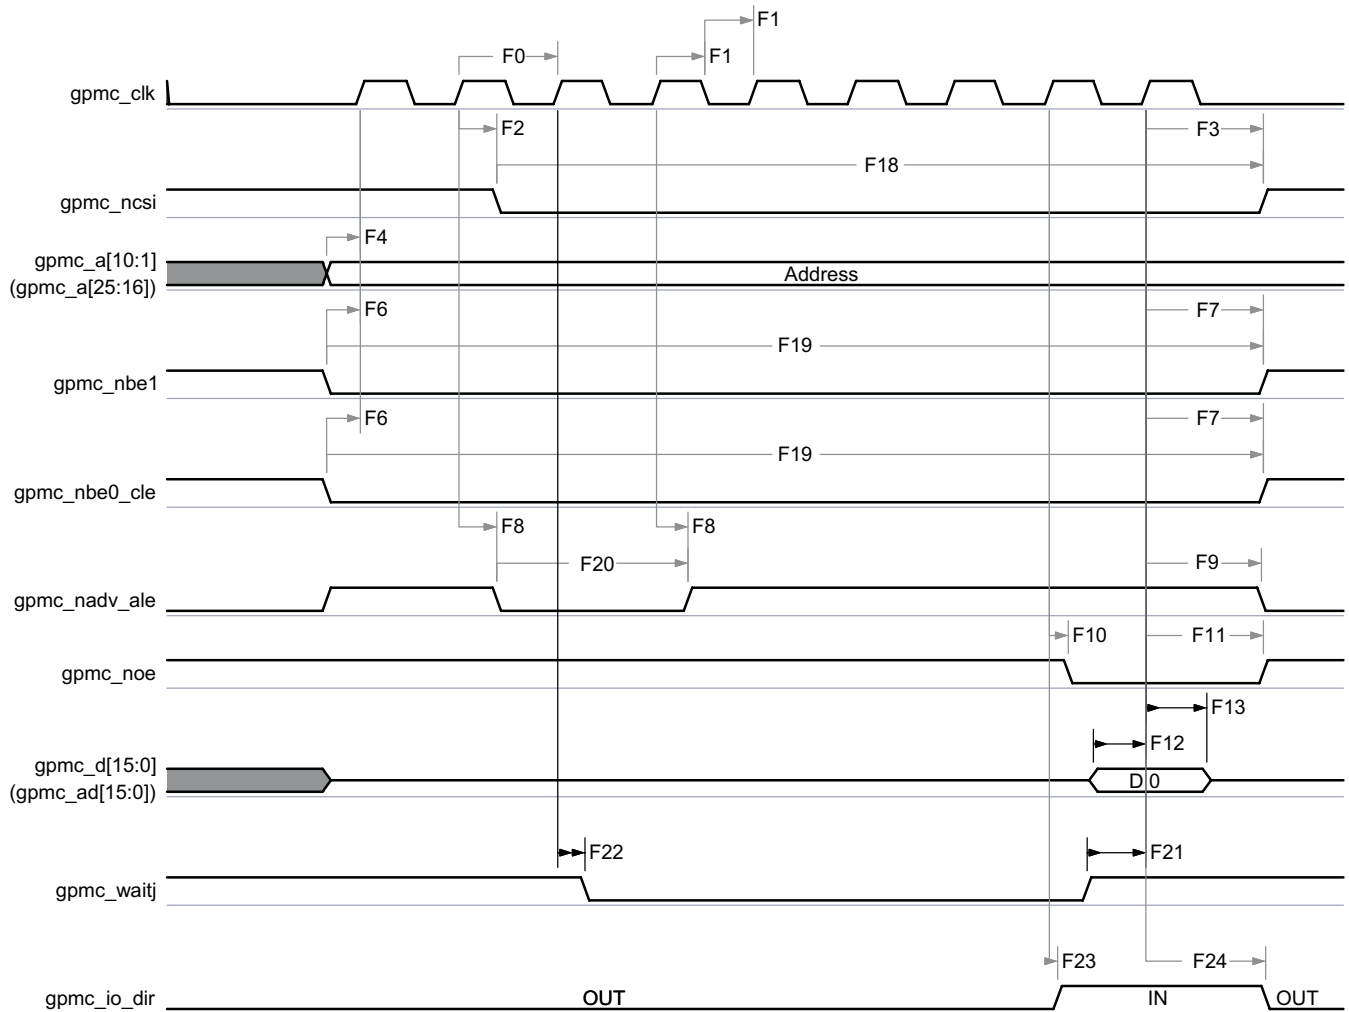

Above M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both RdCycleTime and BusTurnAround completion. Behaviour of IO direction signal does depend on kind of successive Read/Write accesses performed to Memory and multiplexed or nonmultiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behaviour is automatically handled by GPMC controller.

5.4.1.4 GPMC/NOR Flash Interface—Asynchronous Mode

Table 5-13 and Table 5-14 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-18 through Figure 5-23).

Table 5-11. GPMC/NOR Flash Timing Conditions—Asynchronous Mode⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1.80		ns
t _F	Input signal fall time	1.80		ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		10	pF
	Trace length		4	cm
	Characteristic impedance	30	50	Ω

- (1) IO settings except gpmc_nwp: LB0 = 1.
For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment section of the OMAP4470 TRM.
IO settings for gpmc_nwp: MB[1:0] = 01 and LB0 = 0.
For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 20% to 80% of VDDS. For more information on the corresponding OMAP4 VDDS power supply name, see [Table 2-1](#), POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-12. GPMC/NOR Flash—Asynchronous Mode—Internal Parameters

NO.	PARAMETER	OPP100, OPP119		OPP50		UNIT
		MIN	MAX	MIN	MAX	
FI1	Max output data generation delay from internal functional clock		6.5		13.7	ns
FI2	Max input data capture delay by internal functional clock		4.0		8.1	ns
FI3	Max chip select generation delay from internal functional clock		6.5		13.7	ns
FI4	Max address generation delay from internal functional clock		6.5		13.7	ns
FI5	Max address valid generation delay from internal functional clock		6.5		13.7	ns
FI6	Max byte enable generation delay from internal functional clock		6.5		13.7	ns
FI7	Max output enable generation delay from internal functional clock		6.5		13.7	ns
FI8	Max write enable generation delay from internal functional clock		6.5		13.7	ns
FI9	Max functional clock skew		100.0		200.0	ps
FI10	Max IO direction generation delay from internal functional clock		6.5		13.7	ps

Table 5-13. GPMC/NOR Flash Timing Requirements—Asynchronous Mode⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
FA5	t _{ACC(DAT)}	Data max access time		H ⁽⁸⁾		H ⁽⁸⁾	GPMC_FCLK cycles
FA20	t _{ACC1-PGMODE(DAT)}	Page mode successive data max access time		P ⁽¹⁵⁾		P ⁽¹⁵⁾	GPMC_FCLK cycles
FA21	t _{ACC2-PGMODE(DAT)}	Page mode first data max access time		H ⁽⁸⁾		H ⁽⁸⁾	GPMC_FCLK cycles

- (1) FA5 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.
- (2) FA21 parameter illustrates amount of time required to internally sample first input Page Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, First input Page Data will be internally sampled by active functional clock edge. FA21 value must be stored inside AccessTime register bits field.
- (3) FA20 parameter illustrates amount of time required to internally sample successive input Page Data. It is expressed in number of GPMC functional clock cycles. After each access to input Page Data, next input Page Data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 value must be stored in PageBurstAccessTime register bits field.

Table 5-14. GPMC/NOR Flash Switching Characteristics—Asynchronous Mode

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	t _{R(DO)}	Rise time, output data		2		2	ns
	t _{F(DO)}	Fall time, output data		2		2	ns
FA0	t _{w(NBEV)}	Pulse duration, gpmc_nbe0_cle, gpmc_nbe1 valid time	Read	N ⁽¹³⁾		N ⁽¹³⁾	ns
			Write	N ⁽¹³⁾		N ⁽¹³⁾	ns
FA1	t _{w(NCSV)}	Pulse duration, gpmc_ncsx low	Read	A ⁽¹⁾		A ⁽¹⁾	ns
			Write	A ⁽¹⁾		A ⁽¹⁾	ns

Figure 5-18. GPMC / NOR Flash—Asynchronous Read—Single Word Timing⁽¹⁾⁽²⁾⁽³⁾

(1) In `gpmc_ncsx`, `x` is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In `gpmc_waitx`, `x` is equal to 0, 1, 2, or 3.

(2) `FA5` parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after `FA5` functional clock cycles, input data will be internally sampled by active functional clock edge. `FA5` value must be stored inside `AccessTime` register bits field.

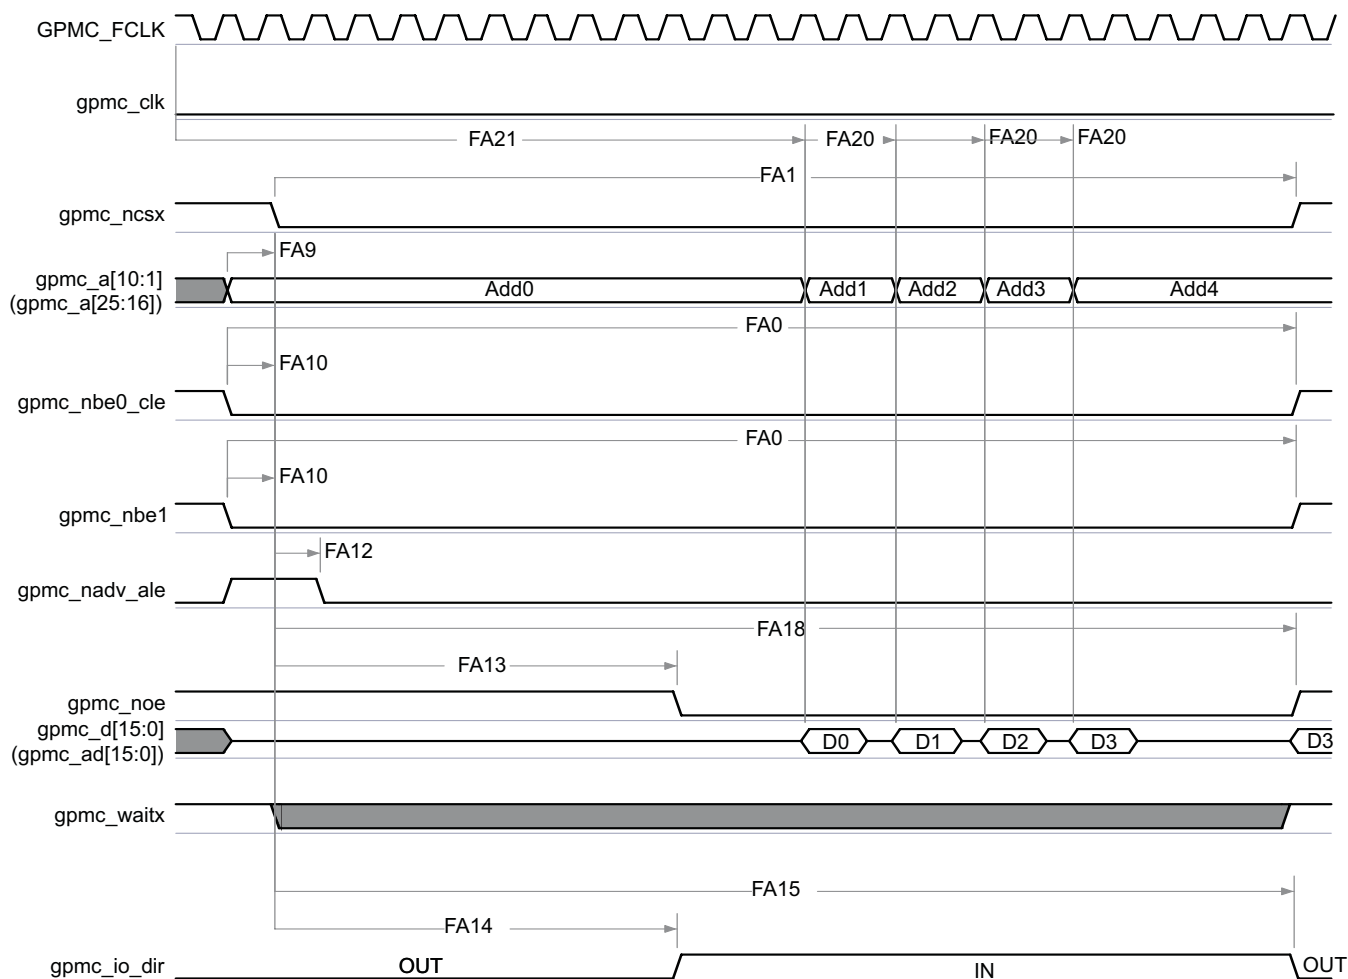

(3) `GPMC_FCLK` is an internal clock (GPMC functional clock) not provided externally.

SWPS040-012

Figure 5-19. GPMC / NOR Flash—Asynchronous Read—32-bit Timing⁽¹⁾⁽²⁾⁽³⁾

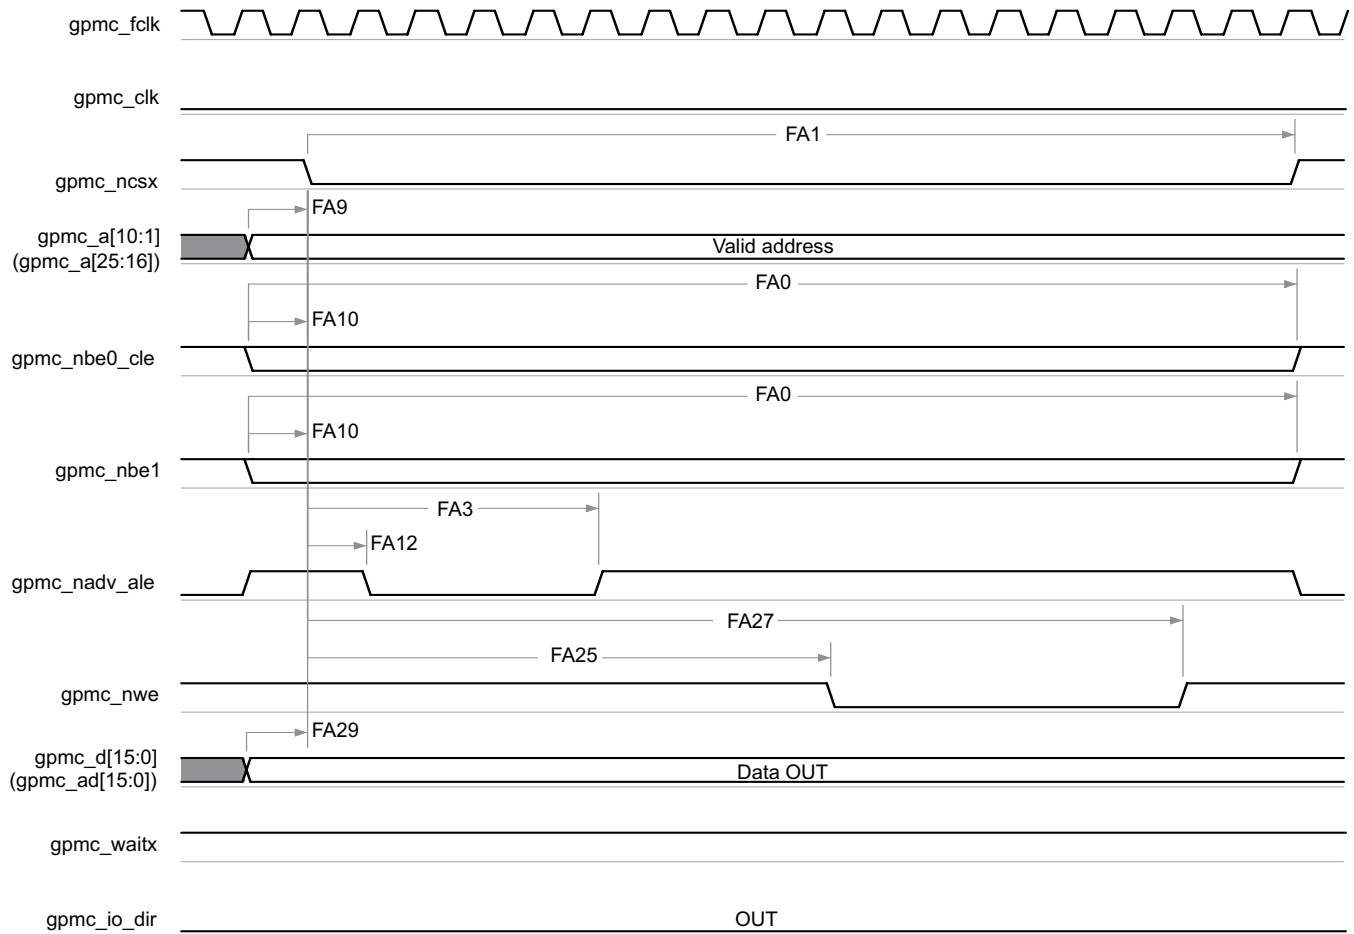

- (1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.
- (2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.
- (3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

SWPS040-013

Figure 5-20. GPMC / NOR Flash—Asynchronous Read—Page Mode 4x16-bit Timing⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

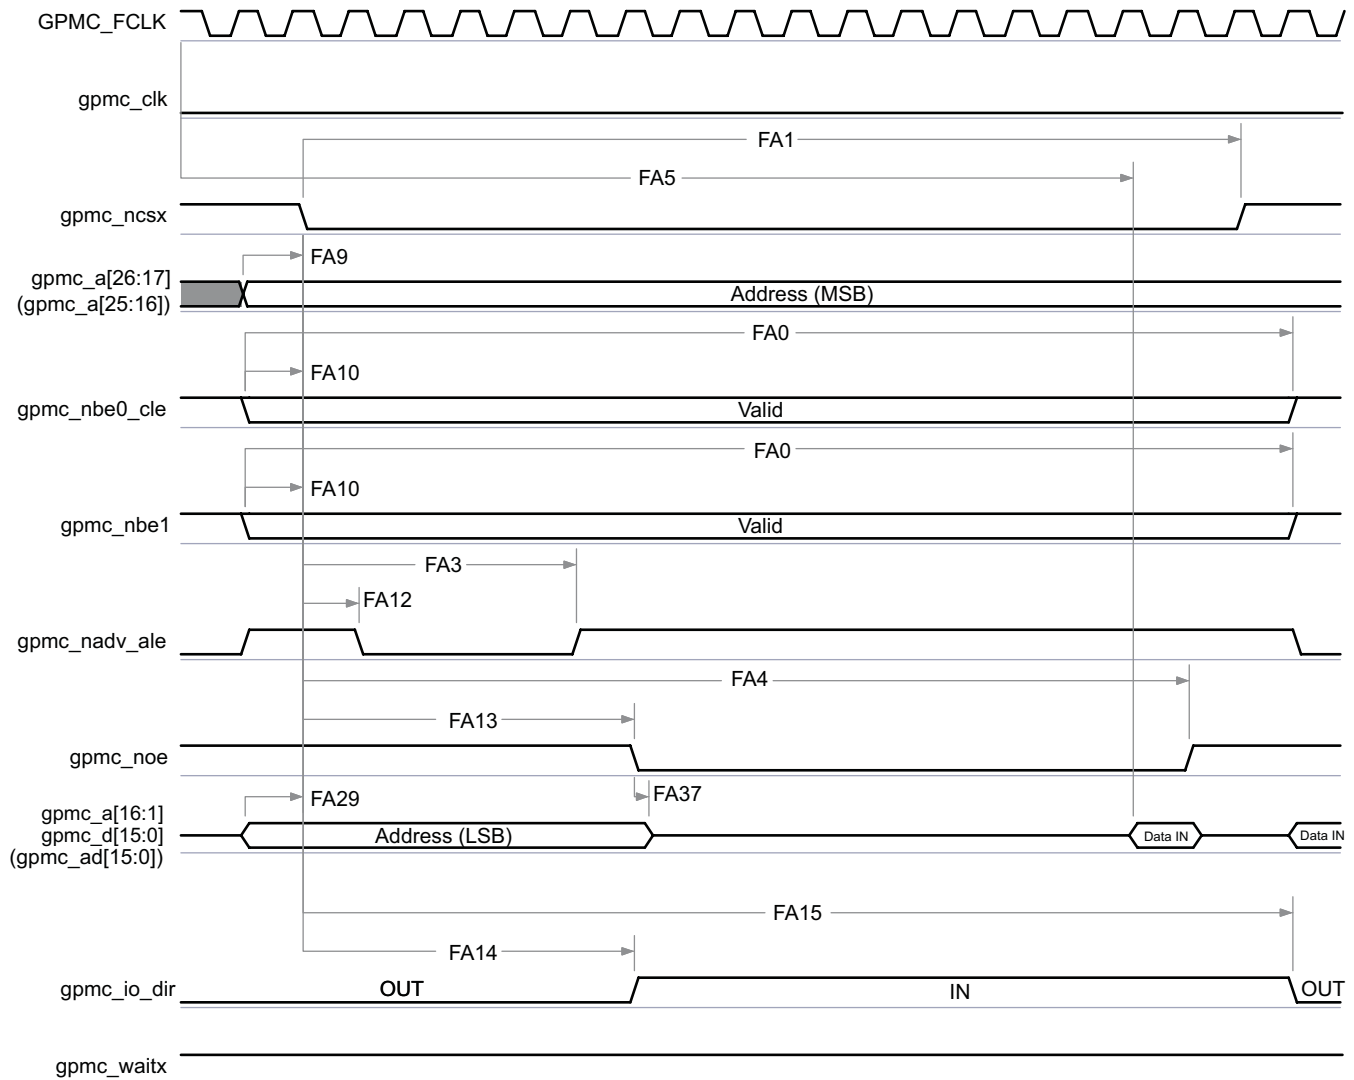

- (1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, or 2.
- (2) FA21 parameter illustrates amount of time required to internally sample first input Page Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, First input Page Data will be internally sampled by active functional clock edge. FA21 calculation must be stored inside AccessTime register bits field.
- (3) FA20 parameter illustrates amount of time required to internally sample successive input Page Data. It is expressed in number of GPMC functional clock cycles. After each access to input Page Data, next input Page Data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input Page Data (excluding first input Page Data). FA20 value must be stored in PageBurstAccessTime register bits field.
- (4) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

SWPS040-014

Figure 5-21. GPMC / NOR Flash—Asynchronous Write—Single Word Timing⁽¹⁾

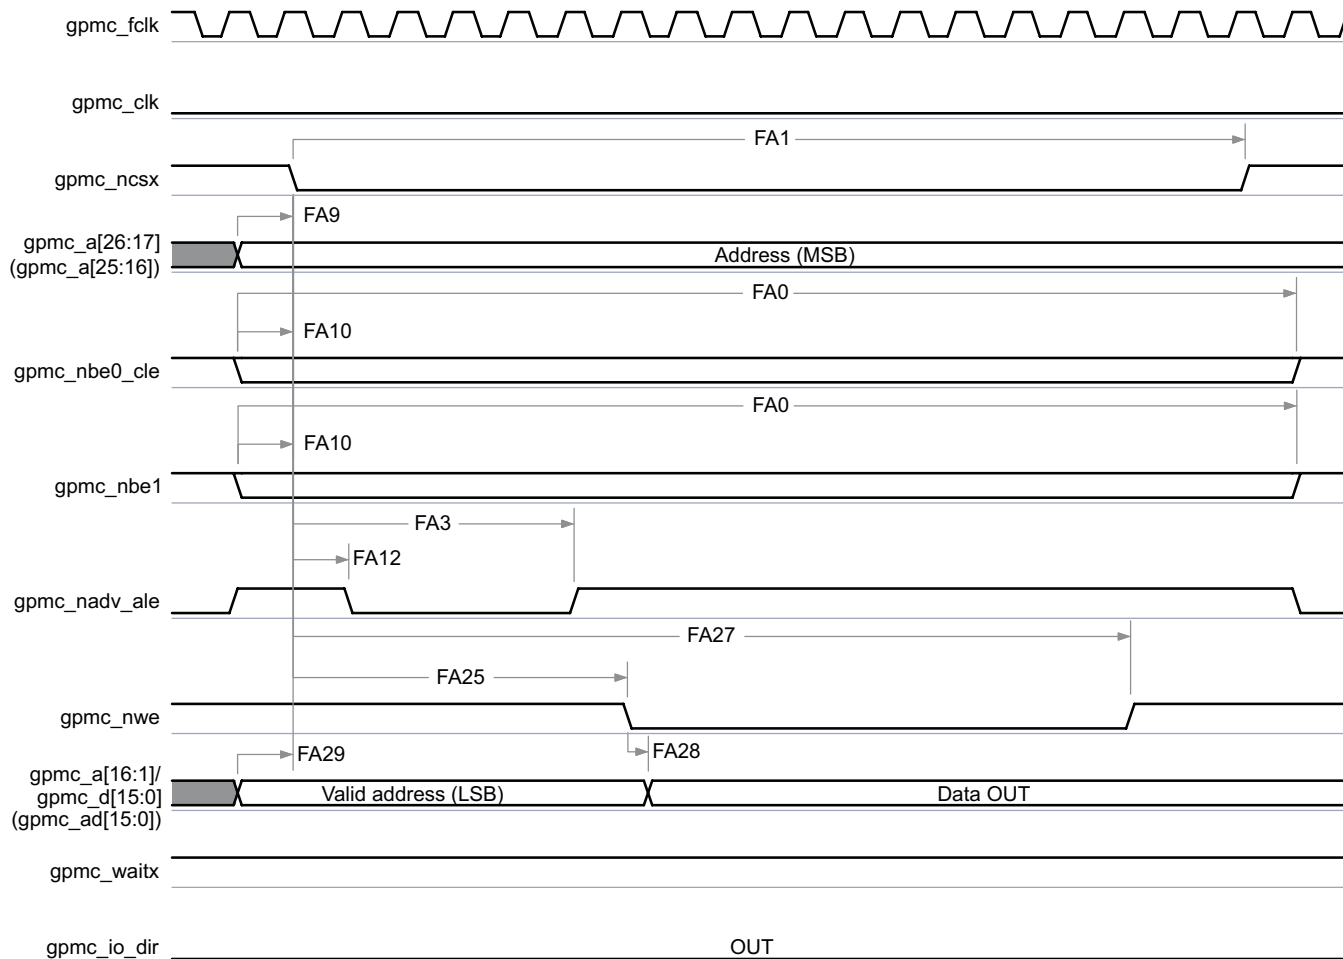

(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, or 2.

SWPS040-015

Figure 5-22. GPMC / Multiplexed NOR Flash—Asynchronous Read—Single Word Timing⁽¹⁾⁽²⁾⁽³⁾

- (1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, or 2.
- (2) FA5 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.
- (3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

SWPS040-016

Figure 5-23. GPMC / Multiplexed NOR Flash—Asynchronous Write—Single Word Timing⁽¹⁾

(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, or 2.

5.4.1.5 GPMC/NAND Flash Interface—Asynchronous Mode

Table 5-17 and Table 5-18 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-24 through Figure 5-27).

Table 5-15. GPMC/NAND Flash Timing Conditions—Asynchronous Mode⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time		1.80	ns
t _F	Input signal fall time		1.80	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		10	pF
	Trace length		4	cm
	Characteristic impedance	30	50	Ω

- (1) IO settings except gpmc_nwp: LB0 = 1.
For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment section of the OMAP4470 TRM.
IO settings for gpmc_nwp: MB[1:0] = 01 and LB0 = 0.
For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 20% to 80% of VDDS. For more information on the corresponding OMAP4 VDDS power supply name, see [Table 2-1](#), POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-16. GPMC/NAND—Asynchronous Mode—Internal Parameters

NO.	PARAMETER	OPP100, OPP119		OPP50		UNIT
		MIN	MAX	MIN	MAX	
GNF1	Maximum output data generation delay from internal functional clock		6.5		13.7	ns
GNF2	Maximum input data capture delay by internal functional clock		4.0		8.1	ns
GNF3	Maximum chip select generation delay from internal functional clock		6.5		13.7	ns
GNF4	Maximum address latch enable generation delay from internal functional clock		6.5		13.7	ns
GNF5	Maximum command latch enable generation delay from internal functional clock		6.5		13.7	ns
GNF6	Maximum output enable generation delay from internal functional clock		6.5		13.7	ns
GNF7	Maximum write enable generation delay from internal functional clock		6.5		13.7	ns
GNF8	Maximum functional clock skew		100.0		200.0	ps

Table 5-17. GPMC/NAND Flash Timing Requirements—Asynchronous Mode⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
GNF12	t _{ACC(DAT)}	Data maximum access time		J ⁽¹⁰⁾		J ⁽¹⁰⁾	GPMC_FCLK cycles

- (1) GNF12 parameter illustrates amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after GNF12 functional clock cycles, input data will be internally sampled by active functional clock edge. GNF12 value must be stored inside AccessTime register bits field.
- (2) See DM Operating Condition Addendum for CORE OPP voltages.

5.4.2 External Memory Interface (EMIF)

NOTE

For more information, see the EMIF Controller section of the OMAP4470 TRM.

The SDRAM controller subsystem module provides connectivity between the processor and external DRAM memory components. The module includes support for double-data-rate SDRAM (mobile DDR).

5.4.2.1 EMIF—DDR Mode—400 MHz

Table 5-20 and Table 5-21 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-28 through Figure 5-49). For timing parameters correspondence with JEDEC standard, see Table 5-25 and Table 5-26.

Table 5-19. EMIF Timing Conditions—DDR Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input rise time		0.4	ns
t _F	Input fall time		0.4	ns
Output Condition				
C _{LOAD}	Output load capacitance ⁽¹⁾	2	5	pF

(1) IO settings: sr[1:0] = 11.

For more information, see the Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / High-speed I/O Buffers with Impedance, Slew Rate and Weak Driver Settings section of the OMAP4470 TRM.

Mode Register Parameters							
DD700	$t_{d(MRW)}$	Delay time, MODE REGISTER WRITE command	5		5		DD100
DD701	$t_{d(MRR)}$	Delay time, MODE REGISTER READ command	2		2		DD100
ZQ Calibration Parameters							

Table 5-21. EMIF Switching Characteristics—DDR Mode⁽⁵⁾⁽⁶⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DD800	$t_{d(QINIT)}$	Delay time, Initialization Calibration command		1		1	μ s
DD801	$t_{d(QCL)}$	Delay time, Long Calibration command		360		360	ns
DD802	$t_{d(QCS)}$	Delay time, Short Calibration command		90		90	ns
DD803	$t_{d(QRESET)}$	Delay time, Calibration Reset command		50		50	ns

(1) X = [3:0]

(2) Y = [31:0]

(3) Z = [9:0]

(4) Per device density:

- In the range [64 Mbits to 512 Mbits], density = 90 ns
- In the range [1 Gbit to 4 Gbits], density = 130 ns
- For 8 Gbits, density = 210 ns

(5) In this table, LPDDR2 means LPDDR21 and LPDDR22. For more information, see [Table 2-4](#).

(6) See DM Operating Condition Addendum for CORE OPP voltages.

5.4.2.2 EMIF—DDR Mode—466 MHz (Overdrive)

[Table 5-23](#) and [Table 5-24](#) assume testing over the recommended operating conditions and electrical characteristic conditions below (see [Figure 5-28](#) through [Figure 5-49](#)). For timing parameters correspondence with JEDEC standard, see [Table 5-25](#) and [Table 5-26](#).

Table 5-22. EMIF Timing Conditions—DDR Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input rise time		0.4	ns
t_F	Input fall time		0.4	ns
Output Condition				
C_{LOAD}	Output load capacitance ⁽¹⁾	2	5	pF

(1) IO settings: sr[1:0] = 11

For more information, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / High-speed I/O Buffers with Impedance, Slew Rate and Weak Driver Settings section of the OMAP4470 TRM.

Table 5-23. EMIF Timing Requirements—DDR Mode⁽³⁾⁽⁴⁾

(1) $x = [3:0]$

(2) $y = [31:0]$

(3) $z = [9:0]$

(4) The timing correspondence in this table means that a system equation exists between the Data Manual parameters and the JEDEC ones.

5.5 Multimedia Interfaces

5.5.1 Camera Interface

The camera subsystem supports most of the raw image sensors available in the market. It contains two serial interfaces compatible with the CCP, MIPI® CSI1, and CSI2 protocols.

The main serial interface, CSI21, supports up to 4 data lanes (824 Mb/s maximum with 4 data lanes (412 MHz), 1Gb/s maximum with 3, 2, or 1 data lane(s) (500 MHz)) using CSI2 MIPI® standard.

The secondary CSI22 interface provides both CSI2 and CCP2 / CSI1 modes:

- CSI2 at 500 MHz (1 Gbps) in double data rate (DDR) mode

- CCP2 at 325 MHz (650 Mbps) in double data rate (DDR) mode
- CSI1 at 208 MHz (208 Mbps) in single data rate (SDR) mode

5.5.1.1 Camera Serial Interface (CSI2)

CSI2 camera serial interface is a MIPI® (MIPI® CSI2) D-PHY compliant interface connecting a digital camera module and a mobile phone application. This interface is made of three differential lanes, each of them being configurable for carrying data or clock. The polarity of each wire of a lane is also configurable.

5.5.1.1.1 CSI21 and CSI22—High-Speed Mode

Table 5-28 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-50).

NOTE

If the skew degradation due to the interconnect (from the output transmitter ball to the input receiver ball) between the clock and the data lanes is less than ±170 ps (instead of ±200 ps in the MIPI D-PHY specification) then 1Gbps per data lane is achievable with 4 data lanes at OPP100 operating point. This must be met for an interconnect length less than 10 cm.

Table 5-27. CSI21 and CSI22 Timing Conditions—High-Speed Mode⁽¹⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions: Up to 3 data lanes				
t _R	Input signal rise time ⁽²⁾	0.135	0.4 * t _{UI(INST,MIN)}	ns
t _F	Input signal fall time ⁽²⁾	0.135	0.4 * t _{UI(INST,MIN)}	ns
Input Conditions: 4 data lanes				
t _R	Input signal rise time ⁽²⁾	0.166	0.4 * t _{UI(INST,MIN)}	ns
t _F	Input signal fall time ⁽²⁾	0.166	0.4 * t _{UI(INST,MIN)}	ns

(1) For more information about t_{UI(INST,MIN)} timing, see the CS6 parameter defined in Table 5-28.

(2) Rise time or fall time are evaluated between differential input high threshold V_{IDTH} and differential input low threshold V_{IDTL}. For more information about V_{IDTH} and V_{IDTL} values, please see the MIPI D-PHY standard v1.0, High-Speed Receiver section.

(3) For more information on the PCB requirements, see Section A.4.3, MIPI D-PHY PCB Guidelines in OMAP4.

Table 5-28. CSI21 and CSI22 Timing Requirements—High-Speed Mode⁽²⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
Up to 3 Data Lanes							
CS1	1 / t _{C(clk)}	Frequency, input clock period		500		400	MHz
CS2, CS3	t _{UI(NOM)}	Minimum unit interval	1.0 ⁽³⁾		1.25 ⁽³⁾		ns
CS6	t _{UI(INST,MIN)}	Minimum instantaneous bit duration	0.9 ⁽⁴⁾		1.12 ⁽⁴⁾		ns
CS4	t _{SU(dV-clkH)}	Setup time, data valid before clock rising edge	0.135 ⁽⁵⁾		0.168 ⁽⁵⁾		ns
CS5	t _{H(clkH-dV)}	Hold time, data valid after clock rising edge	0.135 ⁽⁵⁾		0.168 ⁽⁵⁾		ns
4 Data Lanes							
CS1	1 / t _{C(clk)}	Frequency, input clock period		412 ⁽⁷⁾		400	MHz
CS2, CS3	t _{UI(NOM)}	Minimum unit interval	1.21 ⁽³⁾		1.25 ⁽³⁾		ns
CS6	t _{UI(INST,MIN)}	Minimum instantaneous bit duration	1.09 ⁽⁴⁾		1.12 ⁽⁴⁾		ns
CS4	t _{SU(dV-clkH)}	Setup time, input data valid before input clock rising edge	0.163 ⁽⁵⁾		0.168 ⁽⁵⁾		ns

Table 5-28. CSI21 and CSI22 Timing Requirements—High-Speed Mode⁽²⁾⁽⁶⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
CS5	$t_{h(\text{clkH-dV})}$	Hold time, input data valid after input clock rising edge	0.163 ⁽⁵⁾		0.168 ⁽⁵⁾		ns

(1) Related to the input maximum frequency supported by the CSI21 and CSI22 modules.

(2) The timing requirements are assured up to the minimum instantaneous bit duration.

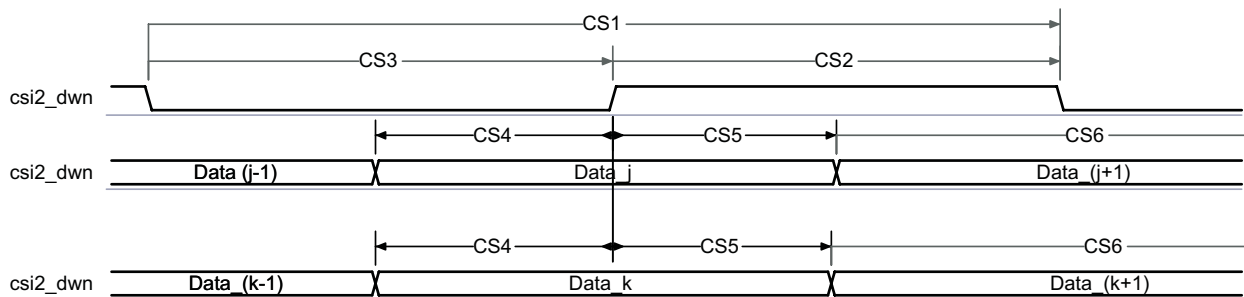

(3) $t_{UI(\text{NOM})}$ is the minimum unit interval. $t_{UI(\text{NOM})} = 0.5 \times t_{c(\text{clk})}$.

(4) $t_{UI(\text{INST,MIN})}$ is the minimum instantaneous bit duration = $0.9 \times t_{UI(\text{NOM})}$.

(5) Setup/hold time = $0.15 \times t_{UI(\text{INST,MIN})}$

(6) See DM Operating Condition Addendum for OPP voltages.

(7) If the skew degradation due to the interconnect (from the output transmitter ball to the input receiver ball) between the clock and the data lanes is less than ± 170 ps (instead of ± 200 ps in the MIPI D-PHY specification) then 1Gbps per data lane is achievable with 4 data lanes at OPP100 or OPP119 operating point. This must be met for an interconnect length less than 10 cm.

SWPS040-043

Figure 5-50. CSI21 and CSI22—High-Speed Mode⁽¹⁾⁽²⁾⁽³⁾

(1) In csi2z_dwn, w is equal to x or y, n is equal to 0, 1, 2, 3, or 4 and z is equal to 1 or 2.

(2) The use of each csi2z_dwn lane (clock or data) is software programmable with the CSI2[1 or 2]_COMPLEXIO_CFG1 register, by setting bits field CLOCK_POSITION to 0x1, 0x2, 0x3, 0x4, 0x5.

(3) The polarity of each csi2z_dwn lane is software programmable with the CSI2[1 or 2]_COMPLEXIO_CFG1 register, DATAi_POL bit field.

5.5.1.1.2 CSI21 and CSI22—Low-Power and Ultralow-Power Modes

Table 5-30 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-51).

Table 5-29. CSI21 and CSI22 Timing Conditions—Low-Power and Ultralow-Power Modes⁽²⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time ⁽¹⁾	2.6	25	ns
t_F	Input signal fall time ⁽¹⁾	2.6	25	ns

(1) Rise or fall time between 15% and 85% of the full signal swing. Input rise and fall times (t_R and t_F) are not applicable for clock lane.

(2) For more information on the PCB requirements, see Section A.4.3, MIPI D-PHY PCB Guidelines in OMAP4.

Table 5-30. CSI21 and CSI22 Timing Requirements—Low-Power and Ultralow-Power Modes⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
CS7	$t_{V(\text{LPstate})}$	Duration of a low-power state ⁽¹⁾	20		20		ns
	$t_{c(\text{xorclk})}$	Period of the LP exclusive-OR clock	90		90		ns

- (1) Low-power and ultralow-power communication modes are asynchronous, data is Spaced-One-Hot bit encoded, data transfer clock is recovered by means of an XOR between csi2z_dxn and csi2z_dyn with n = 0, 1, 2, 3, or 4 and z is equal to 1 or 2. For more information about the LP exclusive-OR clock, see Table 19 of MIPI D-PHY standard v1.0.
- (2) See DM Operating Condition Addendum for CORE OPP voltages.

Figure 5-51. CSI21 and CSI22—Low-Power and Ultralow-Power Modes⁽¹⁾⁽²⁾

- (1) In csi2z_dxn and csi2z_dyn, n is equal to 0, 1, 2, 3, or 4 and z is equal to 1 or 2.
- (2) Low-power and ultralow-power communication modes are asynchronous, data is Spaced-One-Hot bit encoded, data transfer clock is recovered by means of an XOR between csi2[1 or 2]_dxn and csi2[1 or 2]_dyn.

5.5.1.2 Camera Serial Interface (CCP2—CSI22)

Camera serial interface CCP2 is a MIPI serial interface supporting the following input data formats: YUV420, YUV422, RGB444, RGB565, RGB888, RAW6, RAW7, RAW8, RAW10, RAW12, or JPEG8. Clock and data are transferred on a differential SubLVDS link.

Table 5-32 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-52 and Figure 5-53).

Table 5-31. CCP2—CSI22—Timing Conditions⁽²⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
CCP2 – Class 0 and Class 1/2 Input Conditions				
t _R	Input signal rise time ⁽¹⁾	0.3	0.6	ns
t _F	Input signal fall time ⁽¹⁾	0.3	0.6	ns
Δt _{RF}	Difference between rise / fall time of input data and input clock	-0.1	0.1	ns

- (1) Rise or fall time between 20% and 80% of the full signal swing.
- (2) For more information on the PCB requirements, see Section A.4.3, MIPI D-PHY PCB Guidelines in OMAP4.

Table 5-32. CCP2—CSI22—Timing Requirements⁽³⁾

NO.	PARAMETER	OPP100, OPP119		OPP50		UNIT
		MIN	MAX	MIN	MAX	
CCP2 – Class 0						
CS0	1 / t _c (strb)	Frequency ⁽²⁾ , input clock		208	208	MHz
CS1, CS2	t _w (strb)	Pulse duration, input clock high or low		0.45*P ⁽¹⁾	0.55*P ⁽¹⁾	ns
CS3	t _{su} (datV-strbH)	Setup time, input data valid before input clock rising edge		0.8	0.8	ns
CS4	t _h (strbH-datV)	Hold time, input data valid after input clock rising edge		0.8	0.8	ns
CCP2 – Class 1						
CS10	1 / t _c (strb)	Frequency ⁽²⁾ , input strobe		208	208	MHz
CS11, CS17	t _w (strb)	Pulse width, input strobe and input data		1.1	1.1	ns

Table 5-32. CCP2—CSI22—Timing Requirements⁽³⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
CS12	$t_{sk(datV-strbH)}$	Skew time, input data valid before input strobe rising edge	0.78		0.78		ns
CS13	$t_{sk(strbH-datV)}$	Skew time, input data valid after input strobe falling edge	0.78		0.78		ns
CCP2 – Class 2							
CS10	$1 / t_c(strb)$	Frequency ⁽²⁾ , input strobe		325		325	MHz
CS11, CS17	$t_w(strb)$	Pulse width, input strobe and input data	1.1		1.1		ns
CS12	$t_{sk(datV-strbH)}$	Skew time, input data valid before input strobe rising edge	0.78		0.78		ns
CS13	$t_{sk(strbH-datV)}$	Skew time, input data valid after input strobe falling edge	0.78		0.78		ns

(1) P = clock period in ns

(2) The maximum clock frequency of the CCP2 must be chosen to be the lowest possible for the application / transmitting device to reduce the power consumption of the sensor, the IO pad of the device and the camera core module itself.

(3) See DM Operating Condition Addendum for CORE OPP voltages.

**Figure 5-52. CCP2—CSI22—Class 0⁽¹⁾⁽²⁾⁽³⁾**

(1) ccpv2_dx0/ccpv2_dy0 and ccpv2_dx1/ccpv2_dy1 are the result of low-voltage differential data signal converters (see the Camera Subsystem in OMAP4470 TRM).

(2) The CCP2 receives up to 208 Mbps data rate or data/clock transmission.

(3) The CCP2 supports YUV422, YUV420, Bayer RGB444, RGB565, RGB888, RAW Bayer 6-, 7-, 8-, 10-, and 12-bit, and JPEG8 input data formats.

**Figure 5-53. CCP2—CSI22—Class 1, Class 2⁽¹⁾⁽²⁾⁽³⁾**

(1) ccpv2_dx0/ccpv2_dy0 and ccpv2_dx1/ccpv2_dy1 are the result of low-voltage differential data signal converters (see the Camera Subsystem in OMAP4470 TRM).

(2) The CCP2 receives up to 208 Mbps data rate or data/clock transmission and up to 416 or 650 Mbps data rate for data/strobe transmission.

(3) The CCP2 supports YUV422, YUV420, Bayer RGB444, RGB565, RGB888, RAW Bayer 6-, 7-, 8-, 10-, and 12-bit, and JPEG8 input data formats.

5.5.1.3 Parallel Camera Interface (CPI)

5.5.1.3.1 CPI—Video and Graphics Digitizer 1.8-V Mode

The imaging subsystem deals with the processing of the pixel data coming from an external image sensor or from video and graphics digitizer. It is a key component for the following multimedia applications: video preview, camera viewfinder, video record, and still image capture. It supports RAW, RGB, and YUV data processing.

Table 5-34 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-54 and Figure 5-55).

Table 5-33. CPI Timing Conditions—Video and Graphics Digitizer 1.8-V Mode⁽¹⁾⁽²⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	80	1800	ps
t _F	Input signal fall time	80	1800	ps
PCB Conditions				
	Number of external peripherals		1	
	Trace length	2	10	cm
	Characteristic impedance	30	50	Ω

- (1) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.
- (2) IO settings: Balls T27 / G27 / U27 / G28 / V27 / F28 (cam_shutter, cam_strobe, cam_globalreset): SC[1:0] = 10. For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / Low Speed I/Os Combined Slew Rate vs TL Length and Load Settings section of the OMAP4470 TRM.

Table 5-34. CPI Timing Requirements—Video and Graphics Digitizer 1.8-V Mode⁽⁴⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		UNIT
			MIN	MAX	
ISP1	1 / t _c (pclk)	Frequency ⁽¹⁾ , input pixel clock cam2_pclk		148.5	MHz
ISP2	t _w (pclkL)	Typical pulse duration, input pixel clock cam2_pclk low	0.5 * P ⁽²⁾		ns
ISP3	t _w (pclkH)	Typical pulse duration, input pixel clock cam2_pclk high	0.5 * P ⁽²⁾		ns
	t _{dc} (pclk)	Duty cycle error, input pixel clock cam2_pclk		0.5 * P ⁽²⁾ – 3.247	ns
	t _j (pclk)	Cycle jitter ⁽³⁾ , input pixel clock cam2_pclk		0.06 * P ⁽²⁾	ns
ISP4	t _{su} (vsV-pclkH)	Setup time, input vertical synchronization cam2_vs valid before input pixel clock cam2_pclk rising / falling edge	0.75		ns
ISP5	t _h (pclkH-vsV)	Hold time, input vertical synchronization cam2_vs valid after input pixel clock cam2_pclk rising / falling edge	0.96		ns
ISP6	t _{su} (hsV-pclkH)	Setup time, input horizontal synchronization cam2_hs valid before input pixel clock cam2_pclk rising / falling edge	0.75		ns
ISP7	t _h (pclkH-hsV)	Hold time, input horizontal synchronization cam2_hs valid after input pixel clock cam2_pclk rising / falling edge	0.96		ns
ISP8	t _{su} (dV-pclkH)	Setup time, input data cam2_d[n:0] ⁽⁵⁾ valid before input pixel clock cam2_pclk rising / falling edge	0.75		ns
ISP9	t _h (pclkH-dV)	Hold time, input data cam2_d[n:0] ⁽⁵⁾ valid after input pixel clock cam2_pclk rising / falling edge	0.96		ns
ISP10	t _{su} (wenV-pclkH)	Setup time, input write enable cam2_wen valid before input pixel clock cam2_pclk rising / falling edge	0.75		ns
ISP11	t _h (pclkH-wenV)	Hold time, input write enable cam2_wen valid after input pixel clock cam2_pclk rising / falling edge	0.96		ns

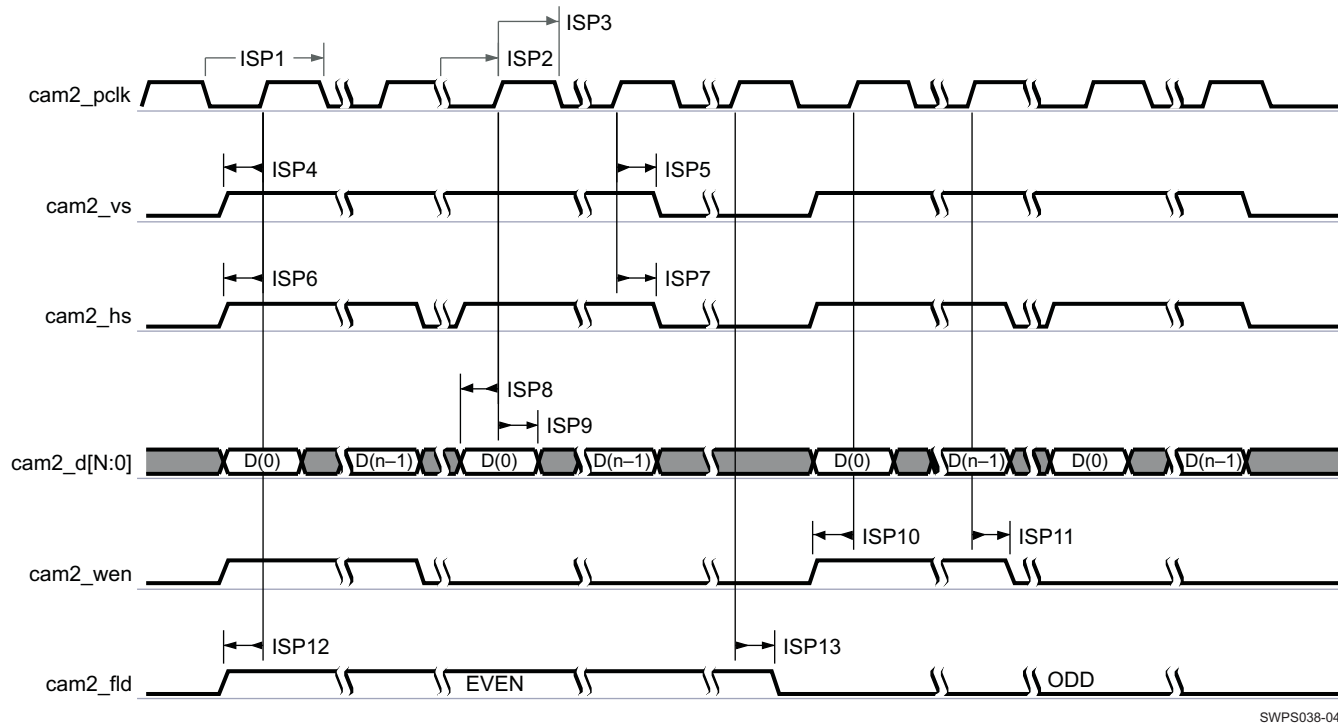

Table 5-34. CPI Timing Requirements—Video and Graphics Digitizer 1.8-V Mode⁽⁴⁾⁽⁶⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		UNIT
			MIN	MAX	
ISP12	$t_{su}(fldV-pclkH)$	Setup time, input field identification cam2_fld valid before input pixel clock cam2_pclk rising / falling edge	0.75		ns
ISP13	$t_h(pclkH-fldV)$	Hold time, input field identification cam2_fld valid after input pixel clock cam2_pclk rising / falling edge	0.96		ns

- (1) Related with the input maximum frequency supported by the ISP module in 8-bit mode with 8 to 16 data bits conversion bridge enabled.
- (2) P = cam2_pclk period in ns
- (3) Maximum cycle jitter supported by cam2_pclk input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) n = 15 (Data bus size is limited to 8 bits. So the bits configuration is either cam2_d[7:0] or cam2_d[8:15]). Lines not connected must be tied low. When the number of data lines is less than cam2_d[n:0], data lines can be connected to the upper or lower lines of cam2_d[n:0]. Lines not connected must be tied low.
For more information about video port mapping, see the OMAP4470 TRM.
- (6) See DM Operating Condition Addendum for OPP voltages.

**Figure 5-54. CPI—Video and Graphics Digitizer—1.8-V Progressive Mode⁽¹⁾⁽²⁾**

- (1) The polarity of cam2_pclk, cam2_fld, cam2_vs, and cam2_hs are software configurable. Optionally, the cam2_wen signal can be used as an external memory write-enable signal. For further details, see the OMAP4470 TRM.
- (2) N = 15 (Data bus size is limited to 8 bits. So the bits configuration is either cam2_d[7:0] or cam2_d[8:15]). Lines not connected must be tied low. When the number of data lines is less than cam2_d[N:0], data lines can be connected to the upper or lower lines of cam2_d[N:0]. Lines not connected must be tied low.
For more information about video port mapping, see the OMAP4470 TRM.

SWPS038-049

Figure 5-55. CPI—Video and Graphics Digitizer—1.8-V Interlaced Mode⁽¹⁾⁽²⁾

- (1) The polarity of cam2_pclk, cam2_fld, cam2_vs, and cam2_hs are software configurable. Optionally, the cam2_wen signal can be used as an external memory write-enable signal. For further details, see the OMAP4470 TRM.
- (2) N = 15 (Data bus size is limited to 8 bits. So the bits configuration is either cam2_d[7:0] or cam2_d[8:15]). Lines not connected must be tied low. When the number of data lines is less than cam2_d[N:0], data lines can be connected to the upper or lower lines of cam2_d[N:0]. Lines not connected must be tied low.
For more information about video port mapping, see the OMAP4470 TRM.

5.5.2 Display Subsystem Interface

NOTE

For more information, see the Display Subsystem chapter in the OMAP4470 TRM.

The display subsystem (DSS) provides the logic to display a video frame from the memory frame buffer on a liquid-crystal display (LCD) panel or a TV set. The modules integrated in the display subsystem are:

- Display controller (DISPC)
- Remote Frame Buffer Interface (RFBI)
- Display Serial Interface (DSI)
- High Definition Multimedia Interface (HDMI)

5.5.2.1 DSS—Display Controller (DISPC)

The DISPC interface consists of:

- 24-bit data bus
- Horizontal synchronization signal (HSYNC)
- Vertical synchronization signal (VSYNC)
- Data enable (DE)
- Pixel clock (PCLK)

This interface is functionally compliant to MIPI DPI standard revision 1.0 and delivers the parallel pixel / synchronization signals of the secondary LCD pipeline. DS11 output must be deactivating when DISPC2 port is used.

5.5.2.1.1 DSS—DISPC—Quad eXtended Graphics Array (QXGA) Application—SDR Mode

Table 5-36 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-56).

Table 5-35. DISPC Timing Conditions—QXGA SDR Mode⁽¹⁾⁽²⁾⁽⁴⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions⁽³⁾				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		2	cm
	Characteristic impedance	30	50	Ω

(1) IO settings: DS0 = 1.

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) Minimize the number of vias by layer transitions.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-36. DISPC Switching Characteristics—QXGA SDR Mode⁽⁴⁾

NO.	PARAMETER		OPP100, OPP119		UNIT
			MIN	MAX	
D1	$1 / t_{c(\text{pclk})}$	Frequency ⁽¹⁾ , output pixel clock disp2_pclk		170	MHz
D2	$t_{w(\text{pclkL})}$	Pulse duration, output pixel clock disp2_pclk low	0.5*P ⁽²⁾		ns
D3	$t_{w(\text{pclkH})}$	Pulse duration, output pixel clock disp2_pclk high	0.5*P ⁽²⁾		ns
	$t_{dc(\text{pclk})}$	Duty cycle error, output pixel clock disp2_pclk	-118	118	ps
	$t_{j(\text{pclk})}$	Jitter standard deviation ⁽³⁾ , output pixel clock disp2_pclk		39	ps
	$t_{R(\text{pclk})}$	Rise time, output pixel clock disp2_pclk		1066	ps
	$t_{F(\text{pclk})}$	Fall time, output pixel clock disp2_pclk		959	ps
D4	$t_{d(\text{pclkA-}v\text{syncV})}$	Delay time, output pixel clock disp2_pclk transition to output vertical synchronization disp2_vsync valid	-1832	332	ps
	$t_{R(v\text{sync})}$	Rise time, output vertical synchronization disp2_vsync		1066	ps
	$t_{F(v\text{sync})}$	Fall time, output vertical synchronization disp2_vsync		959	ps
D5	$t_{d(\text{pclkA-}h\text{syncV})}$	Delay time, output pixel clock disp2_pclk transition to output horizontal synchronization disp2_hsync valid	-1832	332	ps
	$t_{R(h\text{sync})}$	Rise time, output horizontal synchronization disp2_hsync		1066	ps
	$t_{F(h\text{sync})}$	Fall time, output horizontal synchronization disp2_hsync		959	ps
D6	$t_{d(\text{pclkA-dV})}$	Delay time, output pixel clock disp2_pclk transition to output data disp2_data[23:0] valid	-1832	332	ps
	$t_{R(d)}$	Rise time, output data disp2_data[23:0]		1066	ps
	$t_{F(d)}$	Fall time, output data disp2_data[23:0]		959	ps
D7	$t_{d(\text{pclkA-deV})}$	Delay time, output pixel clock disp2_pclk transition to output data enable disp2_de valid	-1832	332	ps
	$t_{R(de)}$	Rise time, output data enable disp2_de		1066	ps
	$t_{F(de)}$	Fall time, output data enable disp2_de		959	ps
D8	$t_{d(\text{pclkA-fidV})}$	Delay time, output pixel clock disp2_pclk transition to output field ID disp2_fid valid	-1832	332	ps
	$t_{R(fid)}$	Rise time, output field ID disp2_fid		1066	ps
	$t_{F(fid)}$	Fall time, output field ID disp2_fid		959	ps

(1) Related to the output disp2_clk⁽⁴⁾ maximum frequency programmable.

(2) P = output disp2_pclk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) See DM Operating Condition Addendum for CORE OPP voltages.

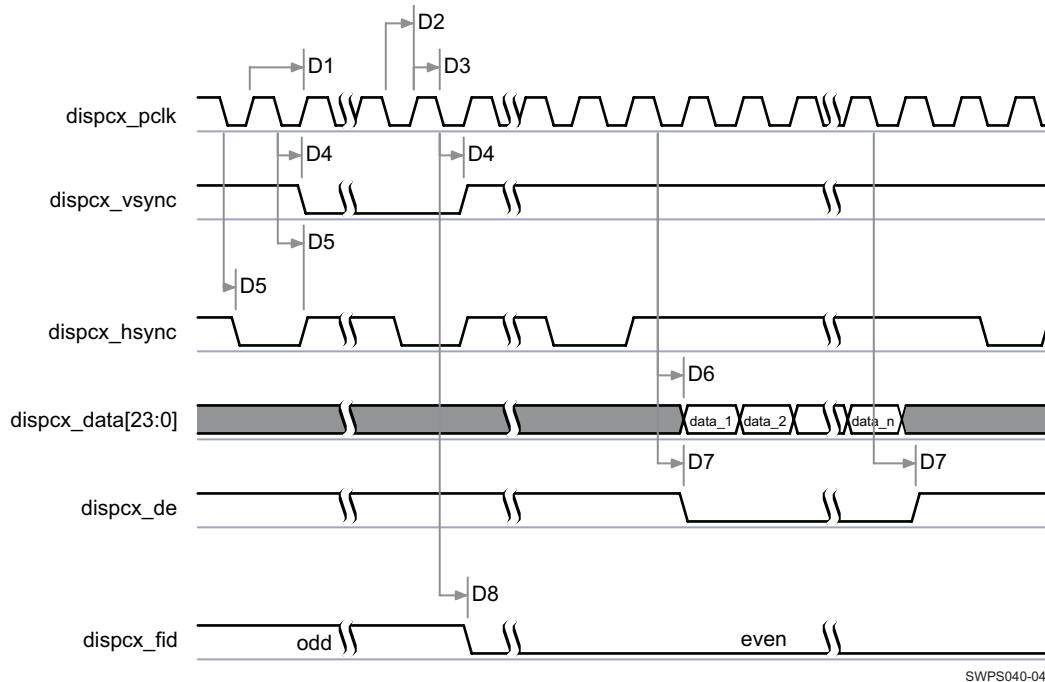

Figure 5-56. DSS—DISPC—QXGA SDR Application⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) The configuration of assertion of the data can be programmed on the falling edge or rising edge of the pixel clock.
- (2) In progressive mode, dispcx_fid signal is set to 0. In interlaced mode, the dispcx_fid signal toggles on the back edge of the vertical pulse.
- (3) The polarity and the pulse width of dispcx_hsync and dispcx_vsync are programmable; see the DSS chapter in the OMAP4470 TRM.
- (4) The dispcx_pclk⁽⁵⁾ frequency can be configured, see DSS chapter in the OMAP4470 TRM.
- (5) In dispcx_clk, x = 2
- (6) For more information, see the DISPC chapter in the OMAP4470 TRM.

5.5.2.2 DSS—Remote Frame Buffer Interface (RFBI) Applications

5.5.2.2.1 DSS—Remote Frame Buffer Interface (RFBI)—MIPI DBI2.0—LCD Panel

NOTE

For more information, see the Remote Frame Buffer Interface chapter in the OMAP4470 TRM.

The remote frame buffer interface (RFBI) module is part of the display subsystem that provides the logic to display a picture from the memory frame buffer (SDRAM or SRAM) on a liquid-crystal display (LCD) panel.

Table 5-38 and Table 5-39 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-57 through Figure 5-59).

Table 5-37. DSS—RFBI Timing Conditions—LCD Panel⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time		15	ns
t _F	Input signal fall time		15	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		30	pF
	Trace length		20	cm
	Characteristic impedance	20	50	Ω

(1) IO settings: DS0 = 0.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 30% to 70% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-38. DSS—RFBI Timing Requirements—LCD Panel

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DR0	t _{su(dataV-rfbi_reH)}	Setup time, rfbi_data[n:0] ⁽²⁾ valid to rfbi_re high	20.0		20.0		ns

- (3) For more information, see the Display Subsystem chapter in the OMAP4470 TRM.

5.5.2.2.2 DSS—Remote Frame Buffer Interface (RFBI)—Pico DLP

The Remote Frame Buffer Interface (RFBI) module can provide also the necessary control signals and data to interface to the Pico DLP driver of the Pico DLP panel.

Table 5-42 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-60).

Table 5-41. DSS—RFBI Timing Conditions—Pico DLP⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		10	cm
	Characteristic impedance	30	50	Ω

(1) IO settings: DS0 = 0.

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDDS. For more information on the corresponding OMAP4 VDDS power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-42. DSS—RFBI Switching Characteristics—Pico DLP⁽¹⁰⁾⁽¹¹⁾⁽¹²⁾

	$t_{d(rfbi_weH-rfbi_csxH)}$	Delay time, rfb_i_we high to rfb_i_csx ⁽⁸⁾ high	F ⁽⁶⁾		F ⁽⁶⁾		ns
	$t_{d(dataV)}$	Output rfb_i_data[n:0] ⁽⁹⁾ valid	G ⁽⁷⁾		G ⁽⁷⁾		ns
	$t_{sk(Skew)}$	Skew between output write enable falling rfb_i_we and output rfb_i_data[n:0] ⁽⁹⁾ high or low	11.7		11.7		ns
	$t_{R(rfbi_we)}$	Rise time, rfb_i_we		4		4	ns
	$t_{F(rfbi_we)}$	Fall time, rfb_i_we		4		4	ns
	$t_{R(rfbi_a0)}$	Rise time, rfb_i_a0		4		4	ns
	$t_{F(rfbi_a0)}$	Fall time, rfb_i_a0		4		4	ns
	$t_{R(rfbi_csx)}$	Rise time, rfb_i_csx ⁽⁸⁾		4		4	ns
	$t_{F(rfbi_csx)}$	Fall time, rfb_i_csx ⁽⁸⁾		4		4	ns
	$t_{R(rfbi_da)}$	Rise time, rfb_i_data[n:0] ⁽⁹⁾		4		4	ns
	$t_{F(rfbi_da)}$	Fall time, rfb_i_data[n:0] ⁽⁹⁾		4		4	ns
	CsOnTime	CS signal assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	0 ⁽¹³⁾				ns
	CsOffTime	CS signal de-assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	40 ⁽¹³⁾				ns
	WeOnTime	WE signal assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	0 ⁽¹³⁾				ns

Table 5-42. DSS—RFBI Switching Characteristics—Pico DLP⁽¹⁰⁾⁽¹¹⁾⁽¹²⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	WeOffTime	WE signal de-assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	20 ⁽¹³⁾				ns
	ReOnTime	RE signal assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	-				ns
	ReOffTime	RE signal de-assertion time from Start Access Time – RFBI_ONOFF_TIME1 Register	-				ns
	WeCycleTime	Write cycle time – RFBI_CYCLE_TIME1_Register	40 ⁽¹³⁾				ns
	ReCycleTime	Read cycle time – RFBI_CYCLE_TIME1_Register	-				ns
	CsPulseWidth	CS pulse width – RFBI_CYCLE_TIME1_Register	0 ⁽¹³⁾				ns

(1) $A = (WeCycleTime - WeOffTime) * (TimeParaGranularity + 1) * L3CLK$

(2) $B = (WeOffTime - WeOnTime) * (TimeParaGranularity + 1) * L3CLK$

(3) $C = (WEOnTime) * (TimeParaGranularity + 1) * L3CLK$

(4) $D = (WeCycleTime + CsPulseWidth - WeOffTime) * (TimeParaGranularity + 1) * L3CLK$

(5) $E = (WeOnTime - CsOnTime) * (TimeParaGranularity + 1) * L3CLK$

(6) $F = (CsOffTime - WeOffTime) * (TimeParaGranularity + 1) * L3CLK$

(7) $G = (WeCycleTime) * (TimeParaGranularity + 1) * L3CLK$

(8) In RFBI_nCSx, x is equal to 0.

(9) rfb_data[n:0], n up to 15.

(10) See DM Operating Condition Addendum for CORE OPP voltages.

(11) At OPP100, L3 clock is 200 MHz and at OPP50, L3 clock is 100 MHz.

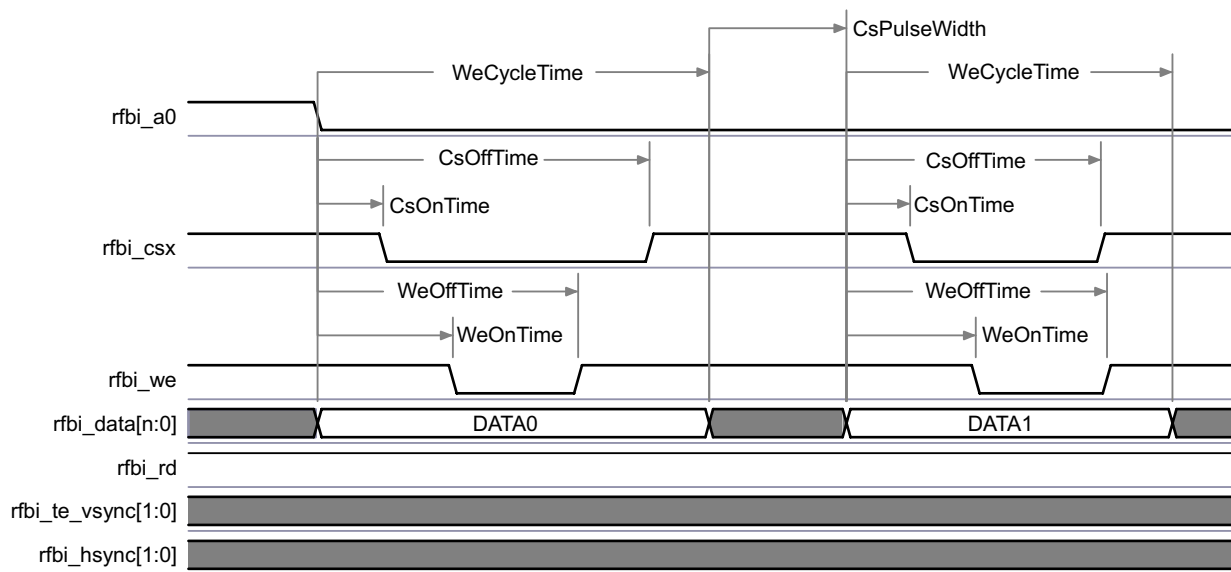

(12) rfb_wr must be at 25 MHz.

(13) These values are calculated by the following formula: RFBI Register (Values) * L3 Clock (ns), with L3 clock = 200 MHz. See [Table 5-43](#) for the RFBI registers values.

Table 5-43. DSS—RFBI Register Configuration—Pico DLP⁽¹⁾

DESCRIPTION	REGISTER AND BIT FIELD	BIT	VALUES
CS signal assertion time from Start Access Time	RFBI_ONOFF_TIME & CSONTIME	[3:0]	0b0000
CS signal de-assertion time from Start Access Time	RFBI_ONOFF_TIME & CSOFFTIME	[9:4]	0b001000: 8 cycles
WE signal assertion time from Start Access Time	RFBI_ONOFF_TIME & WEONTIME	[13:10]	0b0000
WE signal de-assertion time from Start Access Time	RFBI_ONOFF_TIME & WEOFFTIME	[19:14]	0b000100: 4 cycles
Write cycle time	RFBI_CYCLE_TIME & WECYCLETIME	[5:0]	0b001000: 8 cycles
CS pulse width	RFBI_CYCLE_TIME & CSPULSEWIDTH	[17:12]	0b0000
From Start Access Time to CLK rising edge used for the first data capture	RFBI_CYCLE_TIME & ACCESSTIME	[27:22]	0b0000
Latencies multiplied by 2.	RFBI_CONFIG & TIMEGRANULARITY	[4]	0b0: x2 latency disable

(1) For more information on the RFBI registers, see the Display Subsystem / Remote Frame Buffer Interface section of the OMAP4470 TRM.

SWPS045-012

Figure 5-60. DSS—RFBI—Command / Data Write—Pico DLP⁽¹⁾⁽²⁾⁽³⁾

- (1) In rfb_i_csx, x is equal to 0.
- (2) In rfb_i_data[n:0], n up to 15
- (3) For more information, see the Display Subsystem chapter in the OMAP4470 TRM.

5.5.2.3 Display Serial Interface (DSI1)

NOTE

For more information, see the MIPI Display Serial chapter in the OMAP4470 TRM.

Display Serial Interface is a MIPI D-PHY compliant interface connecting a display module and a mobile phone application. This interface is made of three differential lanes, each of them being configurable for carrying data or clock. The polarity of each wire of a lane is also configurable.

5.5.2.3.1 DSS—DSI—High-Speed Mode

NOTE

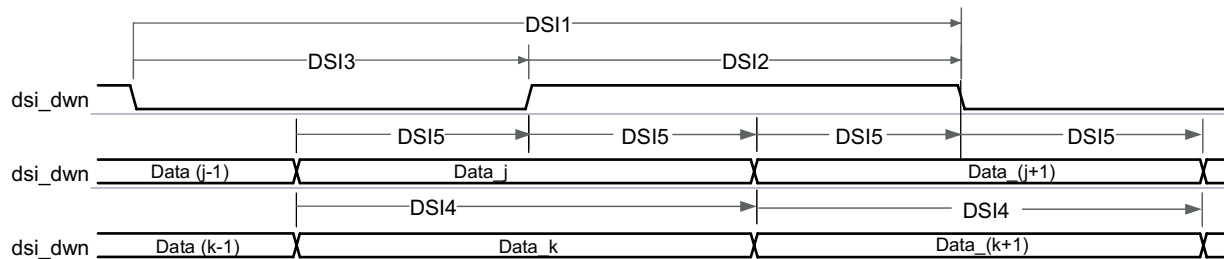

If the skew degradation due to the total interconnect (from the transmitter ball to the receiver ball) between the clock and the data lanes is less than ± 192 ps (instead of ± 222 ps in the MIPI D-PHY specification) then 900 Mbps (450 MHz) per data lane is achievable with 4 data lanes at OPP100 and OPP50 operating points.

Table 5-44 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-61).

Table 5-44. DSS—DSI Switching Characteristics—High-Speed Mode⁽²⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DSI1_1 and DSI1_2 – Up To 3 Data Lanes							
DSI1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , output clock	40	450	40	450	MHz
DSI1_1 – 4 Data Lanes							
DSI1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , output clock	40	412	40	412	MHz
DSI1_1 and DSI1_2 – Up To 3 Data Lanes Or 4 Data Lanes							
DSI2, DSI3	$t_{UI[\text{NOM}]}$	Instantaneous unit interval	$t_{c(\text{clk})} / 2$		$t_{c(\text{clk})} / 2$		ns
DSI4	$t_{UI(\text{INST,MIN})}$	Instantaneous bit duration	$t_{UI[\text{NOM}]} - t_{j(\text{UI}(\text{INST,MIN}))}$		$t_{UI[\text{NOM}]} - t_{j(\text{UI}(\text{INST,MIN}))}$		ns
	$t_{j(\text{UI}(\text{INST,MIN}))}$	Total jitter / uncertainty on instantaneous unit interval including clock jitter, DSI PHY transmitter jitter and duty cycle degradation		$2.5\% * t_{UI[\text{NOM}]} + 0.05$		$2.5\% * t_{UI[\text{NOM}]} + 0.05$	ns
DSI5	$t_{d(\text{clkAE-dv})}$	Delay time, clock active edge to next data valid or delay time, previous data valid to clock active edge	$50\% * t_{UI(\text{INST,MIN})} - t_{\text{SKEW}}$	$50\% * t_{UI(\text{INST,MIN})} + t_{\text{SKEW}}$	$50\% * t_{UI(\text{INST,MIN})} - t_{\text{SKEW}}$	$50\% * t_{UI(\text{INST,MIN})} + t_{\text{SKEW}}$	ns
	t_{SKEW}	Lane to lane skew introduced by DSI PHY transmitter		$15\% * t_{UI(\text{INST,MIN})}$		$15\% * t_{UI(\text{INST,MIN})}$	ns
	$t_{R(\text{DXi-DYi})}$	Rise time, dsim_dxn, dsim_dyn ⁽³⁾ , (20% to 80%)	0.150	$0.3 * t_{UI(\text{INST,MIN})}$	0.150	$0.3 * t_{UI(\text{INST,MIN})}$	ns
	$t_{F(\text{DXi-DYi})}$	Fall time, dsim_dxn, dsim_dyn ⁽³⁾ , (20% to 80%)	0.150	$0.3 * t_{UI(\text{INST,MIN})}$	0.150	$0.3 * t_{UI(\text{INST,MIN})}$	ns

- (1) Related to the maximum frequency supported by the DSI module.
- (2) The timing requirements are assured up to the minimum instantaneous bit duration.
- (3) In $dsim_dxn$ and $dsim_dyn$, m is equal to 1 or 2, and n is equal to 0, 1, 2, 3, or 4 for DSI1_1 and n is equal to 0, 1, or 2 for DSI1_2.
- (4) No specific capacitive load is needed in DSI high-speed mode. The PCB interconnect must be 50-Ω transmission line on DSI $dsim_dx[2;0]$ and DSI $dsim_dy[2;0]$. DSI $dsim_dx[2;0]$ and DSI $dsim_dy[2;0]$ lines must be well matched. See Chapter 7 of the MIPI D-PHY standard v1.0 for complete specification of the Interconnect.
- (5) See DM Operating Condition Addendum for CORE OPP voltages.
- (6) For more information on the PCB requirements, see [Section A.4.3, MIPI D-PHY PCB Guidelines in OMAP4](#).

SWPS040-051

Figure 5-61. DSS—DSI—High-Speed Mode⁽¹⁾⁽²⁾⁽³⁾

- (1) In $dsim_dwn$, w is equal to x or y , m is equal to 1 or 2, and n is equal to 0, 1, 2, 3, or 4 for DSI1_1 and n is equal to 0, 1, or 2 for DSI1_2.
- (2) The use of each $dsim_dwn$ ⁽¹⁾ lane (clock or data) is software programmable with the DSI_COMPLEXIO_CFG1 register. For more information, see the Display Subsystem chapter in the OMAP4470 TRM.
- (3) The polarity of each $dsim_dwn$ ⁽¹⁾ lane is software programmable with the DSI_COMPLEXIO_CFG1 register. For more information, see the Display Subsystem chapter in the OMAP4470 TRM.

5.5.2.3.2 DSS—DSI—Low-Power and Ultralow-Power Modes

[Table 5-46](#) assumes testing over the recommended operating conditions and electrical characteristic conditions below (see [Figure 5-62](#)).

Table 5-45. DSS—DSI Timing Conditions—Low-Power and Ultralow-Power Modes⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Output Condition				
C_{LOAD}	Output load capacitance	0	60 ⁽¹⁾	pF

- (1) The maximum capacitive load for the DSI low-power mode is equal to 60 pF. See Chapter 8 of the MIPI D-PHY standard v1.0 for complete specification on the electrical characteristics. The PCB interconnect must be 50-Ω transmission line on DSI $dsim_dx[n;0]$ ⁽²⁾ and DSI $dsim_dy[n;0]$ ⁽²⁾. DSI $dsim_dx[n;0]$ ⁽²⁾ and DSI $dsim_dy[n;0]$ ⁽²⁾ lines must be well matched. See Chapter 7 of the MIPI D-PHY standard v1.0 for complete specification of the interconnect.
- (2) In $dsim_dxn$ and $dsim_dyn$, m is equal to 1 or 2, and n is equal to 0, 1, 2, 3, or 4 for DSI1_1 and n is equal to 0, 1, or 2 for DSI1_2.
- (3) For more information on the PCB requirements, see [Section A.4.3, MIPI D-PHY PCB Guidelines in OMAP4](#).

Table 5-46. DSI Switching Characteristics—Low-Power and Ultralow-Power Modes⁽⁵⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DSI6	$t_{w(XORclk)}$	Pulse width of the LP exclusive-OR clock ⁽¹⁾	40		40		ns
		First LP exclusive-OR clock ⁽¹⁾ pulse after Stop state or last pulse before Stop state					
		All other pulses	20		20		ns
	$t_{c(XORclk)}$	Period of the LP exclusive-OR clock ⁽¹⁾	90		90		ns
	$t_{REOT(LP)}$	Rise time, $dsim_dxn$, $dsim_dyn$ ⁽⁴⁾		35		35	ns

Table 5-46. DSI Switching Characteristics—Low-Power and Ultralow-Power Modes⁽⁵⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$t_{R(LP)}$	Rise time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ for a 5-pF C_L load	2.6	25	2.6	25	ns
		Rise time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ for a 20-pF C_L load	3.1	25	3.1	25	
		Rise time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ for a 70-pF C_L load	5.1	25	5.1	25	
	$t_{F(LP)}$	Fall time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ or a 5-pF C_L load	2.6	25	2.6	25	ns
		Fall time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ or a 20-pF C_L load	3.1	25	3.1	25	
		Fall time, dsim_dxn, dsim_dyn ⁽²⁾⁽³⁾ or a 70-pF C_L load	5.1	25	5.1	25	

- (1) Low-power and ultralow-power communication modes are asynchronous, data is Spaced-One-Hot bit encoded, data transfer clock is recovered by means of an XOR between dsim_dxn⁽²⁾ and dsim_dyn⁽²⁾. For more information about the LP exclusive-OR clock, see Table 19 of MIPI D-PHY standard v1.0.
- (2) In dsim_dxn and dsim_dyn, m is equal to 1 or 2, and n is equal to 0, 1, 2, 3, or 4 for DSI1_1 and n is equal to 0, 1, or 2 for DSI1_2.
- (3) The output rise and fall times are measured between 15% and 85% of vdds_dsi.
- (4) Rise or fall time between 30% and 85% of the low-power (LP) levels. This is applicable only when high-speed (HS) burst is ending, that is, the lines go from a high-speed state 0 or a high-speed state 1 to a low-power stop state (the differential drive is stopped). Since there is extra load on the lines (the receiver in low-power mode has a common mode capacitor of up to 60 pF), this is slower. See the Low-Power Receiver Mode (LPRX) section of Table 3-8 for the Low-Power V_{IL}/V_{OL} input threshold values.
- (5) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-052

Figure 5-62. DSS—DSI—Low-Power and Ultralow-Power Modes⁽¹⁾⁽²⁾

- (1) In dsim_dwn, w is equal to x or y, m is equal to 1 or 2, and n is equal to 0, 1, 2, 3, or 4 for DSI1_1 and n is equal to 0, 1, or 2 for DSI1_2.
- (2) Low-Power and Ultralow-Power communication modes are asynchronous, data is Spaced-One-Hot bit encoded, data transfer clock is recovered by means of an XOR between dsim_dxn⁽¹⁾ and dsim_dyn⁽¹⁾.

5.5.2.4 High Definition Multimedia Interface (HDMI)

NOTE

More information on HDMI is not available in the public domain.

5.6 Serial Communications Interfaces

5.6.1 Multichannel Buffered Serial Port (McBSP)

NOTE

For more information, see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Functional Description section of the OMAP4470 TRM.

The multichannel buffered serial port (McBSP) provides a full-duplex direct serial interface between the OMAP chip and other devices in a system, such as other application chips, codecs. It can accommodate a wide range of peripherals and clocked frame oriented protocols (I2S™, PCM, TDM) due to its high level of versatility.

McBSP supports two types of data transfer at the system level:

- The full-cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later).
- The half-cycle mode, for which one-half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one-half clock period later). A new data is generated only every clock period, which secures the required hold time.

The interface clock (clkX/CLKR) activation edge (data/frame sync capture and generation) has to be configured accordingly with the external peripheral (activation edge capability) and the type of data transfer required at the system level.

Depending on the number of pins, McBSP supports either:

- 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
- 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.

5.6.1.1 McBSP1, McBSP2, and McBSP3 Set#1

5.6.1.1.1 McBSP1, McBSP2, and McBSP3 Set#1—I2S/PCM

Table 5-48 through Table 5-51 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-63 and Figure 5-64).

Table 5-47. McBSP1, 2 Timing Conditions—I2S/PCM⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	400	6500	ps
t _F	Input signal fall time	400	6500	ps
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		9	cm
	Characteristic impedance	30	55	Ω

(1) IO settings: MB[1:0] = 10 and LB0 = 0.

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.1.1.1 McBSP1 and McBSP2—I2S/PCM Full and Half Cycle—Master Mode—24 MHz

Table 5-48. McBSP1, 2 Timing Requirements—I2S/PCM—Master Mode⁽¹⁾⁽³⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	1 / t _c (clks)	Frequency, input abe_clks ⁽⁵⁾ clock		24.576 ⁽⁵⁾		12.288 ⁽⁵⁾	MHz

Table 5-48. McBSP1, 2 Timing Requirements—I2S/PCM—Master Mode⁽¹⁾⁽³⁾⁽⁶⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$t_{w(\text{clksL})}$	Typical pulse duration, input abe_clks low	$0.5 * P^{(4)}$		$0.5 * P^{(4)}$		ns
	$t_{w(\text{clksH})}$	Typical pulse duration, output abe_clks high	$0.5 * P^{(4)}$		$0.5 * P^{(4)}$		ns
	$t_{dc(\text{clks})}$	Duty cycle error, input abe_clks	$-0.05 * P^{(4)} + 610$	$0.05 * P^{(4)} - 610$	$-0.05 * P^{(4)} + 610$	$0.05 * P^{(4)} - 610$	ps
	$t_j(\text{clks})$	Jitter peak to peak, input abe_clks		300		300	ps
BM5	$t_{su}(\text{drV-clkAE})$	Setup time, abe_mcbsp_x_dr valid before abe_mcbsp_x_clk ⁽²⁾ active edge	4.6		10.5		ns
BM6	$t_h(\text{clkAE-drV})$	Hold time, abe_mcbsp_x_dr valid after abe_mcbsp_x_clk ⁽²⁾ active edge	0.7		0.6		ns

- (1) The timings apply to all configurations regardless of abe_mcbsp_x_clk polarity and which clock edges are used to drive output data and capture input data.
- (2) abe_mcbsp_x_clk corresponds to either abe_mcbsp_x_clkx or abe_mcbsp_x_clk; abe_mcbsp_x_clk is available in 6-pin mode only.
- (3) In abe_mcbsp_x, x is equal to 1 or 2.
- (4) P = abe_clks input clock period in ns
- (5) The McPDM interface can be used at the same time with one or more McBSP (interfaces 1, 2, or 3). In this case, abe_clks clock is shared, that means identical, between McPDM and McBSP. As a consequence, the minimum clock frequency between McPDM and McBSP, input jitter, and duty cycle must be considered between both interfaces.
- (6) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-49. McBSP1, 2 Switching Characteristics—I2S/PCM—Master Mode⁽⁴⁾⁽⁷⁾⁽⁹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM0	$1 / t_c(\text{clk})$	Frequency ⁽¹⁾ , output abe_mcbsp_x_clk ⁽⁵⁾ clock		24.576 ⁽⁸⁾		12.288 ⁽⁸⁾	MHz
BM1	$t_{w(\text{clkL})}$	Typical pulse duration, output abe_mcbsp_x_clk ⁽⁵⁾ low	$0.5 * P^{(2)}$		$0.5 * P^{(2)}$		ns
BM2	$t_{w(\text{clkH})}$	Typical pulse duration, output abe_mcbsp_x_clk ⁽⁵⁾ high	$0.5 * P^{(2)}$		$0.5 * P^{(2)}$		ns
	$t_{dc(\text{clk})}$	Duty cycle error, output abe_mcbsp_x_clk ⁽⁵⁾	-2035	2035	-4069	4069	ps
	$t_j(\text{clk})$	Jitter standard deviation ⁽³⁾ , output abe_mcbsp_x_clk ⁽⁵⁾		65		65	ps
	$t_R(\text{clk})$	Rise time, output abe_mcbsp_x_clk ⁽⁵⁾	400	6500	400	6500	ps
	$t_F(\text{clk})$	Fall time, output abe_mcbsp_x_clk ⁽⁵⁾	400	6500	400	6500	ps
BM3	$t_d(\text{clkAE-fsV})$	Delay time, output abe_mcbsp_x_clk ⁽⁵⁾ active edge to output abe_mcbsp_x_fs ⁽⁶⁾ valid	0.9	11.0	1.0	22.6	ns
BM4	$t_d(\text{clkxAE-dxV})$	Delay time, output abe_mcbsp_x_clkx active edge to output abe_mcbsp_x_dx valid	0.9	11.0	1.0	22.6	ns
	$t_R(\text{fs})$	Rise time, output abe_mcbsp_x_fs ⁽⁶⁾	400	6500	400	6500	ps
	$t_F(\text{fs})$	Fall time, output abe_mcbsp_x_fs ⁽⁶⁾	400	6500	400	6500	ps
	$t_R(\text{dx})$	Rise time, output abe_mcbsp_x_dx	400	6500	400	6500	ps
	$t_F(\text{dx})$	Fall time, output abe_mcbsp_x_dx	400	6500	400	6500	ps

- (1) Related to the output abe_mcbsp_x_clkx / abe_mcbsp_x_clk maximum and minimum frequency programmable in McBSP module by setting the configuration register SRGR1_REG[7..0].
For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (2) P = abe_mcbsp_x_clkx / abe_mcbsp_x_clk output clk period in ns.
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) The timings apply to all configurations regardless of abe_mcbsp_x_clk polarity and which clock edges are used to drive output data and capture input data.
- (5) abe_mcbsp_x_clk corresponds to either abe_mcbsp_x_clkx or abe_mcbsp_x_clk; abe_mcbsp_x_clk is available in 6-pin mode only.
- (6) abe_mcbsp_x_fs corresponds to either abe_mcbsp_x_fsx or abe_mcbsp_x_fsr; abe_mcbsp_x_fsr is available in 6-pin mode only.
- (7) In abe_mcbsp_x, x is equal to 1 or 2.

- (8) This McBSP1, 2 output clock frequency is based on an output ABE DPLL configured at 196.608 MHz.
For more information regarding the registers configuration, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_ABE Description section of the OMAP4470 TRM.
- (9) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.1.1.1.2 McBSP1 and McBSP2—I2S/PCM Full and Half Cycle—Slave Mode—12 MHz

Table 5-50. McBSP1, 2 Timing Requirements—I2S/PCM—Slave Mode⁽⁴⁾⁽⁵⁾⁽⁸⁾⁽⁹⁾

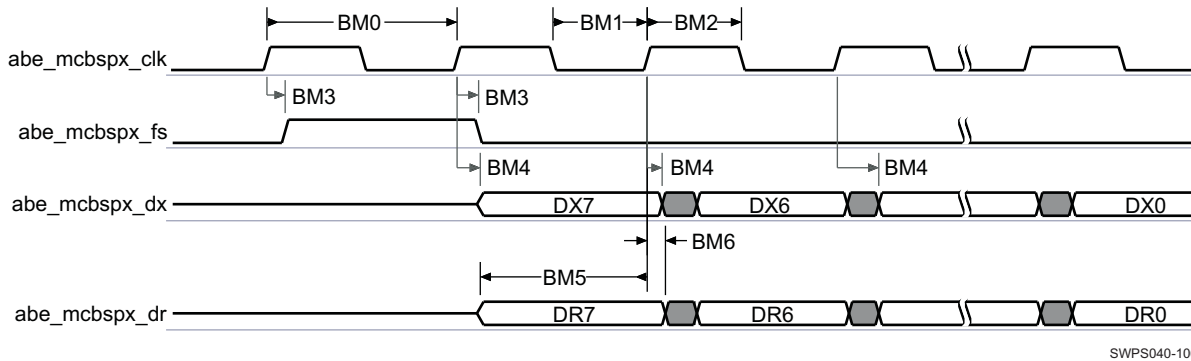

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

	$t_{j(\text{clk})}$	Cycle jitter ⁽³⁾ , abe_mcbsp_x_clk ⁽⁶⁾		1221		2000	ps
BS3	$t_{su(\text{fsV-clkAE})}$	Setup time, abe_mcbsp_x_fs ⁽⁷⁾ valid before abe_mcbsp_x_clk ⁽⁶⁾ active edge	14.3		30.4		ns
BS4	$t_{h(\text{clkAE-fsV})}$	Hold time, abe_mcbsp_x_fs ⁽⁷⁾ valid after abe_mcbsp_x_clk ⁽⁶⁾ active edge	14.3		30.4		ns
BS6	$t_{su(\text{drV-clkAE})}$	Setup time, abe_mcbsp_x_dr valid before abe_mcbsp_x_clk ⁽⁶⁾ active edge	14.3		30.4		ns
BS7	$t_{h(\text{clkAE-drV})}$	Hold time, abe_mcbsp_x_dr valid after abe_mcbsp_x_clk ⁽⁶⁾ active edge	14.3		30.4		ns

- (1) Related to the input maximum frequency supported by the McBSP module.
- (2) P = abe_mcbsp_x_clkx / abe_mcbsp_x_clk period in ns
- (3) Maximum cycle jitter supported by abe_mcbsp_x_clkx / abe_mcbsp_x_clk input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) The timings apply to all configurations regardless of abe_mcbsp_x_clk polarity and which clock edges are used to drive output data and capture input data.
- (6) abe_mcbsp_x_clk corresponds to either abe_mcbsp_x_clkx or abe_mcbsp_x_clk; abe_mcbsp_x_clk is available in 6-pin mode only.
- (7) abe_mcbsp_x_fs corresponds to either abe_mcbsp_x_fsx or abe_mcbsp_x_fsr; abe_mcbsp_x_fsr is available in 6-pin mode only.
- (8) In abe_mcbsp_x, x is equal to 1 or 2.
- (9) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-51. McBSP1, 2 Switching Characteristics—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS5	$t_{d(\text{clkxAE-dxV})}$	Delay time, input abe_mcbsp_x_clkx active edge to output abe_mcbsp_x_dx valid	-16.4	20.3	-34.0	36.1	ns
	$t_{R(\text{dx})}$	Rise time, output abe_mcbsp_x_dx	400	6500	400	6500	ps
	$t_{F(\text{dx})}$	Fall time, output abe_mcbsp_x_dx	400	6500	400	6500	ps

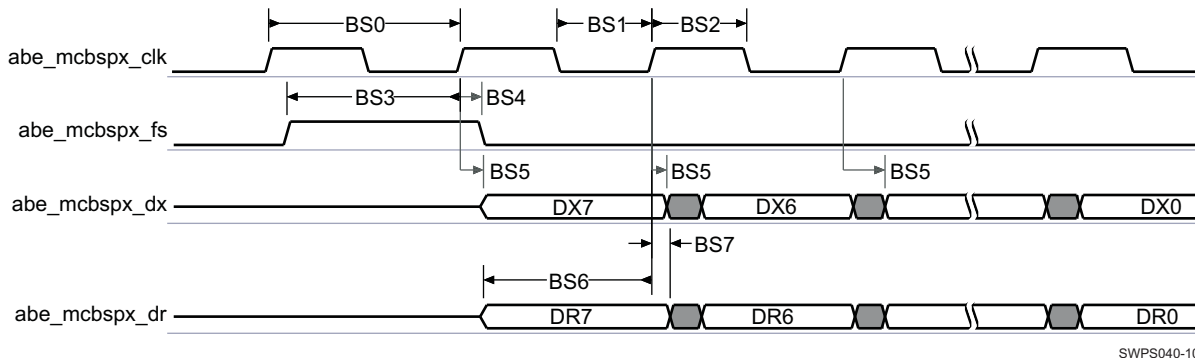

- (1) The timings apply to all configurations regardless of `abe_mcbssp_x` polarity and which clock edges are used to drive output data and capture input data.
- (2) In `abe_mcbssp_x`, `x` is equal to 1 or 2.
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-106

Figure 5-63. McBSP1, 2—I2S/PCM—Master Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) `abe_mcbssp_clk` corresponds to either `abe_mcbssp_clkx` or `abe_mcbssp_clkr`; `abe_mcbssp_fs` corresponds to either `abe_mcbssp_fsx` or `abe_mcbssp_fsr`.
McBSP in 6-pin mode: `dx` and `dr` as data pins; `clkx`, `clkr`, `fsx`, and `fsr` as control pins.
McBSP in 4-pin mode: `dx` and `dr` as data pins; `clkx` and `fsx` pins as control pins. The `clkx` and `fsx` pins are internally looped back, via software configuration, respectively to the `clkr` and `fsr` internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of `abe_mcbssp_clk` (rising or falling) on which `abe_mcbssp_dx` data is latched and `abe_mcbssp_dr` data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In `abe_mcbssp_x`, `x` is equal to 1 or 2.

SWPS040-107

Figure 5-64. McBSP1, 2—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) `abe_mcbssp_clk` corresponds to either `abe_mcbssp_clkx` or `abe_mcbssp_clkr`; `abe_mcbssp_fs` corresponds to either `abe_mcbssp_fsx` or `abe_mcbssp_fsr`.
McBSP in 6-pin mode: `dx` and `dr` as data pins; `clkx`, `clkr`, `fsx`, and `fsr` as control pins. McBSP in 4-pin mode: `dx` and `dr` as data pins; `clkx` and `fsx` pins as control pins. The `clkx` and `fsx` pins are internally looped back, via software configuration, respectively to the `clkr` and `fsr` internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of `abe_mcbssp_clk` (rising or falling) on which `abe_mcbssp_dx` data is latched and `abe_mcbssp_dr` data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In `abe_mcbssp_x`, `x` is equal to 1 or 2.

5.6.1.1.2 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle

5.6.1.1.2.1 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—6MHz, 40-pF Load Capacitance

Table 5-53 through Table 5-56 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-65 and Figure 5-66).

Table 5-52. McBSP1, McBSP2, and McBSP3 Set#1 Timing Conditions—TDM / Half-Cycle⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1000	11100	ps
t_F	Input signal fall time	1000	11100	ps
PCB Conditions				
	Number of external peripherals		1	
	Far end load		40	pF
	Trace length		9	cm
	Characteristic impedance	20	60	Ω

- (1) IO settings: MB[1:0] = 10 and LB0 = 0 McBSP3 Set#1 means the following balls: AG25, AF25, AE25, AF26. For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.1.2.1.1 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—Master Mode

Table 5-53. McBSP1, McBSP2, and McBSP3 Set#1 Timing Requirements—TDM / Half-Cycle—Master Mode⁽¹⁾⁽³⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{c(\text{clks})}$	Frequency, input abe_clks ⁽⁵⁾ clock		6.144 ⁽⁵⁾		3.072 ⁽⁵⁾	MHz
	$t_{w(\text{clksL})}$	Typical pulse duration, input abe_clks low	0.5 * P ⁽⁴⁾		0.5 * P ⁽⁴⁾		ns
	$t_{w(\text{clksH})}$	Typical pulse duration, output abe_clks high	0.5 * P ⁽⁴⁾		0.5 * P ⁽⁴⁾		ns
	$t_{dc(\text{clks})}$	Duty cycle error, input abe_clks	-0.05 * P ⁽⁴⁾ + 610	0.05 * P ⁽⁴⁾ - 610	-0.05 * P ⁽⁴⁾ + 610	0.05 * P ⁽⁴⁾ - 610	ps
	$t_j(\text{clks})$	Jitter peak to peak, input abe_clks		300		300	ps
BM5	$t_{su(\text{drV-clkAE})}$	Setup time, abe_mcbssp_x_dr valid before abe_mcbssp_x_clk ⁽²⁾ active edge	22.6		48.6		ns
BM6	$t_{h(\text{clkAE-drV})}$	Hold time, abe_mcbssp_x_dr valid after abe_mcbssp_x_clk ⁽²⁾ active edge	22.3		48.4		ns

- (1) The timings apply to all configurations regardless of abe_mcbssp_x_clk polarity and which clock edges are used to drive output data and capture input data.
- (2) abe_mcbssp_x_clk corresponds to either abe_mcbssp_x_clkx or abe_mcbssp_x_clk; abe_mcbssp_x_clk is available in 6-pin mode only.
- (3) In abe_mcbssp_x, x is equal to 1 or, 2 or, 3 Set#1 (Balls: AG25, AF25, AE25, AF26).
- (4) P = abe_clks input clock period in ns
- (5) The McPDM interface can be used at the same time with one or more McBSP (interface 1, 2, or 3). In this case, abe_clks clock is shared, that means identical, between McPDM and McBSP. As a consequence, the minimum clock frequency between McPDM and McBSP, input jitter, and duty cycle must be considered between both interfaces.
- (6) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-54. McBSP1, McBSP2, and McBSP3 Set#1 Switching Characteristics—TDM / Half-Cycle—Master Mode⁽⁴⁾⁽⁷⁾⁽⁹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

BM1	$t_{w(\text{clkL})}$	Typical pulse duration, output abe_mcbssp_clk ⁽⁵⁾ low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
BM2	$t_{w(\text{clkH})}$	Typical pulse duration, output abe_mcbssp_clk ⁽⁵⁾ high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc(\text{clk})}$	Duty cycle error, output abe_mcbssp_clk ⁽⁵⁾	-8138	8138	-16276	16276	ps
	$t_{j(\text{clk})}$	Jitter standard deviation ⁽³⁾ , output abe_mcbssp_clk ⁽⁵⁾		65		65	ps
	$t_{R(\text{clk})}$	Rise time, output abe_mcbssp_clk ⁽⁵⁾	1000	11100	1000	11100	ps
	$t_{F(\text{clk})}$	Fall time, output abe_mcbssp_clk ⁽⁵⁾	1000	11100	1000	11100	ps
BM3	$t_{d(\text{clkAE-fsV})}$	Delay time, output abe_mcbssp_clk ⁽⁵⁾ active edge to output abe_mcbssp_fs ⁽⁶⁾ valid	-30.9	46.4	-63.5	94.4	ns
BM4	$t_{d(\text{clkxAE-dxV})}$	Delay time, output abe_mcbssp_clk active edge to output abe_mcbssp_dx valid	-30.9	46.4	-63.5	94.4	ns
	$t_{R(\text{fs})}$	Rise time, output abe_mcbssp_fs ⁽⁶⁾	1000	11100	1000	11100	ps
	$t_{F(\text{fs})}$	Fall time, output abe_mcbssp_fs ⁽⁶⁾	1000	11100	1000	11100	ps
	$t_{R(\text{dx})}$	Rise time, output abe_mcbssp_dx	1000	11100	1000	11100	ps
	$t_{F(\text{dx})}$	Fall time, output abe_mcbssp_dx	1000	11100	1000	11100	ps

(1) Related to the output abe_mcbssp_clkx / abe_mcbssp_clkr maximum and minimum frequency programmable in McBSP module by setting the configuration register SRGR1_REG[7..0].
For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

(2) P = abe_mcbssp_clkx / abe_mcbssp_clkr output clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) The timings apply to all configurations regardless of abe_mcbssp_clk polarity and which clock edges are used to drive output data and capture input data.

(5) abe_mcbssp_clk corresponds to either abe_mcbssp_clkx or abe_mcbssp_clkr; abe_mcbssp_clkr is available in 6-pin mode only.

(6) abe_mcbssp_fs corresponds to either abe_mcbssp_fsx or abe_mcbssp_fsr; abe_mcbssp_fsr is available in 6-pin mode only.

(7) In abe_mcbssp_x, x is equal to 1, 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

(8) This McBSP1, 2 output clock frequency is based on an output ABE DPLL configured at 196.608 MHz.

For more information regarding the registers configuration, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_ABE Description section of the OMAP4470 TRM.

(9) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.1.1.2.1.2 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—Slave Mode

Table 5-55. McBSP1, 2, and 3 Set#1 Timing Requirements—TDM / Half-Cycle—Slave Mode⁽⁴⁾⁽⁵⁾⁽⁸⁾⁽⁹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

BS3	$t_{su(\text{fsV-clkAE})}$	Setup time, abe_mcbssp_fs ⁽⁷⁾ valid before abe_mcbssp_clk ⁽⁶⁾ active edge	26.5		55.8		ns
BS4	$t_{h(\text{clkAE-fsV})}$	Hold time, abe_mcbssp_fs ⁽⁷⁾ valid after abe_mcbssp_clk ⁽⁶⁾ active edge	26.5		55.8		ns

Table 5-55. McBSP1, 2, and 3 Set#1 Timing Requirements—TDM / Half-Cycle—Slave Mode⁽⁴⁾⁽⁵⁾⁽⁸⁾⁽⁹⁾ (continued)

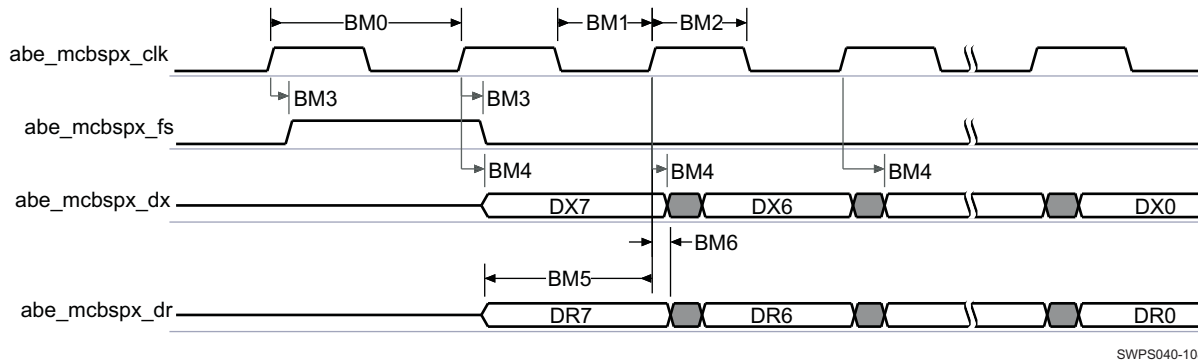

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS6	$t_{su}(drV-clkAE)$	Setup time, <code>abe_mcbssp_x_dr</code> valid before <code>abe_mcbssp_clk⁽⁶⁾</code> active edge	26.5		55.8		ns
BS7	$t_h(clkAE-drV)$	Hold time, <code>abe_mcbssp_x_dr</code> valid after <code>abe_mcbssp_clk⁽⁶⁾</code> active edge	26.5		55.8		ns

- (1) Related to the input maximum frequency supported by the McBSP module.
- (2) $P = \text{abe_mcbssp_clkx} / \text{abe_mcbssp_clk}$ period in ns
- (3) Maximum cycle jitter supported by `abe_mcbssp_clkx` / `abe_mcbssp_clk` input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) The timings apply to all configurations regardless of `abe_mcbssp_clk` polarity and which clock edges are used to drive output data and capture input data.
- (6) `abe_mcbssp_clk` corresponds to either `abe_mcbssp_clkx` or `abe_mcbssp_clk`; `abe_mcbssp_clk` is available in 6-pin mode only.
- (7) `abe_mcbssp_fs` corresponds to either `abe_mcbssp_fsx` or `abe_mcbssp_fsr`; `abe_mcbssp_fsr` is available in 6-pin mode only.
- (8) In `abe_mcbssp_x`, x is equal to 1, 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).
- (9) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-56. McBSP1, 2, and 3 Set#1 Switching Characteristics—TDM / Half-Cycle—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS5	$t_{d}(clkxAE-dxV)$	Delay time, input <code>abe_mcbssp_clkx</code> active edge to output <code>abe_mcbssp_dx</code> valid	-25.2	33.6	-57.7	74.3	ns
	$t_{R}(dx)$	Rise time, output <code>abe_mcbssp_dx</code>	1000	11100	1000	11100	ps
	$t_{F}(dx)$	Fall time, output <code>abe_mcbssp_dx</code>	1000	11100	1000	11100	ps

- (1) The timings apply to all configurations regardless of `abe_mcbssp_clk` polarity and which clock edges are used to drive output data and capture input data.
- (2) In `abe_mcbssp_x`, x is equal to 1, 2, or 3 Set #1 (Balls: AG25, AF25, AE25, AF26).
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-108

Figure 5-65. McBSP1, 2, and 3 Set#1—TDM / Half-Cycle—Master Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) abe_mcbssp_clk corresponds to either abe_mcbssp_clkx or abe_mcbssp_clkr; abe_mcbssp_fs corresponds to either abe_mcbssp_fsx or abe_mcbssp_fsr.
McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of abe_mcbssp_clk (rising or falling) on which abe_mcbssp_dx data is latched and abe_mcbssp_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In abe_mcbssp, x is equal to 1, 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

SWPS040-109

Figure 5-66. McBSP1, 2, and 3 Set#1—TDM / Half-Cycle—Slave Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) abe_mcbssp_clk corresponds to either abe_mcbssp_clkx or abe_mcbssp_clkr; abe_mcbssp_fs corresponds to either abe_mcbssp_fsx or abe_mcbssp_fsr.
McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of abe_mcbssp_clk (rising or falling) on which abe_mcbssp_dx data is latched and abe_mcbssp_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In abe_mcbssp, x is equal to 1, 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

5.6.1.1.2.2 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—12MHz, 5-pF Load Capacitance

Table 5-58 through Table 5-61 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-67 and Figure 5-68).

Table 5-57. McBSP1, McBSP2, and McBSP3 Set#1 Timing Conditions—TDM / Half-Cycle⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	600	6500	ps
t_F	Input signal fall time	600	6500	ps
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		9	cm
	Characteristic impedance	20	60	Ω

- (1) IO settings: MB[1:0] = 10 and LB0 = 0 McBSP3 Set#1 means the following balls: AG25, AF25, AE25, AF26. For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.1.2.2.1 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—Master Mode

Table 5-58. McBSP1, McBSP2, and McBSP3 Set#1 Timing Requirements—TDM / Half-Cycle—Master Mode⁽¹⁾⁽³⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{C(\text{clks})}$	Frequency, input abe_clks ⁽⁵⁾ clock		12.288 ⁽⁵⁾		6.144 ⁽⁵⁾	MHz
	$t_{W(\text{clksL})}$	Typical pulse duration, input abe_clks low	0.5 * P ⁽⁴⁾		0.5 * P ⁽⁴⁾		ns
	$t_{W(\text{clksH})}$	Typical pulse duration, output abe_clks high	0.5 * P ⁽⁴⁾		0.5 * P ⁽⁴⁾		ns
	$t_{dc(\text{clks})}$	Duty cycle error, input abe_clks	-0.05 * P ⁽⁴⁾ + 610	0.05 * P ⁽⁴⁾ - 610	-0.05 * P ⁽⁴⁾ + 610	0.05 * P ⁽⁴⁾ - 610	ps
	$t_j(\text{clks})$	Jitter peak to peak, input abe_clks		300		300	ps
BM5	$t_{su(\text{drV-clkAE})}$	Setup time, abe_mcbssp_dr valid before abe_mcbssp_clk ⁽²⁾ active edge	11.3		24.3		ns
BM6	$t_h(\text{clkAE-drV})$	Hold time, abe_mcbssp_dr valid after abe_mcbssp_clk ⁽²⁾ active edge	-2.4		-2.4		ns

- (1) The timings apply to all configurations regardless of abe_mcbssp_clk polarity and which clock edges are used to drive output data and capture input data.
- (2) abe_mcbssp_clk corresponds to either abe_mcbssp_clkx or abe_mcbssp_clk; abe_mcbssp_clk is available in 6-pin mode only.
- (3) In abe_mcbssp, x is equal to 1, or 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).
- (4) P = abe_clks input clock period in ns
- (5) The McPDM interface can be used at the same time with one or more McBSP (interface 1, 2, or 3). In this case, abe_clks clock is shared, that means identical, between McPDM and McBSP. As a consequence, the minimum clock frequency between McPDM and McBSP, input jitter, and duty cycle must be considered between both interfaces.
- (6) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-59. McBSP1, McBSP2, and McBSP3 Set#1 Switching Characteristics—TDM / Half-Cycle—Master Mode⁽⁴⁾⁽⁷⁾⁽⁹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

	$t_{j(\text{clk})}$	Jitter standard deviation ⁽³⁾ , output abe_mcbssp_clk ⁽⁵⁾		65		65	ps
	$t_{R(\text{clk})}$	Rise time, output abe_mcbssp_clk ⁽⁵⁾	600	6500	600	6500	ps
	$t_{F(\text{clk})}$	Fall time, output abe_mcbssp_clk ⁽⁵⁾	600	6500	600	6500	ps
BM3	$t_{d(\text{clkAE-fsV})}$	Delay time, output abe_mcbssp_clk ⁽⁵⁾ active edge to output abe_mcbssp_fs ⁽⁶⁾ valid	-14.6	22.4	-30.9	46.4	ns
BM4	$t_{d(\text{clkxAE-dxV})}$	Delay time, output abe_mcbssp_clk active edge to output abe_mcbssp_dx valid	-14.6	22.4	-30.9	46.4	ns
	$t_{R(\text{fs})}$	Rise time, output abe_mcbssp_fs ⁽⁶⁾	600	6500	600	6500	ps
	$t_{F(\text{fs})}$	Fall time, output abe_mcbssp_fs ⁽⁶⁾	600	6500	600	6500	ps
	$t_{R(\text{dx})}$	Rise time, output abe_mcbssp_dx	600	6500	600	6500	ps
	$t_{F(\text{dx})}$	Fall time, output abe_mcbssp_dx	600	6500	600	6500	ps

(1) Related to the output abe_mcbssp_clkx / abe_mcbssp_clkr maximum and minimum frequency programmable in McBSP module by setting the configuration register SRGR1_REG[7..0].

For more information regarding the registers configuration see Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

(2) P = abe_mcbssp_clkx / abe_mcbssp_clkr output clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) The timings apply to all configurations regardless of abe_mcbssp_clk polarity and which clock edges are used to drive output data and capture input data.

(5) abe_mcbssp_clk corresponds to either abe_mcbssp_clkx or abe_mcbssp_clkr; abe_mcbssp_clkr is available in 6-pin mode only.

(6) abe_mcbssp_fs corresponds to either abe_mcbssp_fsx or abe_mcbssp_fsr; abe_mcbssp_fsr is available in 6-pin mode only.

(7) In abe_mcbssp, x is equal to 1 or, 2 or, 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

(8) This McBSP1, 2 output clock frequency is based on an output ABE DPLL configured at 196.608 MHz.

For more information regarding the registers configuration, see Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_ABE Description section of the OMAP4470 TRM.

(9) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.1.1.2.2.2 McBSP1, McBSP2, and McBSP3 Set#1—TDM / Half-Cycle—Slave Mode

Table 5-60. McBSP1, McBSP2, and McBSP3 Set#1 Timing Requirements—TDM / Half-Cycle—Slave Mode⁽⁵⁾⁽⁸⁾⁽⁹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT

BS4	$t_{h(\text{clkAE-fsV})}$	Hold time, abe_mcbssp_fs ⁽⁷⁾ valid after abe_mcbssp_clk ⁽⁶⁾ active edge	11.9		26.5		ns

Table 5-60. McBSP1, McBSP2, and McBSP3 Set#1 Timing Requirements—TDM / Half-Cycle—Slave Mode⁽⁵⁾⁽⁸⁾⁽⁹⁾ (continued)

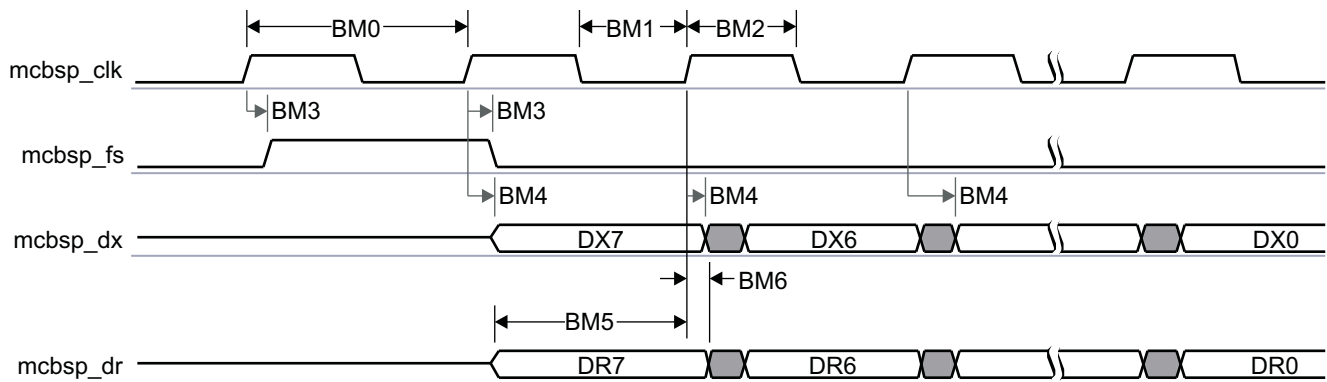

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS6	$t_{su}(drV-clkAE)$	Setup time, <code>abe_mcbbsp_x_dr</code> valid before <code>abe_mcbbsp_clk⁽⁶⁾</code> active edge	9.4		21.6		ns
BS7	$t_h(clkAE-drV)$	Hold time, <code>abe_mcbbsp_x_dr</code> valid after <code>abe_mcbbsp_clk⁽⁶⁾</code> active edge	11.9		26.5		ns

- (1) Related to the input maximum frequency supported by the McBSP module.
- (2) $P = \text{abe_mcbbsp_clkx} / \text{abe_mcbbsp_clk}$ period in ns
- (3) Maximum cycle jitter supported by `abe_mcbbsp_clkx` / `abe_mcbbsp_clk` input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) The timings apply to all configurations regardless of `abe_mcbbsp_clk` polarity and which clock edges are used to drive output data and capture input data.
- (6) `abe_mcbbsp_clk` corresponds to either `abe_mcbbsp_clkx` or `abe_mcbbsp_clk`; `abe_mcbbsp_clk` is available in 6-pin mode only.
- (7) `abe_mcbbsp_fs` corresponds to either `abe_mcbbsp_fsx` or `abe_mcbbsp_fsr`; `abe_mcbbsp_fsr` is available in 6-pin mode only.
- (8) In `abe_mcbbsp_x`, x is equal to 1, or 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).
- (9) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-61. McBSP1, 2, and 3 Set#1 Switching Characteristics—TDM / Half-Cycle—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS5	$t_{d}(clkxAE-dxV)$	Delay time, input <code>abe_mcbbsp_clkx</code> active edge to output <code>abe_mcbbsp_dx</code> valid	-7.1	20.3	-23.4	43.0	ns
	$t_{R}(dx)$	Rise time, output <code>abe_mcbbsp_dx</code>	600	6500	600	6500	ps
	$t_{F}(dx)$	Fall time, output <code>abe_mcbbsp_dx</code>	600	6500	600	6500	ps

- (1) The timings apply to all configurations regardless of `mcbbsp_clk` polarity and which clock edges are used to drive output data and capture input data.
- (2) In `abe_mcbbsp_x`, x is equal to 1, or 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

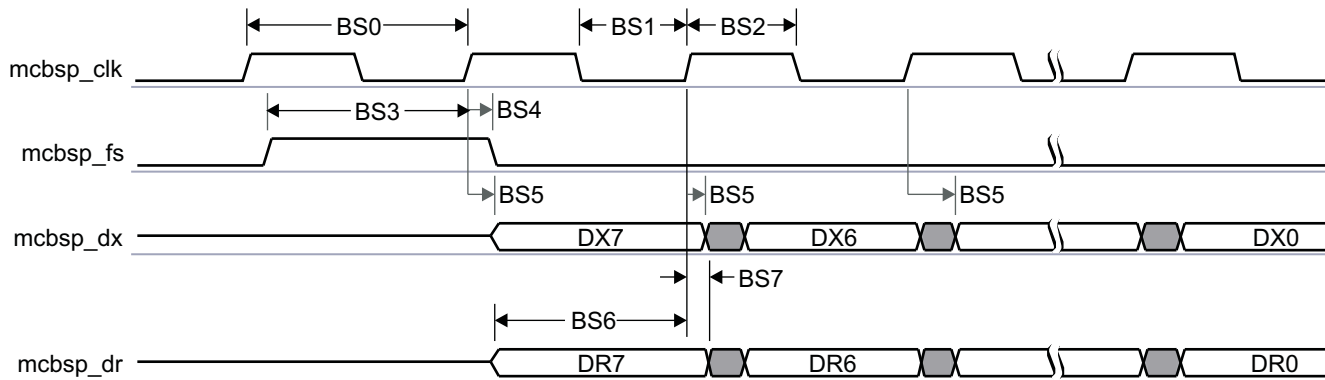

SWPS040-151

Figure 5-67. McBSP1, 2, and 3 Set#1—TDM / Half-Cycle—Master Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) `abe_mcbbsp_clk` corresponds to either `abe_mcbbsp_clkx` or `abe_mcbbsp_clk`; `abe_mcbbsp_fs` corresponds to either `abe_mcbbsp_fsx` or `abe_mcbbsp_fsr`.
McBSP in 6-pin mode: `dx` and `dr` as data pins; `clkx`, `clkr`, `fsx`, and `fsr` as control pins.
McBSP in 4-pin mode: `dx` and `dr` as data pins; `clkx` and `fsx` pins as control pins. The `clkx` and `fsx` pins are internally looped back, via software configuration, respectively to the `clkr` and `fsr` internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of `abe_mcbbsp_clk` (rising or falling) on which `abe_mcbbsp_dx` data is latched and `abe_mcbbsp_dr` data is sampled is software configurable.

- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In `abe_mcbbsp_x`, `x` is equal to 1, or 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

SWPS040-152

Figure 5-68. McBSP1, 2, and 3 Set#1—TDM / Half-Cycle—Slave Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾⁽⁶⁾

- (1) `abe_mcbbsp_x_clk` corresponds to either `abe_mcbbsp_x_clkx` or `abe_mcbbsp_x_clkr`; `abe_mcbbsp_x_fs` corresponds to either `abe_mcbbsp_x_fsx` or `abe_mcbbsp_x_fsr`.
McBSP in 6-pin mode: `dx` and `dr` as data pins; `clkx`, `clkr`, `fsx`, and `fsr` as control pins.
McBSP in 4-pin mode: `dx` and `dr` as data pins; `clkx` and `fsx` pins as control pins. The `clkx` and `fsx` pins are internally looped back, via software configuration, respectively to the `clkr` and `fsr` internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of `abe_mcbbsp_x_clk` (rising or falling) on which `abe_mcbbsp_x_dx` data is latched and `abe_mcbbsp_x_dr` data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.
- (6) In `abe_mcbbsp_x`, `x` is equal to 1, or 2, or 3 Set#1 (Balls: AG25, AF25, AE25, AF26).

5.6.1.2 McBSP3—I2S/PCM

Table 5-63 through Table 5-66 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-69 and Figure 5-70).

Table 5-62. McBSP3 Timing Conditions—I2S/PCM⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	400	6500	ps
t_F	Input signal fall time	400	6500	ps
PCB Conditions				
Bottom Balls: AG25 / AF25 / AE25 / AF26				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length, point-to-point interconnect		9	cm
	Characteristic impedance	30	55	Ω
Bottom Balls: AH17 / AE16 / AF16 / AG16				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length, point-to-point interconnect		9	cm

Table 5-62. McBSP3 Timing Conditions—I2S/PCM⁽¹⁾⁽²⁾⁽³⁾ (continued)

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
	Characteristic impedance	30	45	Ω

(1) IO settings: MB[1:0] = 10 and LB0 = 0.

For more information, see:

- For balls AG25 / AF25 / AE25 / AF26, Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM
- For balls AH17 / AE16 / AF16 / AG16, Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.2.1 McBSP3—I2S/PCM Full and Half Cycle—Master Mode—24 MHz

Table 5-63. McBSP3 Timing Requirements—I2S/PCM—Master Mode⁽¹⁾⁽⁵⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{C(\text{clks})}$	Frequency, input abe_clks ⁽⁴⁾ clock		24.576 ⁽⁴⁾		12.288 ⁽⁴⁾	MHz
	$t_{w(\text{clksL})}$	Typical pulse duration, input abe_clks low	0.5 * P ⁽³⁾		0.5 * P ⁽³⁾		ns
	$t_{w(\text{clksH})}$	Typical pulse duration, output abe_clks high	0.5 * P ⁽³⁾		0.5 * P ⁽³⁾		ns
	$t_{dc(\text{clks})}$	Duty cycle error, input abe_clks	$-0.05 * P^{(3)} + 610$	$0.05 * P^{(3)} - 610$	$-0.05 * P^{(3)} + 610$	$0.05 * P^{(3)} - 610$	ps
	$t_{j(\text{clks})}$	Jitter peak to peak, input abe_clks		300		300	ps
For balls: AH17 / AE16 / AF16 / AG16 (abe_mcbasp3_dr / abe_mcbasp3_dx / abe_mcbasp3_clkx / abe_mcbasp3_fsx)—Multiplexing mode 2							
BM5	$t_{su(\text{drV-clkAE})}$	Setup time, abe_mcbasp3_dr valid before abe_mcbasp3_clk ⁽²⁾ active edge	5.6		11.5		ns
BM6	$t_{h(\text{clkAE-drV})}$	Hold time, abe_mcbasp3_dr valid after abe_mcbasp3_clk ⁽²⁾ active edge	0.8		0.7		ns
For balls: AG25 / AF25 / AE25 / AF26 (abe_mcbasp3_dr / abe_mcbasp3_dx / abe_mcbasp3_clkx / abe_mcbasp3_fsx)—Multiplexing mode 1							
BM5	$t_{su(\text{drV-clkAE})}$	Setup time, abe_mcbasp3_dr valid before abe_mcbasp3_clk ⁽²⁾ active edge	4.6		10.5		ns
BM6	$t_{h(\text{clkAE-drV})}$	Hold time, abe_mcbasp3_dr valid after abe_mcbasp3_clk ⁽²⁾ active edge	0.7		0.6		ns

(1) The timings apply to all configurations regardless of abe_mcbasp3_clk polarity and which clock edges are used to drive output data and capture input data.

(2) abe_mcbasp3_clk corresponds to either abe_mcbasp3_clkx or abe_mcbasp3_clkr; abe_mcbasp3_clkr is available in 6-pin mode only.

(3) P = abe_clks input clock period in ns

(4) The McPDM interface can be used at the same time with one or more McBSP (interface 1, 2, or 3). In this case, abe_clks clock is shared, that means identical, between McPDM and McBSP. As a consequence, the minimum clock frequency between McPDM and McBSP, input jitter, and duty cycle must be considered between both interfaces.

(5) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-64. McBSP3 Switching Characteristics—I2S/PCM—Master Mode⁽⁴⁾⁽⁸⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT

(1) Related to the input maximum frequency supported by the McBSP module.

(2) P = abe_mcbasp3_clkx / abe_mcbasp3_clk period in ns

(3) Maximum cycle jitter supported by abe_mcbasp3_clkx / abe_mcbasp3_clk input clock.

(4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.

(5) The timings apply to all configurations regardless of abe_mcbasp3_clk polarity and which clock edges are used to drive output data and capture input data.

(6) abe_mcbasp3_clk corresponds to either abe_mcbasp3_clkx or abe_mcbasp3_clkr; abe_mcbasp3_clkr is available in 6-pin mode only.

(7) abe_mcbasp3_fs corresponds to either abe_mcbasp3_fsx or abe_mcbasp3_fsr; abe_mcbasp3_fsr is available in 6-pin mode only.

(8) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-66. McBSP3 Switching Characteristics—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾

NO.	PARAMETER	OPP100, OPP119		OPP50		UNIT
		MIN	MAX	MIN	MAX	
For balls: AE16 / AF16 / AG16 (abe_mcbasp3_dx / abe_mcbasp3_clkx / abe_mcbasp3_fsx)—Multiplexing mode 2						
BS5	$t_{d(\text{clkxAE-dxV})}$	Delay time, input abe_mcbasp3_clkx active edge to output abe_mcbasp3_dx valid		-16.4	22.3	ns
	$t_{R(\text{dx})}$	Rise time, output abe_mcbasp3_dx		400	6500	ps
	$t_{F(\text{dx})}$	Fall time, output abe_mcbasp3_dx		400	6500	ps
For balls: AF25 / AE25 / AF26 (abe_mcbasp3_dx / abe_mcbasp3_clkx / abe_mcbasp3_fsx)—Multiplexing mode 1						
BS5	$t_{d(\text{clkxAE-dxV})}$	Delay time, input abe_mcbasp3_clkx active edge to output abe_mcbasp3_dx valid		-16.4	20.3	ns
	$t_{R(\text{dx})}$	Rise time, output abe_mcbasp3_dx		400	6500	ps
	$t_{F(\text{dx})}$	Fall time, output abe_mcbasp3_dx		400	6500	ps

(1) The timings apply to all configurations regardless of abe_mcbasp3_clk polarity and which clock edges are used to drive output data and capture input data.

(2) See DM Operating Condition Addendum for CORE OPP voltages.

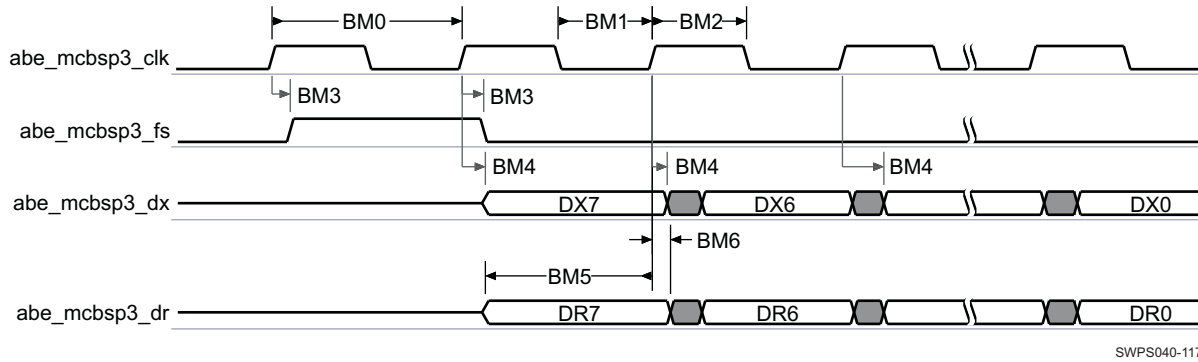

Figure 5-69. McBSP3—I2S/PCM—Master Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

- (1) abe_mcbbsp3_clk corresponds to either abe_mcbbsp3_clkx or abe_mcbbsp3_clkr; abe_mcbbsp3_fs corresponds to either abe_mcbbsp3_fsx or abe_mcbbsp3_fsr.
McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of abe_mcbbsp3_clk (rising or falling) on which abe_mcbbsp3_dx data is latched and abe_mcbbsp3_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

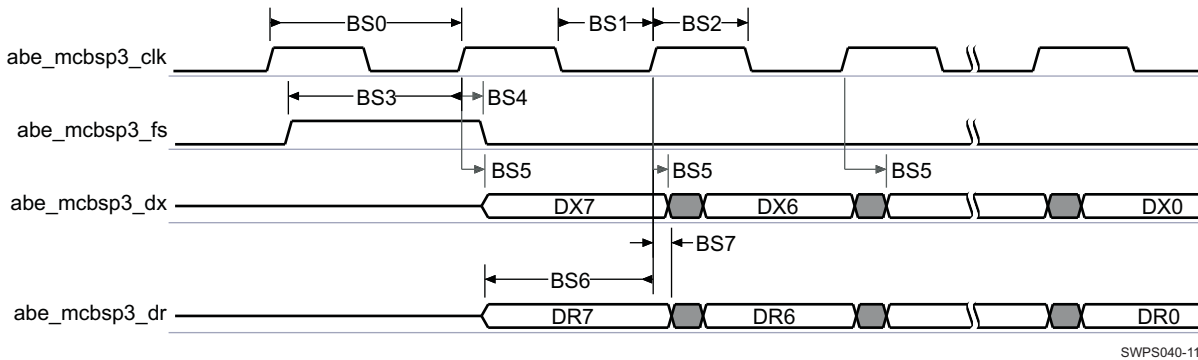

Figure 5-70. McBSP3—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

- (1) mcbbsp3_clk corresponds to either mcbbsp3_clkx or mcbbsp3_clkr; mcbbsp3_fs corresponds to either mcbbsp3_fsx or mcbbsp3_fsr.
McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of mcbbsp3_clk (rising or falling) on which mcbbsp3_dx data is latched and mcbbsp3_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

5.6.1.3 McBSP4—I2S/PCM

5.6.1.3.1 McBSP4—I2S/PCM—Full Cycle—48-MHz Master and 24-MHz Slave

Table 5-68 through Table 5-71 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-71 and Figure 5-72).

Table 5-67. McBSP4 Timing Conditions—I2S/PCM⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	400	4000	ps
t_F	Input signal fall time	400	4000	ps
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length, point-to-point interconnect		6	cm
	Characteristic impedance	30	45	Ω

(1) IO settings: MB[1:0] = 10 and LB0 = 0

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.3.1.1 McBSP4—I2S/PCM—Full Cycle—48-MHz Master Mode

Table 5-68. McBSP4 Timing Requirements—I2S/PCM—Master Mode⁽¹⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM5	$t_{su}(drV-clkAE)$	Setup time, mcbbsp4_dr valid before mcbbsp4_clk ⁽²⁾ active edge	3.8		6.6		ns
BM6	$t_{h}(clkAE-drV)$	Hold time, mcbbsp4_dr valid after mcbbsp4_clk ⁽²⁾ active edge	0.3		0.3		ns

(1) The timings apply to all configurations regardless of mcbbsp4_clk polarity and which clock edges are used to drive output data and capture input data.

(2) mcbbsp4_clk corresponds to either mcbbsp4_clkx or mcbbsp4_clkr; mcbbsp4_clkr is available in 6-pin mode only.

(3) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-69. McBSP4 Switching Characteristics—I2S/PCM—Master Mode⁽⁴⁾⁽⁸⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM0	$1 / t_{c}(clk)$	Frequency ⁽¹⁾ , output mcbbsp4_clk ⁽⁵⁾ clock		48 ⁽⁷⁾		24 ⁽⁷⁾	MHz
BM1	$t_{w}(clkL)$	Typical pulse duration, output mcbbsp4_clk ⁽⁵⁾ low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
BM2	$t_{w}(clkH)$	Typical pulse duration, output mcbbsp4_clk ⁽⁵⁾ high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc}(clk)$	Duty cycle error, output mcbbsp4_clk ⁽⁵⁾	-1042	1042	-2083	2083	ps
	$t_j(clk)$	Jitter standard deviation ⁽³⁾ , output mcbbsp4_clk ⁽⁵⁾		65		65	ps
	$t_R(clk)$	Rise time, output mcbbsp4_clk ⁽⁵⁾	400	4000	400	4000	ps
	$t_F(clk)$	Fall time, output mcbbsp4_clk ⁽⁵⁾	400	4000	400	4000	ps

Table 5-69. McBSP4 Switching Characteristics—I2S/PCM—Master Mode⁽⁴⁾⁽⁸⁾ (continued)

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM3	$t_{d(\text{clkAE-fsV})}$	Delay time, output mcbbsp4_clk ⁽⁵⁾ active edge to output mcbbsp4_fs ⁽⁶⁾ valid	0.6	9.4	0.9	19.5	ns
BM4	$t_{d(\text{clkxAE-dxV})}$	Delay time, output mcbbsp4_clkx active edge to output mcbbsp4_dx valid	0.6	9.4	0.9	19.5	ns
	$t_{R(\text{fs})}$	Rise time, output mcbbsp4_fs ⁽⁶⁾	400	4000	400	4000	ps
	$t_{F(\text{fs})}$	Fall time, output mcbbsp4_fs ⁽⁶⁾	400	4000	400	4000	ps
	$t_{R(\text{dx})}$	Rise time, output mcbbsp4_dx	400	4000	400	4000	ps
	$t_{F(\text{dx})}$	Fall time, output mcbbsp4_dx	400	4000	400	4000	ps

(1) Related to the output mcbbsp4_clkx / mcbbsp4_clkr maximum and minimum frequency programmable in McBSP module by setting the configuration register SRGR1_REG[7..0].

For more information regarding the registers configuration see Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) / McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

(2) $P = \text{mcbbsp4_clkx} / \text{mcbbsp4_clkr}$ output clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) The timings apply to all configurations regardless of mcbbsp4_clk polarity and which clock edges are used to drive output data and capture input data.

(5) mcbbsp4_clk corresponds to either mcbbsp4_clkx or mcbbsp4_clkr; mcbbsp4_clkr is available in 6-pin mode only.

(6) mcbbsp4_fs corresponds to either mcbbsp4_fsx or mcbbsp4_fsr; mcbbsp4_fsr is available in 6-pin mode only.

(7) This McBSP4 output clock frequency is based on an output PER DPLL configured at 96 MHz.

For more information regarding the registers configuration, see Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_PER Description section of the OMAP4470 TRM.

(8) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.1.3.1.2 McBSP4—I2S/PCM—Full Cycle—24-MHz Slave Mode

Table 5-70. McBSP4 Timing Requirements—I2S/PCM—Slave Mode⁽⁴⁾⁽⁵⁾⁽⁸⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS0	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , mcbbsp4_clk ⁽⁶⁾		24		12	MHz
BS1	$t_{w(\text{clkL})}$	Typical pulse duration, mcbbsp4_clk ⁽⁶⁾ low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
BS2	$t_{w(\text{clkH})}$	Typical pulse duration, mcbbsp4_clk ⁽⁶⁾ high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc(\text{clk})}$	Duty cycle error, mcbbsp4_clk ⁽⁶⁾	-2035	2035	-4069	4069	ps
	$t_{j(\text{clk})}$	Cycle jitter ⁽³⁾ , mcbbsp4_clk ⁽⁶⁾		1221		2000	ps
BS3	$t_{su(\text{fsV-clkAE})}$	Setup time, mcbbsp4_fs ⁽⁷⁾ valid before mcbbsp4_clk ⁽⁶⁾ active edge	6.0		11.9		ns
BS4	$t_{h(\text{clkAE-fsV})}$	Hold time, mcbbsp4_fs ⁽⁷⁾ valid after mcbbsp4_clk ⁽⁶⁾ active edge	0.2		0.3		ns
BS6	$t_{su(\text{drV-clkAE})}$	Setup time, mcbbsp4_dr valid before mcbbsp4_clk ⁽⁶⁾ active edge	6.0		11.9		ns
BS7	$t_{h(\text{clkAE-drV})}$	Hold time, mcbbsp4_dr valid after mcbbsp4_clk ⁽⁶⁾ active edge	0.2		0.3		ns

(1) Related to the input maximum frequency supported by the McBSP module.

(2) $P = \text{mcbbsp4_clkx} / \text{mcbbsp4_clkr}$ period in ns

(3) Maximum cycle jitter supported by mcbbsp4_clkx / mcbbsp4_clkr input clock.

(4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.

(5) The timings apply to all configurations regardless of mcbbsp4_clk polarity and which clock edges are used to drive output data and capture input data.

(6) mcbbsp4_clk corresponds to either mcbbsp4_clkx or mcbbsp4_clkr; mcbbsp4_clkr is available in 6-pin mode only.

(7) mcbbsp4_fs corresponds to either mcbbsp4_fsx or mcbbsp4_fsr; mcbbsp4_fsr is available in 6-pin mode only.

(8) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-71. McBSP4 Switching Characteristics—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS5	$t_{d(\text{clkxAE-dxV})}$	Delay time, input mcbbsp4_clkx active edge to output mcbbsp4_dx valid	0.9	23.2	1.0	40.0	ns
	$t_{R(dx)}$	Rise time, output mcbbsp4_dx	400	6500	400	6500	ps
	$t_{F(dx)}$	Fall time, output mcbbsp4_dx	400	6500	400	6500	ps

(1) The timings apply to all configurations regardless of mcbbsp4_clk polarity and which clock edges are used to drive output data and capture input data.

(2) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.1.3.2 McBSP4—I2S/PCM—Half-Cycle—24-MHz Master and 12-MHz Slave

Table 5-73 through Table 5-76 assume testing over the recommended operating conditions and electrical characteristic conditions below.

Table 5-72. McBSP4 Timing Conditions—I2S/PCM⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	400	6500	ps
t_F	Input signal fall time	400	6500	ps
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length, point-to-point interconnect		9	cm
	Characteristic impedance	30	55	Ω

(1) IO settings: MB[1:0] = 10 and LB0 = 0.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.1.3.2.1 McBSP4—I2S/PCM—Half-Cycle—24-MHz Master Mode

Table 5-73. McBSP4 Timing Requirements—I2S/PCM—Master Mode⁽¹⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM5	$t_{su(drV-clkAE)}$	Setup time, mcbbsp4_dr valid before mcbbsp4_clk ⁽²⁾ active edge	5.3		11.6		ns
BM6	$t_h(\text{clkAE-drV})$	Hold time, mcbbsp4_dr valid after mcbbsp4_clk ⁽²⁾ active edge	5.3		11.3		ns

(1) The timings apply to all configurations regardless of mcbbsp4_clk polarity and which clock edges are used to drive output data and capture input data.

(2) mcbbsp4_clk corresponds to either mcbbsp4_clkx or mcbbsp4_clkr; mcbbsp4_clkr is available in 6-pin mode only.

(3) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-74. McBSP4 Switching Characteristics—I2S/PCM—Master Mode⁽⁴⁾⁽⁸⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BM0	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , output mcbbsp4_clk clock		24 ⁽⁷⁾		12 ⁽⁷⁾	MHz

BS7	$t_{h(\text{clkAE-drV})}$	Hold time, mcbbsp4_dr valid after mcbbsp4_clk ⁽⁶⁾ active edge	0.3		0.3		ns

- (1) Related to the input maximum frequency supported by the McBSP module.
- (2) $P = \text{mcbasp4_clkx} / \text{mcbasp4_clkr}$ period in ns
- (3) Maximum cycle jitter supported by $\text{mcbasp4_clkx} / \text{mcbasp4_clkr}$ input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) The timings apply to all configurations regardless of mcbasp4_clk polarity and which clock edges are used to drive output data and capture input data.
- (6) mcbasp4_clk corresponds to either mcbasp4_clkx or mcbasp4_clkr ; mcbasp4_clkr is available in 6-pin mode only.
- (7) mcbasp4_fs corresponds to either mcbasp4_fsx or mcbasp4_fsr ; mcbasp4_fsr is available in 6-pin mode only.
- (8) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-76. McBSP4 Switching Characteristics—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
BS5	$t_{d(\text{clkxAE-dxV})}$	Delay time, input mcbasp4_clkx active edge to output mcbasp4_dx valid	1.0	23.2	1.1	40.0	ns
	$t_{R(dx)}$	Rise time, output mcbasp4_dx	400	6500	400	6500	ps
	$t_{F(dx)}$	Fall time, output mcbasp4_dx	400	6500	400	6500	ps

- (1) The timings apply to all configurations regardless of mcbasp4_clk polarity and which clock edges are used to drive output data and capture input data.
- (2) See DM Operating Condition Addendum for CORE OPP voltages.

Figure 5-71. McBSP4—I2S/PCM—Master Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

- (1) mcbasp4_clk corresponds to either mcbasp4_clkx or mcbasp4_clkr ; mcbasp4_fs corresponds to either mcbasp4_fsx or mcbasp4_fsr .
McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of mcbasp4_clk (rising or falling) on which mcbasp4_dx data is latched and mcbasp4_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see the Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

Figure 5-72. McBSP4—I2S/PCM—Slave Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

- (1) mcbbsp4_clk corresponds to either mcbbsp4_clkx or mcbbsp4_clkr; mcbbsp4_fs corresponds to either mcbbsp4_fsx or mcbbsp4_fsr. McBSP in 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins. McBSP in 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.
- (2) The polarity of McBSP frame synchronization is software configurable.
- (3) The active clock edge selection of mcbbsp4_clk (rising or falling) on which mcbbsp4_dx data is latched and mcbbsp4_dr data is sampled is software configurable.
- (4) Timing diagrams are for data delay set to 1.
- (5) For more information regarding the registers configuration see Serial Communication Interface / Multichannel Buffered Serial Port (McBSP) McBSP Register Manual / McBSP Registers / McBSP Register Summary Table section of the OMAP4470 TRM.

5.6.2 Multichannel Buffered Serial Port (McASP)

NOTE

For more information, see the Serial Communication Interface section of the OMAP4470 TRM.

Table 5-78 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-73).

Table 5-77. McASP Timing Conditions⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions				
	Number of external peripherals		1	
	Far end load		7	pF
	Trace length, point-to-point interconnect		10	cm
	Characteristic impedance	30	60	Ω

- (1) O settings: MB[1:0] = 10 and LB0 = 0. For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following: Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-78. McASP Switching Characteristics⁽⁴⁾

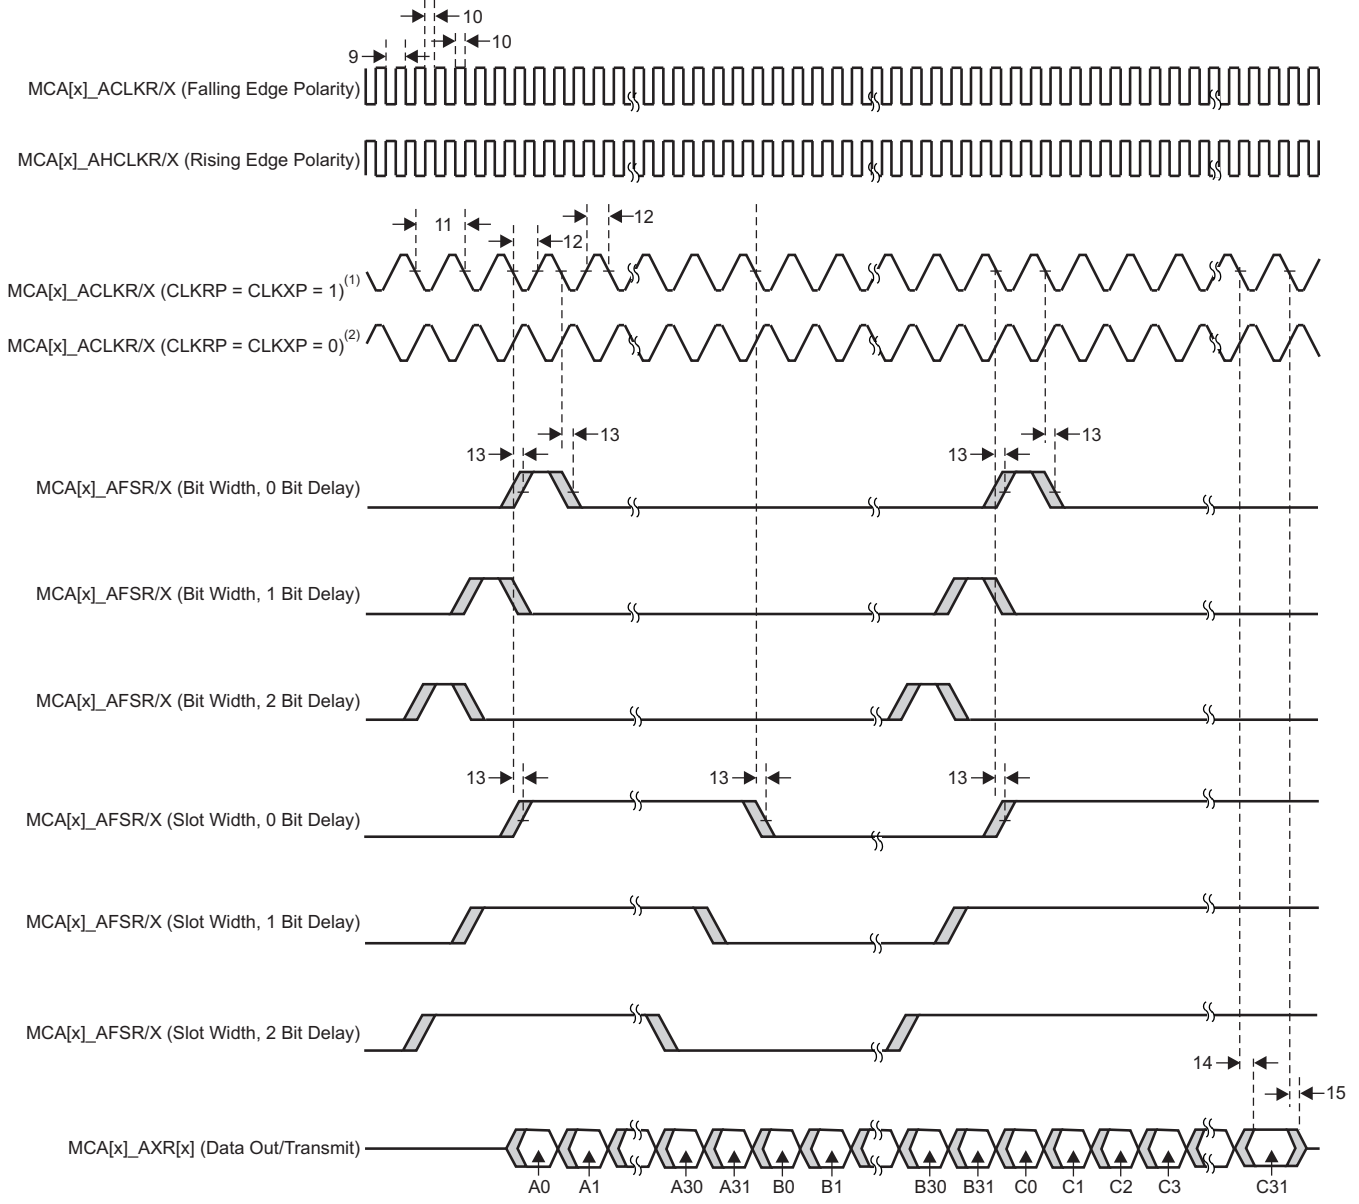

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
9	$1 / t_{c(AHCLKX)}$	Frequency ⁽¹⁾ , abe_mcaspl_ahclkx		24.576 ⁽³⁾		24.576 ⁽³⁾	MHz
10	$t_{w(AHCLKX)}$	Typical pulse duration, abe_mcaspl_ahclkx high or low	$0.5 \cdot P^{(2)} - 2.5$		$0.5 \cdot P^{(2)} - 2.5$		ns
11	$1 / t_{c(ACLKX)}$	Frequency ⁽¹⁾ , abe_mcaspl_aclkx		24.576 ⁽³⁾		24.576 ⁽³⁾	MHz
12	$t_{w(ACLKX)}$	Typical pulse duration, abe_mcaspl_aclkx high or low	$0.5 \cdot P^{(2)} - 2.5$		$0.5 \cdot P^{(2)} - 2.5$		ns
13	$t_{d(ACLKX-AFSX)}$	Delay time, abe_mcaspl_aclkx transmit edge to abe_mcaspl_afsx output valid	0	6	0	6	ns
14	$t_{d(ACLKX-AXR)}$	Delay time, abe_mcaspl_aclkx transmit edge to abe_mcaspl_axr output valid	0	6	0	6	ns
15	$t_{dis(AXR-ACLKX)}$	Disable time, abe_mcaspl_aclkx transmit edge to abe_mcaspl_axr output high impedance	0	6	0	6	ns

(1) Related to the input maximum frequency supported by the McASP module.

(2) P = AHCLKR/X period

(3) This McASP output clock frequency is based on an output ABE DPLL configured at 196.608 MHz. For more information regarding the registers configuration, see the Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_ABE Description section of the OMAP4470 TRM.

(4) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-105

Figure 5-73. McASP Output Timing⁽¹⁾⁽²⁾

- (1) For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- (2) For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

5.6.3 Multichannel Serial Port Interface (McSPI)

NOTE

For more information, see the Serial Communication Interface section of the OMAP4470 TRM.

McSPI allows a duplex, synchronous, serial communication between a local host and SPI compliant external devices. The following timings are applicable to the different configurations of McSPI in master/slave mode for any McSPI and any channel (n).

5.6.3.1 McSPI—MCSPI Interface in Transmit and Receive—Slave Mode

In slave mode, McSPI initiates data transfer on the data lines (mcspix_somi, mcspix_simo) when it receives an SPI clock (mcspix_clk) from the external SPI master device.

NOTE

With other system conditions (for instance with a less jitter and duty cycle error source clock), 24 MHz of clock frequency could be reached.

5.6.3.1.1 McSPI1

Table 5-80 and Table 5-81 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-74 and Figure 5-75).

Table 5-79. McSPI1 Timing Conditions—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1.00	3.00	ns
t _F	Input signal fall time	1.00	3.00	ns
PCB Conditions				
	Number of external peripherals		-	
	Far end load		5	pF
	Trace length	2	5	cm
	Characteristic impedance	20	70	Ω

(1) McSPI1:

- Balls AF22 / AE22 / AG22 / AE23 / AF23 (mcspi1_clk / mcspi1_somi / mcspi1_simo / mcspi1_cs0 / mcspi1_cs1):
SC[1:0] = 00 and LB[1:0] = 10
For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / Low Speed I/Os Combined Slew Rate vs TL Length and Load Settings section of the OMAP4470 TRM.
- Balls AG23 / AH23 (mcspi1_cs2 / mcspi1_cs3):
MB[1:0] = 11 and LB0 = 0
For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-80. McSPI1 Timing Requirements—Slave Mode⁽⁴⁾⁽⁷⁾

NO.	PARAMETER		16 MHz SET		8 MHz SET		UNIT
			MIN	MAX	MIN	MAX	
SS1	1 / t _c (clk)	Frequency ⁽¹⁾ , mcspi1_clk ⁽⁵⁾		16 ⁽⁷⁾		8 ⁽⁷⁾	MHz
SS2	t _w (clkL)	Typical pulse duration, mcspi1_clk ⁽⁵⁾ low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
SS3	t _w (clkH)	Typical pulse duration, mcspi1_clk ⁽⁵⁾ high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	t _{dc} (clk)	Duty cycle error, mcspi1_clk	-3125	3125	-6250	6250	ps
	t _j (clk)	Cycle jitter ⁽³⁾ , mcspi1_clk	-1875	1875	-2000	2000	ps
	t _R (clk)	Rise time, mcspi1_clk		3000		3000	ps
	t _F (clk)	Fall time, mcspi1_clk		3000		3000	ps
SS4	t _{su} (SIMO-CLKAE)	Setup time, mcspi1_simo valid before mcspi1_clk ⁽⁵⁾ active edge	12.82		28.61		ns

Table 5-80. McSPI1 Timing Requirements—Slave Mode⁽⁴⁾⁽⁷⁾ (continued)

NO.	PARAMETER		16 MHz SET		8 MHz SET		UNIT
			MIN	MAX	MIN	MAX	
SS5	$t_{h(\text{clkAE-SIMO})}$	Hold time, mcspi1_simo valid after mcspi1_clk ⁽⁵⁾ active edge	12.82		28.61		ns
SS8	$t_{su(\text{CS-CLKAE})}$	Setup time, mcspi1_cs0 valid before mcspi1_clk ⁽⁵⁾ first edge	12.82		28.61		ns
SS9	$t_{h(\text{clkAE-CS})}$	Hold time, mcspi1_cs0 valid after mcspi1_clk ⁽⁵⁾ last edge	12.82		28.61		ns

- (1) Related to the input maximum frequency supported by the McSPI module.
- (2) P = mcspi1_clk period in ns
- (3) Maximum cycle jitter supported by mcspi1_clk input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) This timing applies to all configurations regardless of mcspi1_clk polarity and which clock edges are used to drive output data and capture input data.
- (6) With other system conditions (for instance with a less jitter and duty cycle error source clock), 24 MHz of clock frequency could be reached.
- (7) The timings requirements described are applicable to both CORE OPP50 and OPP100 operating points.

Table 5-81. McSPI1 Switching Characteristics—Slave Mode⁽²⁾⁽³⁾

NO.	PARAMETER		16 MHz SET ⁽³⁾		8 MHz SET ⁽³⁾		UNIT
			MIN	MAX	MIN	MAX	
SS6	$t_{d(\text{clk-SOMI})}$	Delay time, mcspi1_clk ⁽¹⁾ active edge to mcspi1_somi transition	-4.66	18.41	-12.01	37.32	ns
SS7	$t_{d(\text{CS-SOMI})}$	Delay time, mcspi1_cs0 active edge to mcspi1_somi transition		18.41		37.32	ns
	$t_{R(\text{SOMI})}$	Rise time, mcspi1_somi		4000.0		4000.0	ps
	$t_{F(\text{SOMI})}$	Fall time, mcspi1_somi		4000.0		4000.0	ps

- (1) The polarity of mcspi1_clk and the active edge (rising or falling) on which mcspi1_simo is driven and mcspi1_somi is latched is all software configurable:

- mcspi1_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 0 (Modes 0 and 2).

For more information, see the McSPI environment chapter, Data Format Configurations section of the OMAP4470 TRM for modes and phase correspondence description.

- (2) This timing applies to all configurations regardless of mcspi1_clk polarity and which clock edges are used to drive output data and capture input data.
- (3) The timings requirements described are applicable to both CORE OPP50 and OPP100 operating points.

5.6.3.1.2 McSPI2 and McSPI4

Table 5-83 and Table 5-84 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-74 and Figure 5-75).

Table 5-82. McSPI2 and McSPI4 Timing Conditions—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1.00	4.00	ns
t_F	Input signal fall time	1.00	4.00	ns
PCB Conditions				
	Number of external peripherals		-	
	Far end load		5	pF
	Trace length	2	5	cm
	Characteristic impedance	20	60	Ω

- (1) IO settings: LB0 = 0 and MB[1:0] = 11.
For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-83. McSPI2 and McSPI4 Timing Requirements—Slave Mode⁽⁴⁾⁽⁷⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SS1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , mcspix_clk ⁽⁵⁾		16 ⁽⁶⁾		8	MHz
SS2	$t_{w(\text{clkL})}$	Typical pulse duration, mcspix_clk ⁽⁵⁾ low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
SS3	$t_{w(\text{clkH})}$	Typical pulse duration, mcspix_clk ⁽⁵⁾ high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc(\text{clk})}$	Duty cycle error, mcspix_clk	-3125	3125	-6250	6250	ps
	$t_{j(\text{clk})}$	Cycle jitter ⁽³⁾ , mcspix_clk	-1875	1875	-2000	2000	ps
	$t_{R(\text{clk})}$	Rise time, mcspix_clk		4000		4000	ps
	$t_{F(\text{clk})}$	Fall time, mcspix_clk		4000		4000	ps
SS4	$t_{su(\text{SIMO-clkAE})}$	Setup time, mcspix_simo valid before mcspix_clk ⁽⁵⁾ active edge	12.95		28.74		ns
SS5	$t_{h(\text{clkAE-SIMO})}$	Hold time, mcspix_simo valid after mcspix_clk ⁽⁵⁾ active edge	12.95		28.74		ns
SS8	$t_{su(\text{CS-clkAE})}$	Setup time, mcspix_cs0 valid before mcspix_clk ⁽⁵⁾ first edge	12.95		28.74		ns
SS9	$t_{h(\text{clkAE-CS})}$	Hold time, mcspix_cs0 valid after mcspix_clk ⁽⁵⁾ last edge	12.95		28.74		ns

- (1) Related to the input maximum frequency supported by the McSPI module.
- (2) P = mcspix_clk period in ns
- (3) Maximum cycle jitter supported by mcspix_clk input clock.
- (4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (5) This timing applies to all configurations regardless of mcspix_clk polarity and which clock edges are used to drive output data and capture input data.
- (6) With other system conditions (for instance with a less jitter and duty cycle error source clock), 24 MHz of clock frequency could be reached.
- (7) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-84. McSPI2 and McSPI4 Switching Characteristics—Slave Mode⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SS6	$t_{d(\text{clk-SOMI})}$	Delay time, mcspi2_clk ⁽¹⁾ active edge to mcspi2_somi transition	-3.48	16.60	-10.83	36.14	ns
SS7	$t_{d(\text{CS-SOMI})}$	Delay time, mcspi2_cs0 active edge to mcspi2_somi transition		16.60		36.14	ns
	$t_{R(\text{SOMI})}$	Rise time, mcspi2_somi		5545		5545	ps
	$t_{F(\text{SOMI})}$	Fall time, mcspi2_somi		5545		5545	ps

- (1) The polarity of mcspi2_clk and the active edge (rising or falling) on which mcspi2_simo is driven and mcspi2_somi is latched is all software configurable:
 - mcspi2_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 0 (Modes 0 and 2).

For more information, see the McSPI environment chapter, Data Format Configurations section of the OMAP4470 TRM for modes and phase correspondence description.

- (2) This timing applies to all configurations regardless of mcspi2_clk polarity and which clock edges are used to drive output data and capture input data.
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.3.1.3 McSPI3

Table 5-86 and Table 5-87 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-74 and Figure 5-75).

Table 5-85. McSPI3 Timing Conditions—Slave Mode⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1.00	4.00	ns
t_F	Input signal fall time	1.00	4.00	ns
PCB Conditions				
	Number of external peripherals		-	
	Far end load		5	pF
	Trace length	2	5	cm
	Characteristic impedance	20	50	Ω

(1) IO settings: DS0 = 0.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-86. McSPI3 Timing Requirements—Slave Mode⁽⁴⁾⁽⁷⁾

(2) This timing applies to all configurations regardless of mcspi3_clk polarity and which clock edges are used to drive output data and capture input data.

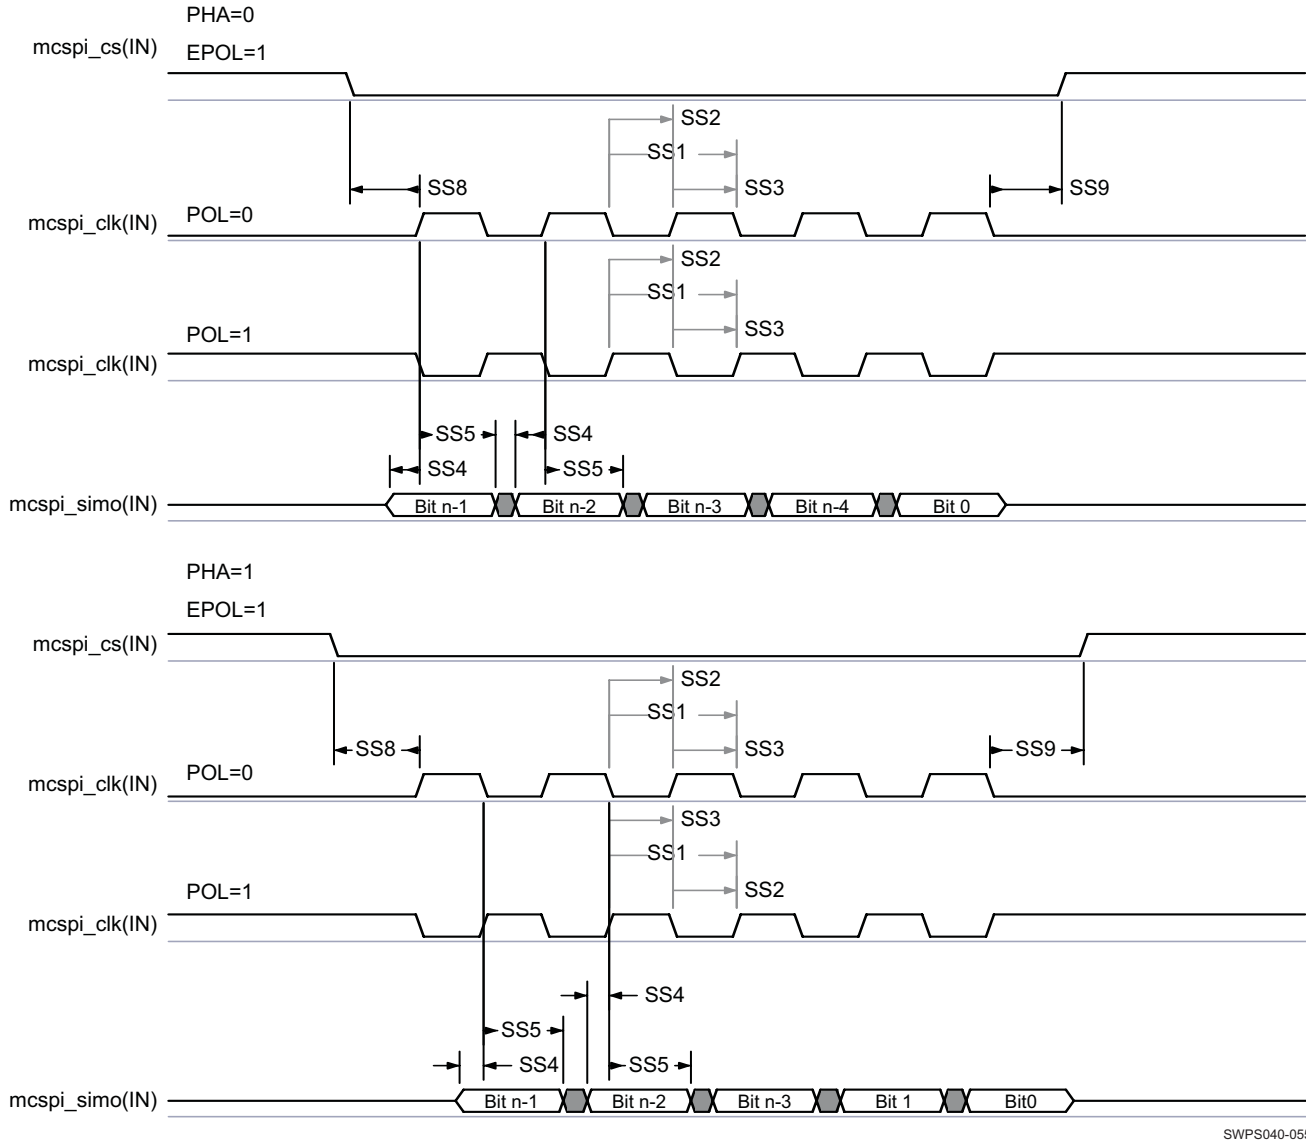

(3) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-054

Figure 5-74. McSPI—Slave Mode—Transmit⁽¹⁾⁽²⁾⁽³⁾

- (1) The active clock edge selection of mcspix_clk (rising or falling) on which mcspix_simo is driven and mcspix_somi data is latched is software configurable with the bit MCSPI_Ch(i)CONF[1] = POL and the bit MCSPI_Ch(i)CONF[0] = PHA.
- (2) The polarity of mcspix_cs is software configurable with the bit MCSPI_Ch(i)CONF[6] = EPOL.
- (3) In mcspix, x is equal to 1, 2, 3, or 4.

SWPS040-055

Figure 5-75. McSPI—Slave Mode—Receive⁽¹⁾⁽²⁾⁽³⁾

- (1) The active clock edge selection of mcspix_clk (rising or falling) on which mcspix_simo is driven and mcspix_somi data is latched is software configurable with the bit MCSPI_Ch(i)CONF[1] = POL and the bit MCSPI_Ch(i)CONF[0] = PHA.
- (2) The polarity of mcspix_cs is software configurable with the bit MCSPI_Ch(i)CONF[6] = EPOL.
- (3) In mcspix, x is equal to 1, 2, 3, or 4.

5.6.3.2 McSPI—McSPI Interface in Transmit and Receive—Master Mode

In master mode, McSPI supports multichannel communication. McSPI initiates a data transfer on the data lines (SPIDAT [1:0]) and generates clock (SPICLK) and control signals (SPIEN) to a single SPI slave device at a time.

5.6.3.2.1 McSPI1 and McSPI2—Master Mode—24-MHz Frequency Clock

Table 5-89 and Table 5-90 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-76 and Figure 5-77).

Table 5-88. McSPI1 Timing Conditions—Master Mode⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	0.4	5	ns
t_F	Input signal fall time	0.4	5	ns
PCB Conditions				
	Number of external peripherals		4	
	Far end load		25	pF
	Trace length	1	10	cm
	Characteristic impedance	30	60	Ω

(1) IO settings:

– McSPI1:

– Balls AF22 / AE22 / AG22 / AE23 / AF23 (mcspi1_clk / mcspi1_somi / mcspi1_simo / mcspi1_cs0 / mcspi1_cs1):
SC[1:0] = 00 and LB[1:0] = 10

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / Low Speed I/Os Combined Slew Rate vs TL Length and Load Settings section of the OMAP4470 TRM.

– Balls AG23 / AH23 (mcspi1_cs2 / mcspi1_cs3):
MB[1:0] = 11 and LB0 = 0

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-89. McSPI1 Timing Requirements—Master Mode⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT

	$t_{F(\text{SIMO})}$	Fall time, mcspi1_simo		10685		10685	ps
	$t_{R(\text{CS})}$	Rise time, mcspi1_cs[3:0]		10685		10685	ps
	$t_{F(\text{CS})}$	Fall time, mcspi1_cs[3:0]		10685		10685	ps

(1) The polarity of mcspi1_clk and the active edge (rising or falling) on which mcspi1_simo is driven and mcspi1_somi is latched is all software configurable:

- mcspi1_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 1 (Modes 1 and 3).
- mcspi1_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 0 (Modes 0 and 2).

For more information, see the McSPI environment chapter, Data Format Configurations section of the OMAP4470 TRM for modes and phase correspondence description.

(2) P = mcspi1_clk clock period

(3) The jitter probability density can be approximated by a Gaussian function.

(4) This timing applies to all configurations regardless of mcspi1_clk polarity and which clock edges are used to drive output data and capture input data.

(5) Case P = 48 MHz: A = (TCS + 1) * T_{SPICLKREF} (TCS is a bit field of MCSPI_Ch(i)CONF register)
 Case P < 48 MHz: A = (TCS + 0.5) * F_{RATIO} * T_{SPICLKREF} (TCS is a bit field of MCSPI_Ch(i)CONF register)
 For more information, see the McSPI chapter of the OMAP4470 TRM.

(6) B = (TCS + 0.5) * T_{SPICLKREF} * F_{RATIO} (TCS is a bit field of MCSPI_Ch(i)CONF register, F_{RATIO}: Even ≥ 2).
 For more information, see the McSPI chapter of the OMAP4470 TRM.

(7) This McSPI1 output clock frequency is based on an output PER DPLL configured at 96 MHz.
 For more information regarding the registers configuration, see Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_PER Description section of the OMAP4470 TRM.

(8) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-92 and Table 5-93 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-76 and Figure 5-77).

Table 5-91. McSPI2 Timing Conditions—Master Mode—24 MHz⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	100.00	12500.00	ps
t_F	Input signal fall time	100.00	12500.00	ps
PCB Conditions				
	Number of external peripherals		2	
	Far end load		20	pF
	Trace length	1	10	cm
	Characteristic impedance	30	55	Ω

(1) IO settings: MB[1:0] = 10 and LB0 = 1

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-92. McSPI2 Timing Requirements—Master Mode⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SM4	$t_{su(SOMI-clkAE)}$	Setup time, mcspi2_somi valid before mcspi2_clk ⁽¹⁾ active edge	2.72		2.72		ns
SM5	$t_{h(clkAE-SOMI)}$	Hold time, mcspi2_somi valid after mcspi2_clk ⁽¹⁾ active edge	2.23		2.23		ns

(1) This timing applies to all configurations regardless of mcspi2_clk polarity and which clock edges are used to drive output data and capture input data.

(2) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-93. McSPI2 Switching Requirements—Master Mode⁽⁸⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

(1) The polarity of mcspi4_clk and the active edge (rising or falling) on which mcspi4_simo is driven and mcspi4_somi is latched is all software configurable:

- mcspi4_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 1 (Modes 1 and 3).
- mcspi4_clk phase programmable with the bit PHA of MCSPI_Ch(i)CONF register: PHA = 0 (Modes 0 and 2).

For more information, see the McSPI environment chapter, Data Format Configurations section of the OMAP4470 TRM for modes and phase correspondence descriptions.

(2) P = mcspi4_clk clock period

(3) The jitter probability density can be approximated by a Gaussian function.

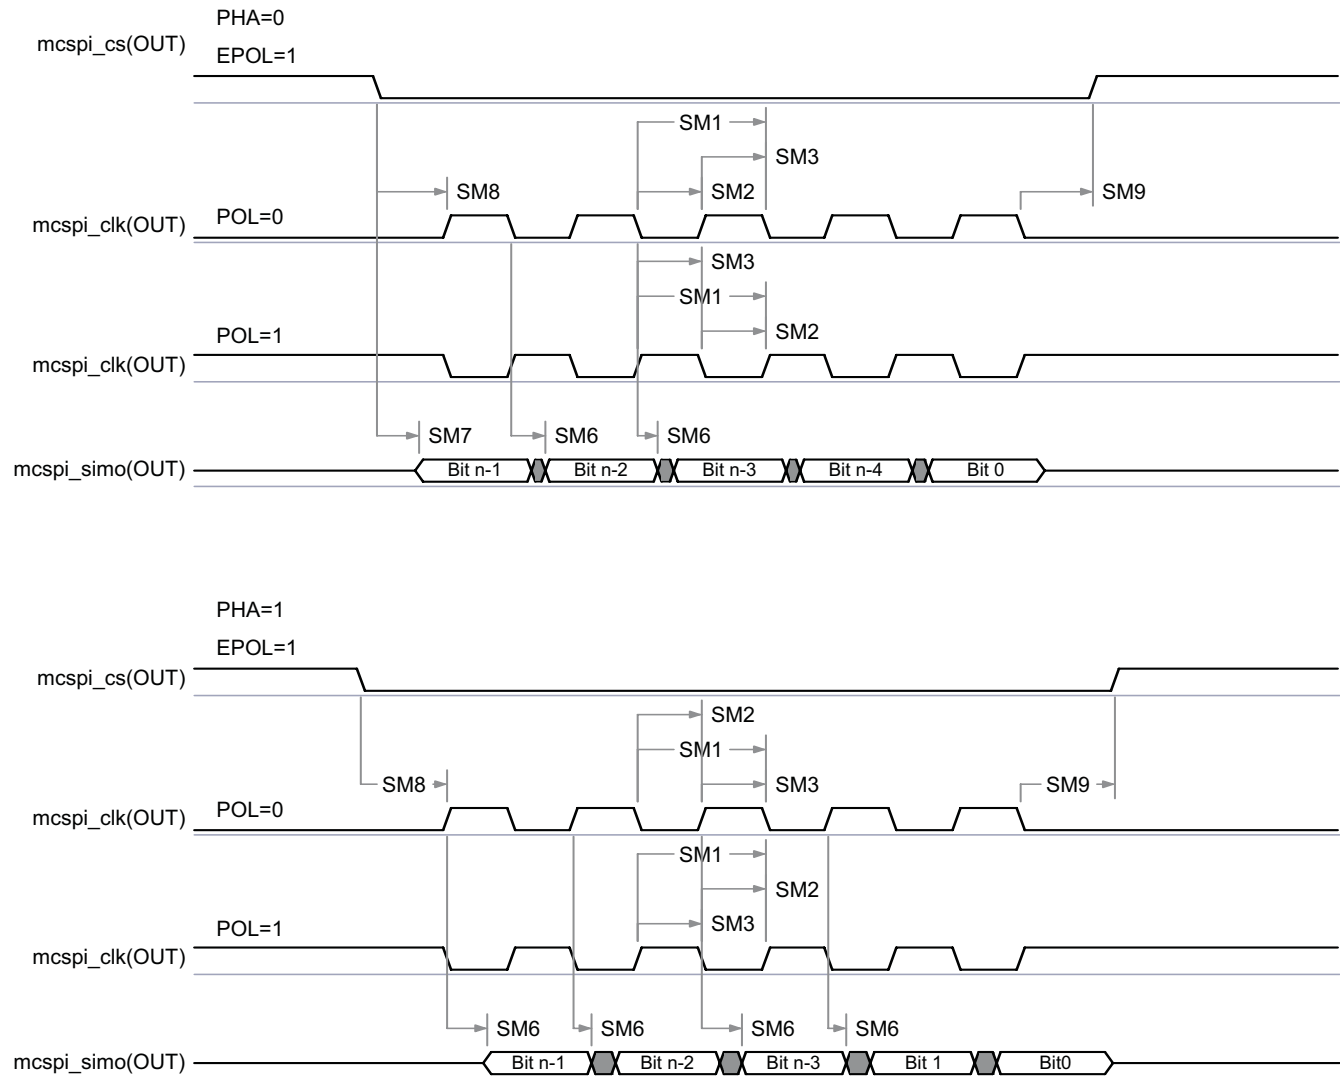

(4) This timing applies to all configurations regardless of mcspi4_clk polarity and which clock edges are used to drive output data and capture input data.

(5) Case P = 48 MHz: A = (TCS + 1) * T_{SPICLKREF} (TCS is a bit field of MCSPI_Ch(i)CONF register)
Case P < 48 MHz: A = (TCS + 0.5) * F_{RATIO} * T_{SPICLKREF} (TCS is a bit field of MCSPI_Ch(i)CONF register)
For more information, see the McSPI chapter of the OMAP4470 TRM.

(6) B = (TCS + 0.5) * T_{SPICLKREF} * F_{RATIO} (TCS is a bit field of MCSPI_Ch(i)CONF register, F_{RATIO}: Even ≥ 2).
For more information, see the McSPI chapter of the OMAP4470 TRM.

(7) This McSPI4 output clock frequency is based on an output PER DPLL configured at 96 MHz.
For more information regarding the registers configuration, see Power, Reset and Clock Management / Clock Management Functional Description / Internal Clock Sources/Generators / DPLL_PER Description section of the OMAP4470 TRM.

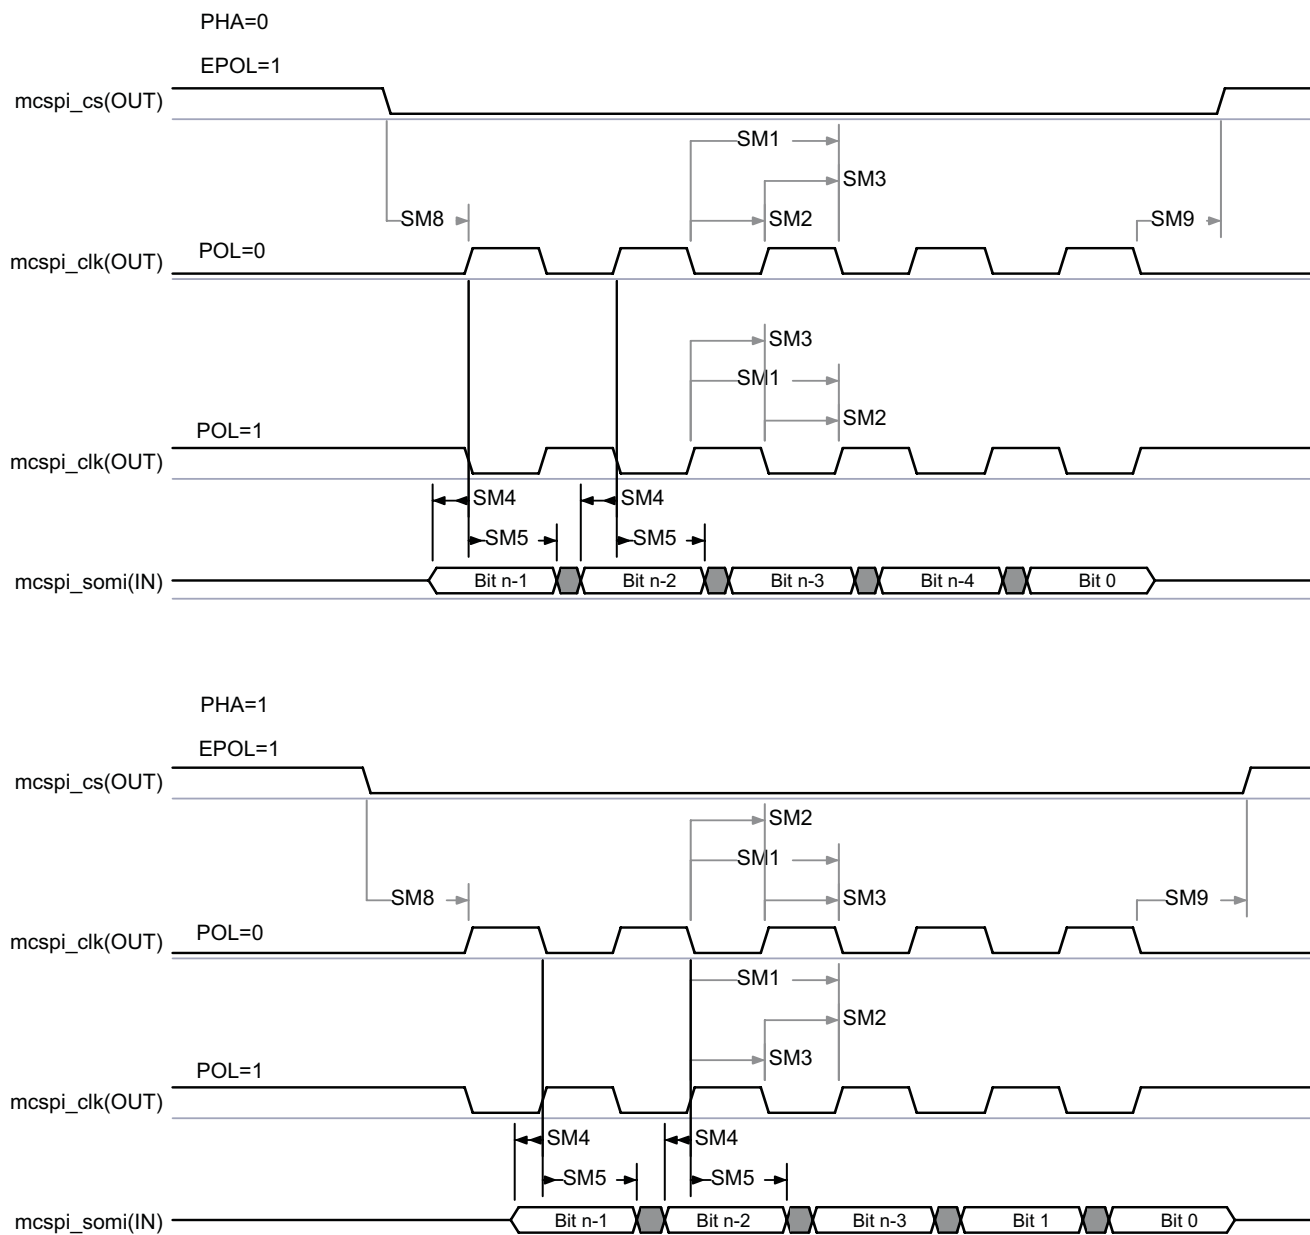

(8) See DM Operating Condition Addendum for CORE OPP voltages.

SWPS040-056

Figure 5-76. McSPI—Master Mode—Transmit⁽¹⁾⁽²⁾⁽³⁾

- (1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_simo data is latched is software configurable with the bit MCSPI_Ch(i)CONF[1] = POL and the bit MCSPI_Ch(i)CONF[0] = PHA.
- (2) The polarity of mcspi_ncs is software configurable with the bit MCSPI_Ch(i)CONF[6] = EPOL.
- (3) In mcspix, x is equal to 1, 2, 3, or 4.

SWPS040-057

Figure 5-77. McSPI—Master Mode—Transmit⁽¹⁾⁽²⁾⁽³⁾

- (1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_somi data is latched is software configurable with the bit MCSPI_Ch(i)CONF[1] = POL and the bit MCSPI_Ch(i)CONF[0] = PHA.
- (2) The polarity of mcspi_ncs is software configurable with the bit MCSPI_Ch(i)CONF[6] = EPOL.
- (3) In mcspix, x is equal to 1, 2, 3, or 4.

5.6.4 Digital Microphone (DMIC)

NOTE

For more information, see the Digital Microphone Controller chapter in the OMAP4470 TRM.

The DMIC allows support of up to three digital stereo microphones that send it a pulse-density modulated stream of bits, transferred on one period or one half-period of the clock (over-sampling clock) provided to the DMIC.

Table 5-104 and Table 5-105 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-79).

Table 5-103. DMIC Timing Conditions—Master/Receive Mode⁽¹⁾⁽²⁾⁽⁴⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time		10	ns
t_F	Input signal fall time		10	ns
PCB Conditions ⁽³⁾				
	Number of external peripherals		See ⁽⁵⁾	
	Far end load when accounting for external ESD protection		20	pF
	Trace length		25	cm
	Characteristic impedance	40	70	Ω

(1) IO settings: LB0 = 0 and MB[1:0] = 10

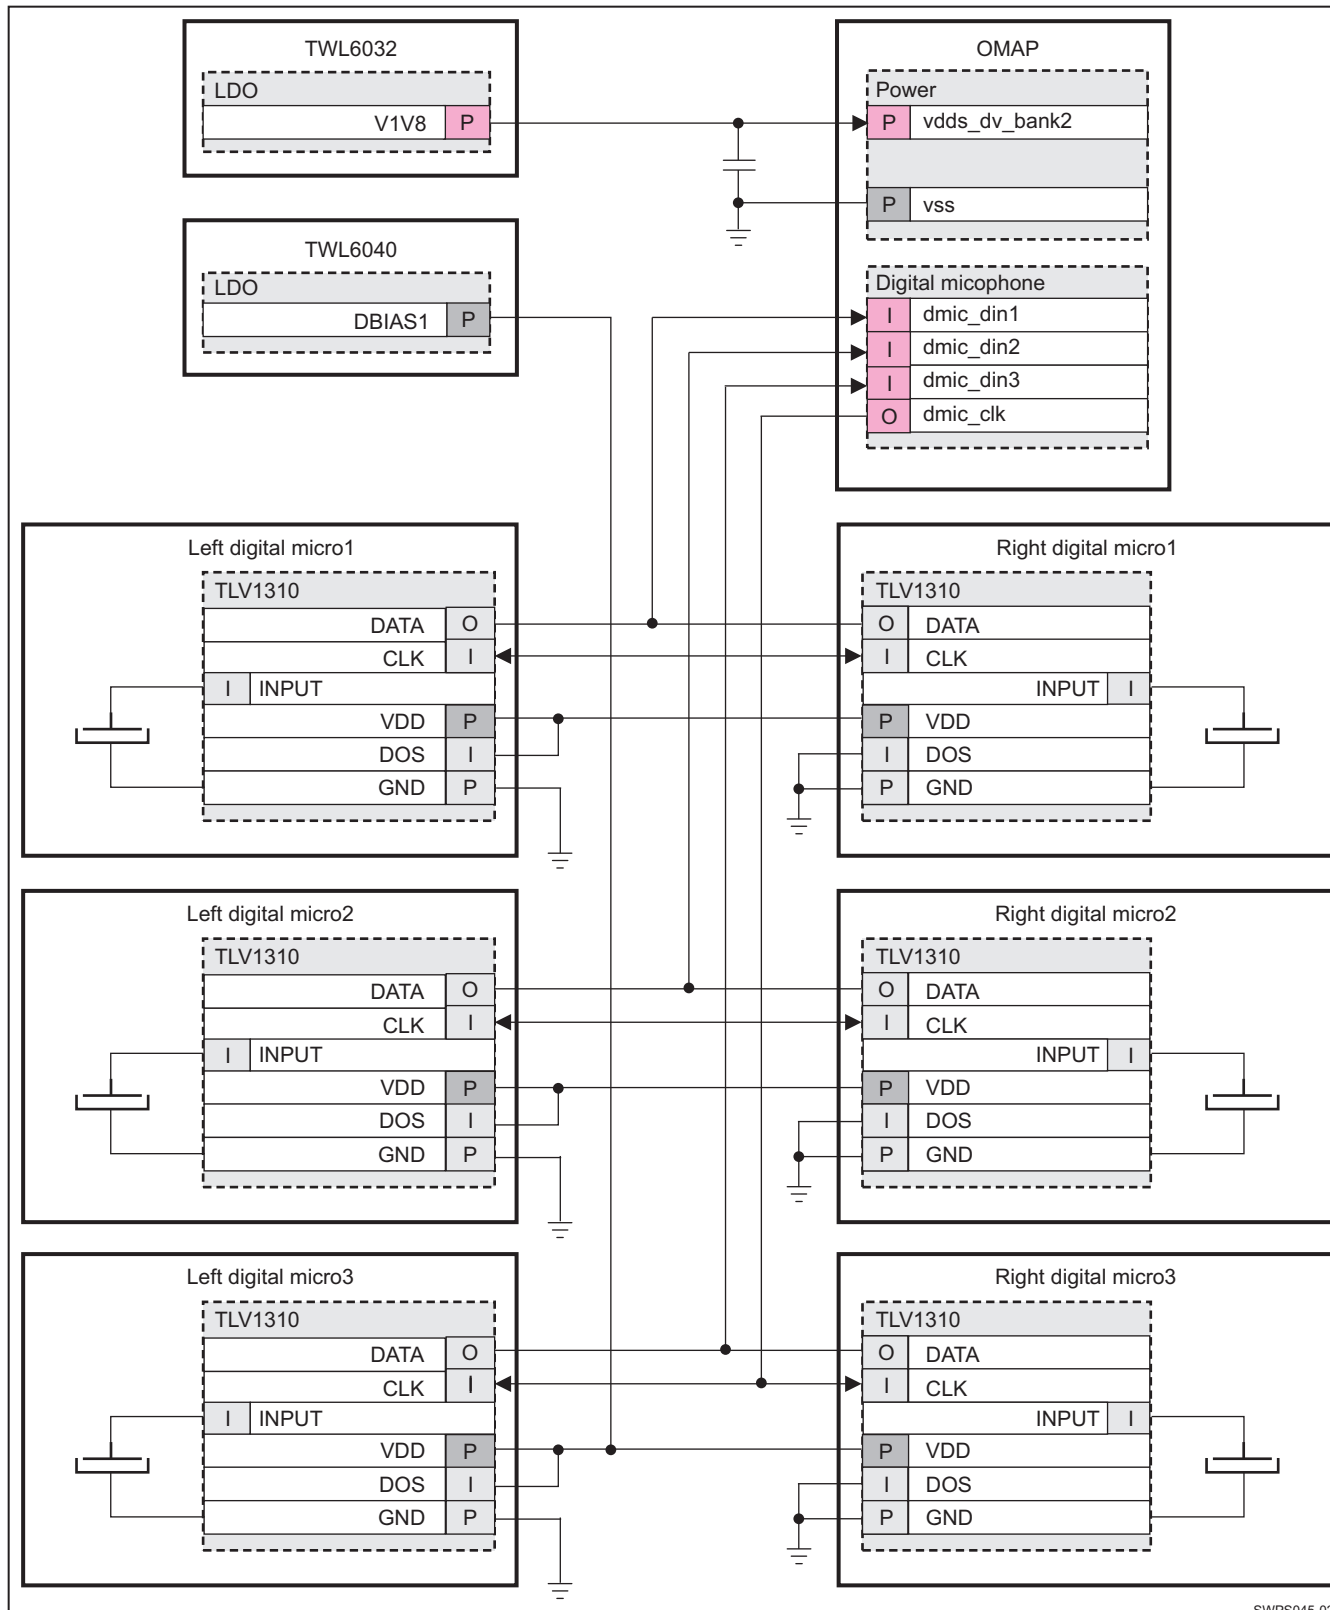

- For balls AE24 / AF24 / AG24 / AH24 (abe_dmic_clk1 / abe_dmic_din1 / abe_dmic_din2 / abe_dmic_din3 in multiplexing mode 0), for more information see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- For balls AF16 / AG16 (abe_dmic_din3 / abe_dmic_clk3 in multiplexing mode 5), see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDDS. For more information on the corresponding OMAP4 VDDS power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) Figure 5-78 shows an example of DMIC implementation.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

(5) For more information on the peripheral conditions, see Figure 5-78, DMIC Implementation Example.

SWPS045-022

Figure 5-78. DMIC Implementation Example⁽¹⁾

(1) It is also possible to use different PCB guideline clock outputs rather than sharing one as described in above implementation example. In such case, each pair (pair [3:1]) of digital microphone can be connected to a dedicated data and clock signals (dmic_din[3:1], dmic_clk[3:1]). This way each microphone is turned off independently from each others.

Table 5-104. DMIC Timing Requirements—Master/Receive Mode

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DMIC4	$t_{su(dV-clkH)}$	Setup time, input <code>abe_dmic_din[3:1]</code> valid before <code>abe_dmic_clk[3:1]</code> rising/falling edge	72.3		72.3		ns
DMIC5	$t_{h(clkH-dV)}$	Hold time, output <code>abe_dmic_din[3:1]</code> valid after <code>abe_dmic_clk[3:1]</code> rising/falling edge	-0.7		-0.7		ns

Table 5-105. DMIC Switching Characteristics—Master/Receive Mode⁽⁴⁾

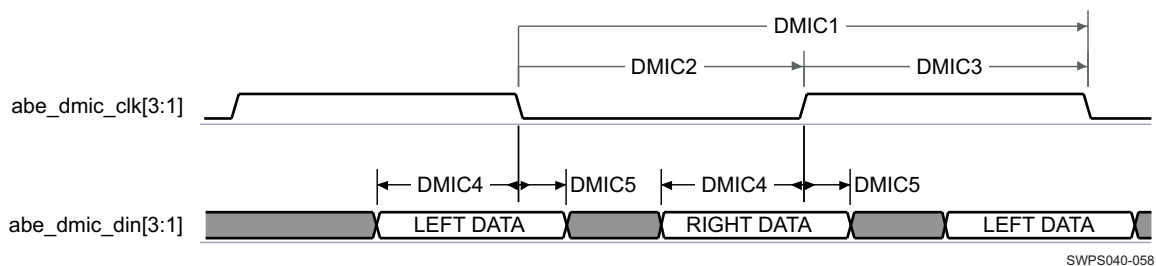

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DMIC1	$1 / t_{c(clk)}$	Frequency ⁽¹⁾ output dmic clock <code>abe_dmic_clk[3:1]</code>		3.84		3.84	MHz
DMIC2	$t_{w(clkL)}$	Pulse duration, output dmic clock <code>abe_dmic_clk[3:1]</code> low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
DMIC3	$t_{w(clkH)}$	Pulse duration, output dmic clock <code>abe_dmic_clk[3:1]</code> high	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc(clk)}$	Duty cycle error, output dmic clock <code>abe_dmic_clk[3:1]</code>		13		13	ns
	$t_{j(clk)}$	Jitter standard deviation ⁽³⁾ , output dmic clock <code>abe_dmic_clk[3:1]</code>		67		67	ns
	$t_{R(clk)}$	Rise time, output dmic clock <code>abe_dmic_clk[3:1]</code>		10		10	ns
	$t_{F(clk)}$	Fall time, output dmic clock <code>abe_dmic_clk[3:1]</code>		10		10	ns

(1) Related to the output `abe_dmic_clk[3:1]` maximum frequency programmable.

(2) P = output `abe_dmic_clk[3:1]` period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) See DM Operating Condition Addendum for CORE OPP voltages.

**Figure 5-79. DMIC—Master DDR Receive Mode⁽¹⁾**

(1) RIGHT/LEFT DATA capturing edges depend on the DOS DMIC pin implementation.

5.6.5 Multichannel Pulse Density Modulation (McPDM)

Multichannel pulse density modulation interface (McPDM) is an audio module dedicated to mobile telephone terminal. It's composed of uplink and downlink paths both communicating with audio companion chip through a dedicated interface. Aim of the uplink path is to process data from the MCPDM interface, decimate and filter the data, and store them in FIFO. FIFO will be controlled by IRQ or DMA request and fed outside from MCPDM module following standard OCP format.

Aim of the downlink path is to process data coming from FIFO, through sigma-delta converter and feed it to MCPDM interface. The data is also transmitted to audio companion chip by operating a sample frequency conversion.

Table 5-107 and Table 5-108 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-80 and Figure 5-81).

Table 5-106. MCPDM Timing Conditions⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1.00	6.00	ns
t_F	Input signal fall time	1.00	6.00	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		5	cm
	Characteristic impedance	20	65	Ω

(1) IO settings: MB[1:0]= 01 and LB0 = 0

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50- Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-107. MCPDM Timing Requirements—Master and Receive SDR Mode⁽³⁾

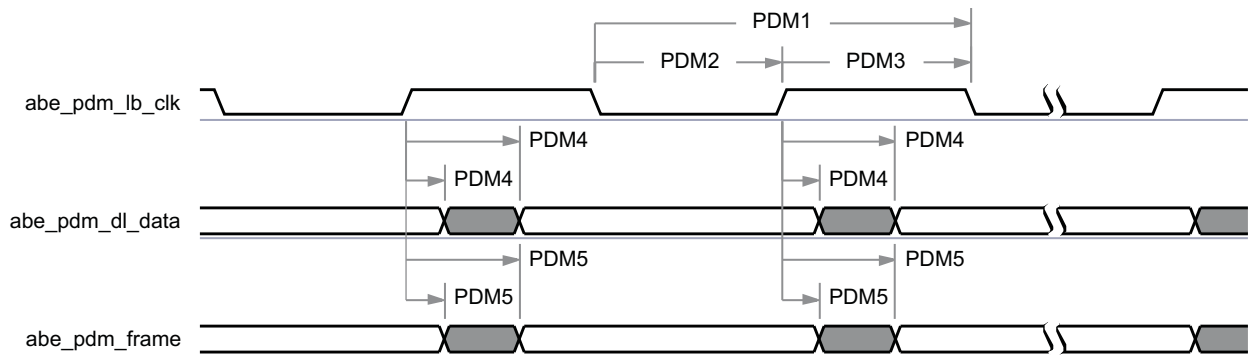

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$f_c(\text{clks})$	Input abe_clks ⁽²⁾ frequency		19.2 ⁽²⁾		19.2 ⁽²⁾	MHz
	$t_w(\text{clksL})$	Typical pulse duration, input abe_clks low	0.5 * P ⁽¹⁾		0.5 * P ⁽¹⁾		ns
	$t_w(\text{clksH})$	Typical pulse duration, output abe_clks high	0.5 * P ⁽¹⁾		0.5 * P ⁽¹⁾		ns
	$t_{dc}(\text{clks})$	Duty cycle error, input abe_clks	-0.05 * P ⁽¹⁾ – + 1450	0.05 * P ⁽¹⁾ – 1450	-0.05 * P ⁽¹⁾ – + 1450	0.05 * P ⁽¹⁾ – 1450	ps
	$t_j(\text{clks})$	Jitter peak to peak, input abe_clks		300		300	ps
PDM6	$t_{su}(\text{ulV-clkH})$	Setup time, abe_pdm_ul_data valid before abe_pdm_lb_clk rising edge	21.68		21.68		ns
PDM7	$t_h(\text{clkH-ulV})$	Hold time, abe_pdm_ul_data valid after abe_pdm_lb_clk rising edge	0.10		0.10		ns
PDM8	$t_{su}(\text{frameV-clkH})$	Setup time, abe_pdm_frame valid before abe_pdm_lb_clk rising edge	21.68		21.68		ns
PDM9	$t_h(\text{clkH-frameV})$	Hold time, abe_pdm_frame valid after abe_pdm_lb_clk rising edge	0.10		0.10		ns

- (1) $P = \text{abe_clks}$ input clock period in ns
- (2) The McBSP (interface 1, 2, or 3) can be used at the same time with McPDM one. In this case, abe_clks clock is shared, that means identical, between McPDM and McBSP. As a consequence, the minimum clock frequency between McPDM and McBSP, input jitter, and duty cycle must be considered between both interfaces.
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-108. McPDM Switching Characteristics—Master and Transmit SDR Mode⁽⁴⁾⁽⁵⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
PDM1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ output abe_pdm_lb_clk clock		19.2		19.2	MHz
PDM2	$t_{w(\text{clkH})}$	Typical pulse duration, output abe_pdm_lb_clk high	$0.5 \cdot P^{(2)}$		$0.5 \cdot P^{(2)}$		ns
PDM3	$t_{w(\text{clkL})}$	Typical pulse duration, output abe_pdm_lb_clk low	$0.5 \cdot P^{(2)}$		$0.5 \cdot P^{(2)}$		ns
	$t_{dc(\text{clk})}$	Duty cycle error, output abe_pdm_lb_clk	-2604	2604	-2604	2604	ps
	$t_{j(\text{clk})}$	Jitter standard deviation ⁽³⁾ , output abe_pdm_lb_clk		434		434	ps
	$t_{R(\text{clk})}$	Rise time, output abe_pdm_lb_clk		5		5	ns
	$t_{F(\text{clk})}$	Fall time, output abe_pdm_lb_clk		5		5	ns
PDM4	$t_{d(\text{clkH-dlV})}$	Delay time, output abe_pdm_lb_clk high to output abe_pdm_dl_data valid	1.45	33.03	1.45	33.03	ns
PDM5	$t_{d(\text{clkH-frameV})}$	Delay time, output abe_pdm_lb_clk high to output abe_pdm_frame valid	1.45	33.03	1.45	33.03	ns
	$t_{R(\text{dl})}$	Rise time, output abe_pdm_dl_data		5		5	ns
	$t_{F(\text{dl})}$	Fall time, output abe_pdm_dl_data		5		5	ns
	$t_{R(\text{frame})}$	Rise time, output abe_pdm_frame		5		5	ns
	$t_{F(\text{frame})}$	Fall time, output abe_pdm_frame		5		5	ns

- (1) Related to the output clk maximum frequency.
- (2) $P = \text{output clk period in ns}$
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) The timing requirements are assured for the Jitter standard deviation and duty cycle error conditions specified.
- (5) See DM Operating Condition Addendum for CORE OPP voltages.

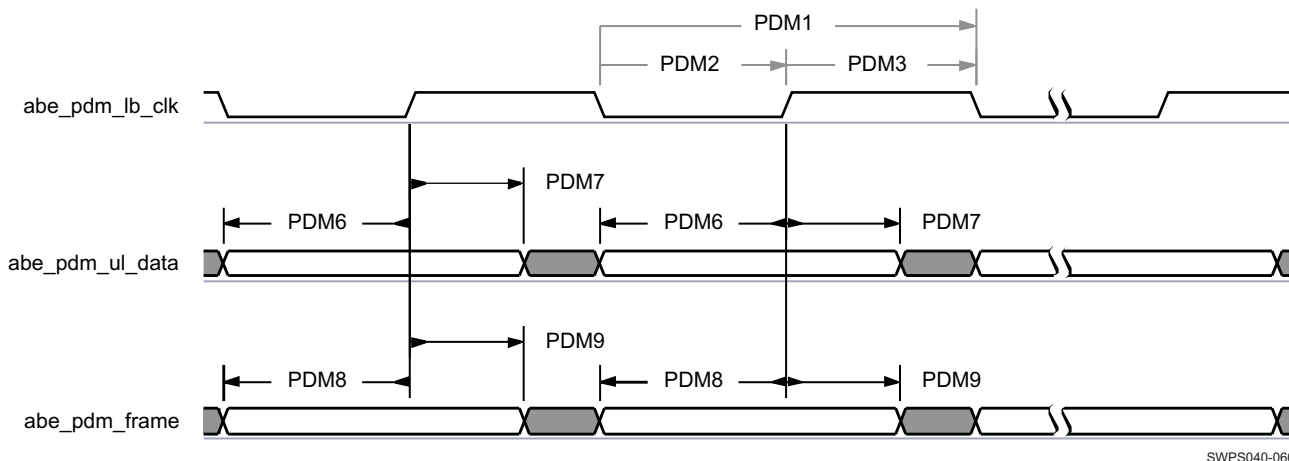

Figure 5-81. McPDM—Master Receive SDR Mode

5.6.6 SlimBus

NOTE

For more information, see the Serial Communication Interface / Serial Low-Power Inter-Chip Media Bus Controller section of the OMAP4470 TRM.

The SlimBus controller provides a bidirectional, multidrop, multichannel, two-line serial interface between the OMAP4470 chip and external components in a system such as audio codecs, *Bluetooth*® module, FM radio receiver/transmitter. It can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, PCM, TDM) due to its high level of versatility.

5.6.6.1 ABE SlimBus1, SlimBus2—SLIMBUS SDR 24.6 MHz

Table 5-110 and Table 5-111 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-82 and Figure 5-83).

Table 5-109. ABE SlimBus1, SlimBus2 Timing Conditions⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1.2		ps
t _F	Input signal fall time	1.2		ps
PCB Conditions				
	Number of external peripherals		3	
	Far end load		15	pF
	Trace length		10	cm
	Characteristic impedance	30	60	Ω

(1) IO settings: MB[1:0] = 11 and LB0 = 1.

- Balls: AC26 / AC25 / AG24 / AH24 (abe_slimbus1_clock, abe_slimbus1_data, slimbus2_clock, slimbus2_data)
For more information on IO settings, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- Corresponding voltage: 1.8 V.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:

Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-110. ABE SlimBus1, SlimBus2 Timing Requirements⁽⁴⁾⁽⁶⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SB1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ slimbusx_clock clock period		24.576		12.288	MHz
SB2	$t_{w(\text{clkH})}$	Typical pulse duration, slimbusx_clock clock low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns

5.6.7 High-Speed Synchronous Interface (HSI)

The MIPI high-speed synchronous serial interface (HSI) module is a multichannel and full duplex serial communications interface, composed of the HSI Transmitter (HSIT) in charge of the transmitted information and the HSI Receiver (HSIR) in charge of the received information. The HSI peripheral is used typically to enable OMAP to exchange information with an external modem. On the modem side, there is also a receiver and a transmitter.

5.6.7.1 High-Speed Synchronous Interface 1

5.6.7.1.1 HSI1 Transmit and Receive Modes—1.2 V

Table 5-116 and Table 5-117 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-86 and Figure 5-87).

Table 5-115. HSI1 Timing Conditions—Transmit and Receive Modes—1.2 V⁽¹⁾⁽²⁾⁽⁴⁾⁽⁵⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX

	Characteristic impedance	35	55	Ω

(1) IO settings: MB[1:0] = 11 (mode 3) and LB0 = 1.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) Minimize the number of vias by layer transitions.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).
Output load C_{LOAD} or Far end load equals to the total capacitance seen at the Far end of the transmission line.

(5) In transmit mode, series resistor is not necessary if the PCB conditions are within the range specified in this table and the overshoot is below 450 mV, but series resistor might be needed for more stringent overshoot specification or longer traces.

Table 5-116. HSI1 Timing Requirements—Receive Mode—1.2 V⁽¹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{c(data,flag)}$	Frequency, hsi_cadata, hsi_caflag		112		56	MHz
HSI1	$1 / t_{c(NomBit)}$	Frequency, nominal bit time	225		112		MHz
HSI2	$t_d(DAT-FLAG)$	Delay time, hsi_cadata transition to hsi_caflag transition	1.56		3.13		ns
	$t_d(FLAG-DAT)$	Delay time, hsi_caflag transition to hsi_cadata transition	1.56		3.13		ns
HSI3	$t_d(DAT)$	Duration time, hsi_cadata low level or high level duration	2.56		5.13		ns
	$t_d(FLAG)$	Duration time, hsi_caflag low level or high level duration	2.56		5.13		ns
HSI4	t_R	Rise time, hsi_cadata and hsi_caflag	1.0	1.30	1.0	1.30	ns
HSI5	t_F	Fall time, hsi_cadata and hsi_caflag	1.0	1.20	1.0	1.20	ns

(1) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-117. HSI1 Switching Characteristics—Transmit Mode—1.2 V⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{c(\text{data,flag})}$	Frequency, hsi_acdata, hsi_acflag		96		48	MHz
HSI1	$1 / t_{c(\text{NomBit})}$	Frequency, nominal bit time	192		96		MHz
HSI6	$t_{d(\text{DAT-FLAG})}$	Delay time, hsi_acdata transition to his_acflag transition	2.08	P + 0.98	4.17	P + 2.21	ns
	$t_{d(\text{FLAG-DAT})}$	Delay time, hsi_acflag transition to hsi_acdata transition	2.08	P + 0.98	4.17	P + 2.21	ns
HSI7	$t_{d(\text{DAT})}$	Duration time, hsi_acdata low level or high level duration	2.32	P + 1.18	4.42	P + 2.41	ns
	$t_{d(\text{FLAG})}$	Duration time, hsi_acflag low level or high level duration	2.32	P + 1.18	4.42	P + 2.41	ns
HSI8	t_R	Rise time, hsi_acdata and hsi_acflag	0.20	1.60	0.40	1.60	ns
HSI9	t_F	Fall time, hsi_acdata and hsi_acflag	0.20	1.40	0.30	1.40	ns

(1) P = $t_{c(\text{NomBit})}$ time in ns

(2) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.7.1.2 HSI1 Transmit and Receive Modes—1.8 V

Table 5-119 and Table 5-120 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-86 and Figure 5-87).

Table 5-118. HSI1 Timing Conditions—Transmit and Receive Modes—1.8 V⁽¹⁾⁽²⁾⁽⁴⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1000	1500	ps
t_F	Input signal fall time	1000	1300	ps
PCB Conditions⁽³⁾				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		4	cm
	Characteristic impedance	35	55	Ω

(1) IO settings: MB[1:0] = 11 (mode 3) and LB0 = 0.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) Minimize the number of vias by layer transitions.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).
Output load C_{LOAD} or Far end load equals to the total capacitance seen at the Far end of the transmission line.

(5) In transmit mode, series resistor is not necessary if the PCB conditions are within the range specified in this table and the overshoot is below 450 mV, but series resistor might be needed for more stringent overshoot specification or longer traces.

Table 5-119. HSI1 Timing Requirements—Receive Mode—1.8 V⁽¹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT

(1) P = $t_{c(NomBit)}$ time in ns

(2) See DM Operating Condition Addendum for CORE OPP voltages.

(3) See [Table 5-121](#) for additional data.

Table 5-121. HSI1 Additional Switching Characteristics—Transmit Mode—1.8 V—OPP100⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER		OPP100			UNIT
			MIN	NOM	MAX	
PCB Conditions						
	Trace length		1		4	cm
	Typical trace capacitance			1.34		pF/cm
	Far-end load		2		5	pF
Case 1						
	Series resistor			0		Ω
	Z_0 characteristic impedance		35		40	Ω
	Overshoot / Undershoot level at receiver				300	mV
HSI8	t_R	Rise time at receiver	0.48		1.61	ns
HSI9	t_F	Fall time at receiver	0.48		1.61	ns
Case 2						
	Series resistor			10		Ω
	Z_0 characteristic impedance		40		55	Ω

Table 5-121. HSI1 Additional Switching Characteristics—Transmit Mode—1.8 V—OPP100⁽¹⁾⁽²⁾⁽³⁾ (continued)

NO.	PARAMETER		OPP100			UNIT
			MIN	NOM	MAX	
	Overshoot / Undershoot level at receiver				270	mV
HSI8	t _R	Rise time at receiver	0.48		1.62	ns
HSI9	t _F	Fall time at receiver	0.48		1.62	ns
Case 3						
	Series resistor			15		Ω
	Z ₀ characteristic impedance		55		65	Ω
	Overshoot / Undershoot level at receiver				300	mV
HSI8	t _R	Rise time at receiver	0.47		1.48	ns
HSI9	t _F	Fall time at receiver	0.47		1.48	ns

(1) IO settings: MB[1:0] = 11 (mode 3) and LB0 = 0.

(2) In this table, the data apply to hsi1_acdata, hsi1_acflag, hsi1_acwake, hsi1_acready.

(3) In this table, the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.

5.6.7.2 High-Speed Synchronous Interface 2

5.6.7.2.1 HSI2 Transmit and Receive Modes—1.2 V

[Table 5-123](#) and [Table 5-124](#) assume testing over the recommended operating conditions and electrical characteristic conditions below (see [Figure 5-86](#) and [Figure 5-87](#)).

Table 5-122. HSI2 Timing Conditions—Transmit and Receive Modes—1.2 V⁽¹⁾⁽²⁾⁽⁴⁾⁽⁵⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1000	1100	ps
t _F	Input signal fall time	1000	1100	ps
PCB Conditions⁽³⁾				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		4	cm
	Characteristic impedance	35	50	Ω

(1) IO settings: DS0 = 1.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.

(3) Minimize the number of vias by layer transitions.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).
Output load C_{LOAD} or Far end load equals to the total capacitance seen at the Far end of the transmission line.

(5) In transmit mode, series resistor is not necessary if the PCB conditions are within the range specified in this table and the overshoot is below 450 mV, but series resistor might be needed for more stringent overshoot specification or longer traces.

HSI9	t_F	Fall time, hsi_acdata and hsi_acflag	0.20	1.40	0.30	1.40	ns

(1) P = $t_{c(NomBit)}$ time in ns

(2) See DM Operating Condition Addendum for CORE OPP voltages.

5.6.7.2.2 HSI2 Transmit and Receive Modes—1.8 V

Table 5-126 and Table 5-127 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-86 and Figure 5-87).

Table 5-125. HSI2 Timing Conditions—Transmit and Receive Modes—1.8 V⁽¹⁾⁽²⁾⁽⁴⁾⁽⁵⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1000	1300	ps
t_F	Input signal fall time	1000	1200	ps
PCB Conditions⁽³⁾				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		4	cm
	Characteristic impedance	35	50	Ω

- (1) IO settings: DS0 = 1.
For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.
- (3) Minimize the number of vias by layer transitions.
- (4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).
Output load C_{LOAD} or Far end load equals to the total capacitance seen at the Far end of the transmission line.
- (5) In transmit mode, the use of 15-Ω series resistor is recommended on hsi2_acdata (HSI2 APE to cellular modem data signal) and hsi2_acflag (HSI2 APE to cellular modem flag signal) in order to minimize overshoot, below 450 mV for the worst case of PCB conditions from this table.

Table 5-126. HSI2 Timing Requirements—Receive Mode—1.8 V⁽¹⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$1 / t_{c(\text{data,flag})}$	Frequency, hsi_cadata, hsi_caflag		112		56	MHz

HSI9	t_F	Fall time, hsi_acdata and hsi_acflag	0.20 ⁽³⁾	1.40 ⁽³⁾	0.30	1.40	ns

(1) P = $t_{c(\text{NomBit})}$ time in ns

(2) See DM Operating Condition Addendum for CORE OPP voltages.

(3) See [Table 5-128](#) for additional data.

Table 5-128. HSI2 Additional Switching Characteristics—Transmit Mode—1.8 V—OPP100⁽¹⁾⁽²⁾⁽³⁾

NO.	PARAMETER	OPP100			UNIT
		MIN	NOM	MAX	
PCB Conditions					
	Trace length	1		8	cm
	Typical trace capacitance		1.34		pF/cm
	Far-end load	2		5	pF
Case 1					
	Series resistor		35		Ω

Table 5-128. HSI2 Additional Switching Characteristics—Transmit Mode—1.8 V—OPP100⁽¹⁾⁽²⁾⁽³⁾ (continued)

NO.	PARAMETER		OPP100			UNIT
			MIN	NOM	MAX	
	Z ₀ characteristic impedance		30		60	Ω
	Overshoot / Undershoot level at receiver				220	mV
HSI8	t _R	Rise time at receiver	0.3		1.62	ns
HSI9	t _F	Fall time at receiver	0.3		1.62	ns

(1) IO settings: DS0 = 1

(2) In this table, the data apply to hsi2_acdata, hsi2_acflag, hsi2_acwake, hsi2_acready.

(3) In this table, the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

Figure 5-86. HSI1, 2 Interfaces—1.2 V and 1.8 V—Receive Mode⁽¹⁾⁽²⁾

(1) In hsix, x is equal to 1 or 2.

(2) The hsix_cadata signal always reflects the value being transmitted and the hsix_caflag signal only toggles when the bit value transmitted remains constant. Transmission of one bit is indicated by a transition on exactly one, and only one, of the two signals.

Figure 5-87. HSI1, 2 Interfaces—1.2 V and 1.8 V—Transmit Mode⁽¹⁾⁽²⁾

- (1) In hsix, x is equal to 1 or 2.
- (2) The hsix_acdata signal always reflects the value being transmitted and the hsix_acflag signal only toggles when the bit value transmitted remains constant. Transmission of one bit is indicated by a transition on exactly one, and only one, of the two signals.

5.6.8 Universal Serial Bus (USB)

5.6.8.1 Universal Serial Bus (USB)—USBA0

NOTE

For more information, see the Serial Communication Interface / High-Speed USB OTG Controller section of the OMAP4470 TRM.

5.6.8.1.1 High-Speed USBA0 (HSUSB)—USB HS OTG PHY

The USB HS OTG PHY module fits the High-speed Signaling Eye Patterns and Rise and Fall Time of the USB specification Revision 2.0, provided the PCB guidelines are followed (for more information on the PCB guidelines, see [Section A](#), *OMAP4470 Processor Multimedia Device PCB Guideline*). For more information on the High-speed Signaling Eye Patterns and Rise and Fall Time, see the Electrical / Signaling / Data Signal Rise and Fall, Eye Patterns / High-speed Signaling Eye Patterns and Rise and Fall Time section of the USB specification Revision 2.0:

- For USB HS transmit waveform requirements, see Figure 7-13 (Template 1).
- For USB HS receiver sensitivity waveform requirements, see Figure 7-16 (Template 4).

5.6.8.1.2 High-Speed USBA0 (HSUSB)—ULPI SDR—Slave Mode

[Table 5-130](#) and [Table 5-131](#) assume testing over the recommended operating conditions and electrical characteristic conditions below (see [Figure 5-88](#)).

Table 5-129. High-Speed USB USBA0 Timing Conditions—ULPI SDR—Slave Mode—1.8 V⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	1.00	3.00	ns
t _F	Input signal fall time	1.00	3.00	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		5	cm
	Characteristic impedance	30	60	Ω

- (1) IO settings configuration: DS0 = 0
Corresponding voltage: 1.8 V
For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.
- (2) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see [Table 2-1](#), POWER [9] column with the ball name.
- (3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

5.6.8.2 Universal Serial Bus (USB)—USB1

NOTE

For more information, see the Serial Communication Interface / High-Speed Multiport USB Host Subsystem section of the OMAP4470 TRM.

5.6.8.2.1 Low- / Full-Speed USB1 (FSUSB)—Bidirectional Standard 4-pin Mode

Table 5-133 and Table 5-134 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-89).

Table 5-132. Low- / Full-Speed USB1 Timing Conditions—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	2		ns
t _F	Input signal fall time	2		ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		10	pF
	Trace length		10	cm
	Characteristic impedance	30	60	Ω

(1) IO settings:

- usbb1_mm_txen (ball AF18): MB[1:0] = 10, LB0 = 1
- usbb1_mm_txdat (ball AG18): MB[1:0] = 10, LB0 = 1
- usbb1_mm_txse0 (ball AE17): MB[1:0] = 10, LB0 = 1
- usbb1_mm_rxcv (ball AF17): MB[1:0] = 10, LB0 = 1

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / Low Speed I/Os Combined Slew Rate vs TL Length and Load Settings section of the OMAP4470 TRM.

- Corresponding voltage: 1.8 V

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-133. Low- / Full-Speed USB1 Timing Requirements—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
FSU10	t _{d(DAT,SE0)}	Time duration, usbb1_mm_txdat and usbb1_mm_txse0 low together during transition		14.0		14.0	ns
FSU11	t _{d(DAT,SE0)}	Time duration, usbb1_mm_txdat and usbb1_mm_txse0 high together during transition		8.0		8.0	ns
FSU12	t _{d(RCVU0)}	Time duration, usbb1_mm_rxcv undefined during a Single End 0 (usbb1_mm_txdat and usbb1_mm_txse0 low together)		14.0		14.0	ns
FSU13	t _{d(RCVU1)}	Time duration, usbb1_mm_rxcv undefined during a Single End 1 (usbb1_mm_txdat and usbb1_mm_txse0 high together)		8.0		8.0	ns

- (1) See DM Operating Condition Addendum for CORE OPP voltages.
- (2) Low-Speed mode is a subset of the Full-Speed mode and it is expected to work at low bandwidth (1.5Mb/s).

Table 5-134. Low- / Full-Speed USBB1 Switching Characteristics—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾

UT3	$t_{w(\text{clkL})}$	Typical pulse duration, output usbb1_ulpitll_clk low	0.5*P ⁽²⁾		0.5*P ⁽²⁾		ns
	$t_{dc(\text{clk})}$	Duty cycle error, output usbb1_ulpitll_clk	-833	833	-833	833	ps
	$t_{j(\text{clk})}$	Jitter standard deviation ⁽³⁾ , output usbb1_ulpitll_clk		400		400	ps
	$t_{R(\text{clk})}$	Rising time, output usbb1_ulpitll_clk		3.0		3.0	ps
	$t_{F(\text{clk})}$	Falling time, output usbb1_ulpitll_clk		3.0		3.0	ps
UT8	$t_{d(\text{clkL-ctrlV})}$	Delay time, output usbb1_ulpitll_clk rising edge to output usbb1_ulpitll_dir and usbb1_ulpitll_nxt	0.04	8.96	0.04	8.96	ns
	$t_{R(\text{ctrl})}$	Rising time, output usbb1_ulpitll_dir and usbb1_ulpitll_nxt		3.0		3.0	ps
	$t_{F(\text{ctrl})}$	Falling time, output usbb1_ulpitll_dir and usbb1_ulpitll_nxt		3.0		3.0	ps
UT9	$t_{d(\text{clkL-doV})}$	Delay time, output usbb1_ulpitll_clk rising edge to output usbb1_ulpitll_dat[7:0] valid	0.04	8.96	0.04	8.96	ns
	$t_{R(\text{do})}$	Rising time, output usbb1_ulpitll_dat[7:0]		3.0		3.0	ps
	$t_{F(\text{do})}$	Falling time, output usbb1_ulpitll_dat[7:0]		3.0		3.0	ps

(1) Related to the input maximum frequency supported by the USB module.

(2) P = output clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) See DM Operating Condition Addendum for CORE OPP voltages.

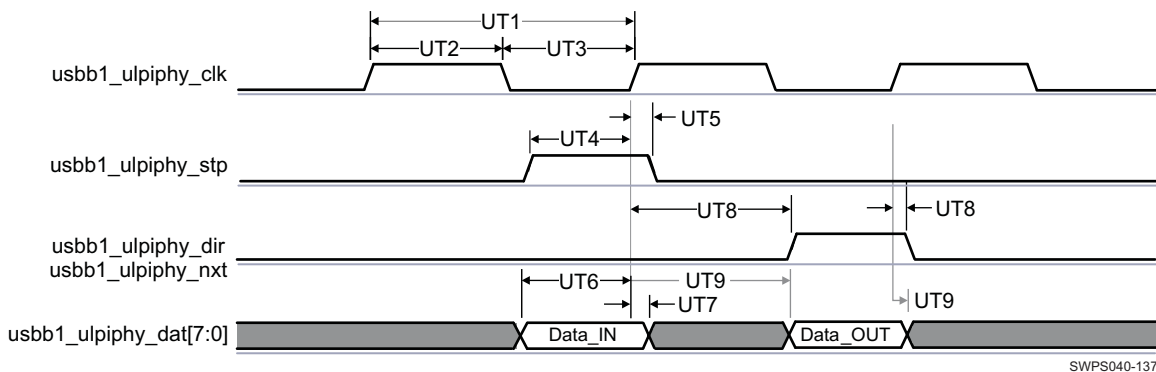

Figure 5-94. High-Speed USBB1—ULPI TLL Mode—Master Mode—1.8 V

5.6.8.2.7 High-Speed USBB1 (HSUSB)—High-Speed InterChip Interface 1 (HSIC1)

High-Speed InterChip (HSIC) is an alternative to the standard USB physical layer targeted at fixed, inter-chip communications. This implies short distances between devices, and allows for simpler, smaller, more power-efficient PHYs over a single-ended, 2-wire interface running at a fixed HS speed. HSIC must be identical to standard USB from a high-level application standpoint.

5.6.8.2.7.1 High-Speed USBB1—HSIC DDR Receive And Transmit Modes—1.2 V

Table 5-151 and Table 5-152 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-95).

Table 5-150. High-Speed USBB1—HSIC DDR Timing Conditions—1.2 V⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	0.29	0.58	ns
t_F	Input signal fall time	0.29	0.58	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		4	cm
	Characteristic impedance	45	55	Ω

(1) IO settings:

- usbb1_hsic_data, usbb1_hsic_strobe (Balls AF14 / AE14): sr[1:0] = 10 and i[2:0] = 110
For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / High-speed I/O Buffers with Impedance, Slew Rate and Weak Driver Settings section of OMAP4470 TRM.
- Corresponding voltage: 1.2 V

(2) In this table the rise and fall times are calculated for 30% to 70% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-151. High-Speed USBB1 Timing Requirements—HSIC DDR Receive Mode—1.2 V⁽³⁾

NO.	PARAMETER		OPP100, OPP119		UNIT
			MIN	MAX	
HSIC1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , usbb1_hsic_strobe period		240	MHz
HSIC2	$t_{w(\text{clkH})}$	Typical pulse duration, usbb1_hsic_strobe high	0.5*P ⁽²⁾		ns
HSIC3	$t_{w(\text{clkL})}$	Typical pulse duration, usbb1_hsic_strobe low	0.5*P ⁽²⁾		ns
HSIC5	$t_{su(\text{strobe-dataV})}$	Setup time, usbb1_hsic_data valid before usbb1_hsic_strobe low/high	0.271		ns
HSIC6	$t_{h(\text{strobe-dataV})}$	Hold time, usbb1_hsic_data valid after usbb1_hsic_strobe low/high	0.271		ns

(1) Related to the maximum USB HSIC frequency.

(2) P = input clock period in ns

(3) See DM Operating Condition Addendum for CORE OPP voltages.

Table 5-152. High-Speed USBB1 Switching Characteristics—HSIC DDR Transmit Mode—1.2 V⁽³⁾

NO.	PARAMETER		OPP100, OPP119		UNIT
			MIN	MAX	
HSIC1	$1 / t_{c(\text{clk})}$	Frequency ⁽¹⁾ , usbb1_hsic_strobe period		240	MHz
HSIC2	$t_{w(\text{clkH})}$	Typical pulse duration, usbb1_hsic_strobe high	0.5*P ⁽²⁾		ns
HSIC3	$t_{w(\text{clkL})}$	Typical pulse duration, usbb1_hsic_strobe low	0.5*P ⁽²⁾		ns
	$t_{dc(\text{clk})}$	Duty cycle error, usbb1_hsic_strobe	–83	83	ps
	$t_R(\text{clk})$	Rise time, usbb1_hsic_strobe	0.39	0.56	ns
	$t_F(\text{clk})$	Fall time, usbb1_hsic_strobe	0.39	0.56	ns
HSIC4	$t_d(\text{clk-dataV})$	Delay time, usbb1_hsic_strobe low/high to usbb1_hsic_data valid	–0.325	0.325	ns
	$t_R(\text{do})$	Rise time, output data usbb1_hsic_data	0.39	0.56	ns
	$t_F(\text{do})$	Fall time, output data usbb1_hsic_data	0.39	0.56	ns

- (1) Related to the maximum USB HSIC frequency.
- (2) P = output clock period in ns
- (3) See DM Operating Condition Addendum for CORE OPP voltages.

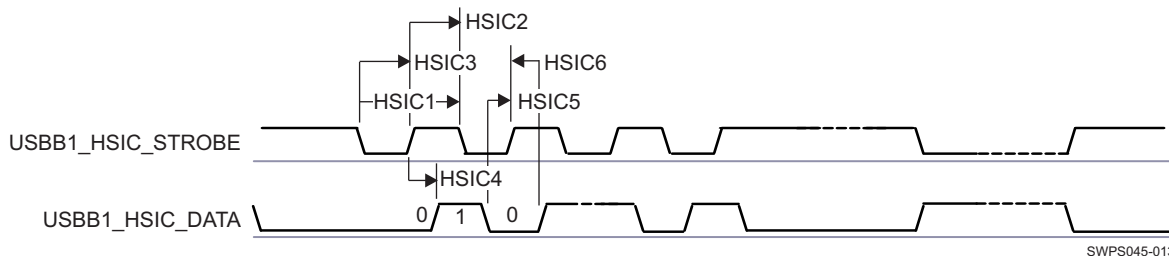

Figure 5-95. High-Speed USB B1—HSIC DDR Receive And Transmit Modes—1.2 V

5.6.8.3 Universal Serial Bus (USB)—USB B2

NOTE

For more information, see the Serial Communication Interface / High-Speed Multiport USB Host Subsystem section of the OMAP4470 TRM.

5.6.8.3.1 Low- / Full-Speed USB B2 (FSUSB)—Bidirectional Standard 4-pin Mode

Table 5-154 and Table 5-155 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-96).

Table 5-153. Low- / Full-Speed USB B2 Timing Conditions—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾⁽³⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time	2		ns
t _F	Input signal fall time	2		ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		10	pF
	Trace length		10	cm
	Characteristic impedance	30	60	Ω

(1) IO settings:

- usbb2_mm_txen (ball AC28): MB[1:0] = 10, LB0 = 1
- usbb2_mm_txdat (ball AF24): MB[1:0] = 10, LB0 = 1
- usbb2_mm_txse0 (ball AE24): MB[1:0] = 10, LB0 = 1
- usbb2_mm_rxcv (ball AD25): MB[1:0] = 10, LB0 = 1

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50-Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.

- Corresponding voltage: 1.8 V

(2) In this table the rise and fall times are calculated for 10% to 90% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(3) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-154. Low- / Full-Speed USBB2 Timing Requirements—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
FSU10	$t_{d(DAT,SE0)}$	Time duration, usbb2_mm_txdat and usbb2_mm_txse0 low together during transition		14.0		14.0	ns
FSU11	$t_{d(DAT,SE0)}$	Time duration, usbb2_mm_txdat and usbb2_mm_txse0 high together during transition		8.0		8.0	ns
FSU12	$t_{d(RCVU0)}$	Time duration, usbb2_mm_rxrcv undefined during a Single End 0 (usbb2_mm_txdat and usbb2_mm_txse0 low together)		14.0		14.0	ns
FSU13	$t_{d(RCVU1)}$	Time duration, usbb2_mm_rxrcv undefined during a Single End 1 (usbb2_mm_txdat and usbb2_mm_txse0 high together)		8.0		8.0	ns

(1) See DM Operating Condition Addendum for CORE OPP voltages.

(2) Low-Speed mode is a subset of the Full-Speed mode and it is expected to work at low bandwidth (1.5Mb/s).

Table 5-155. Low- / Full-Speed USBB2 Switching Characteristics—Bidirectional Standard 4-pin Mode—1.8 V⁽¹⁾⁽²⁾

- (1) Related to the input maximum frequency supported by the USB module.
- (2) P = output clk period in ns
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) See DM Operating Condition Addendum for CORE OPP voltages.

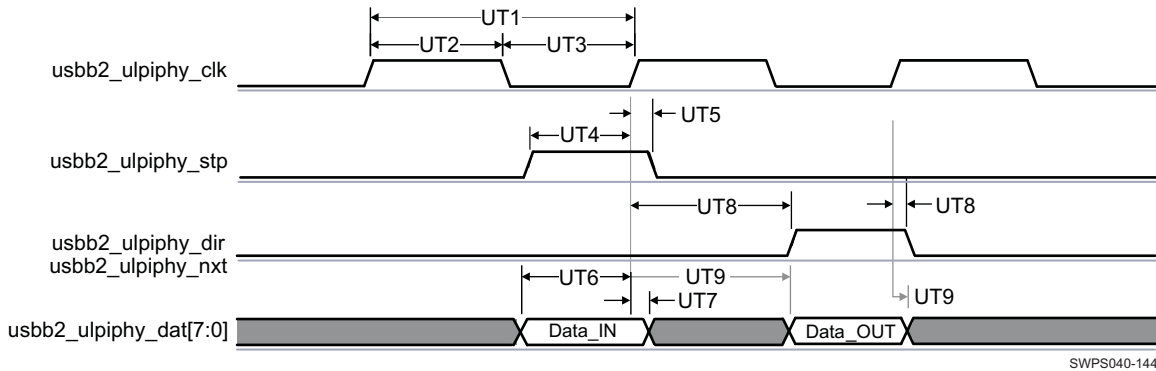

Figure 5-102. High-Speed USB2—ULPI TLL Mode—Master Mode

5.6.8.3.8 High-Speed USB2 (HSUSB)—High-Speed InterChip Interface 2 (HSIC2)

High-Speed InterChip (HSIC) is an alternative to the standard USB physical layer targeted at fixed, inter-chip communications. This implies short distances between devices, and allows for simpler, smaller, more power-efficient PHYs over a single-ended, 2-wire interface running at a fixed HS speed. HSIC should be identical to standard USB from a high-level application standpoint.

5.6.8.3.8.1 High-Speed USB2—HSIC DDR Receive And Transmit Modes—1.2 V

Table 5-174 and Table 5-175 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-103).

Table 5-173. High-Speed USB2—HSIC DDR Timing Conditions—1.2 V⁽¹⁾⁽²⁾⁽³⁾

SYSTEM CONDITION PARAMETER		VALUE		UNIT

	$t_{F(\text{do})}$	Fall time, output data usbb2_hsic_data	0.39	0.56	ns

(1) Related to the maximum USB HSIC frequency.

(2) P = output clock period in ns

(3) See DM Operating Condition Addendum for CORE OPP voltages.

**Figure 5-103. High-Speed USB2—HSIC DDR Receive And Transmit Modes—1.2 V**

5.6.9 Inter-Integrated Circuit Interface (I²C)

NOTE

For more information, see the Serial Communication Interface / Multimaster High-Speed I²C Controller / HS I²C Functional Description section of the OMAP4470 TRM.

The multi-master I²C peripheral provides an interface between two or more devices via an I²C serial bus. The I²C controller supports the multi-master mode which allows more than one device capable of controlling the bus to be connected to it. Each I²C device is recognized by a unique address and can operate as either transmitter or receiver, according to the function of the device. In addition to being a transmitter or receiver, a device connected to the I²C bus can also be considered as master or slave when performing data transfers. This data transfer is carried out via two serial bidirectional wires:

- An SDA data line
- An SCL clock line

In [Figure 5-104](#) and [Figure 5-105](#) the data transfer is in master or slave configuration with 7-bit addressing format.

The I²C and SmartReflex interfaces are compliant with Philips I²C specification version 2.1. It supports standard mode (up to 100K bits/s), fast mode (up to 400K bits/s), and high-speed mode (up to 3.4Mb/s).

5.6.9.1 I²C and SmartReflex—Standard and Fast Modes

NOTE

PCB conditions:

- Far End Load is less than 30 pF: for more information regarding LB1, LB0 Far End Load IO settings, see Control Module / Control Module Functional Description/ Functional Register Description / I2Cx I/Os Group Pullupresx Controls and Load Range Settings section of OMAP4470 TRM.
- Maximum trace length is less than 20 cm.
- Characteristic impedance is between 20 Ω to 70 Ω.

Table 5-176. I²C and SmartReflex—Standard and Fast Modes⁽⁶⁾

NO.	PARAMETER		STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
	f_{scl}	Frequency, clock i2cx_scl ⁽⁴⁾		100		400	kHz
I1	$t_{w(sclH)}$	Pulse duration, clock i2cx_scl ⁽⁴⁾ high	4.0		0.6		μs
I2	$t_{w(sclL)}$	Pulse duration, clock i2cx_scl ⁽⁴⁾ low	4.7		1.3		μs
I3	$t_{su(sdaV-sclH)}$	Setup time, data i2cx_sda ⁽⁴⁾ valid before clock i2cx_scl ⁽⁴⁾ active level	250		100 ⁽¹⁾		ns
I4	$t_{h(sclH-sdaV)}$	Hold time, data i2cx_sda ⁽⁴⁾ valid after clock i2cx_scl ⁽⁴⁾ active level	0 ⁽²⁾	3.45 ⁽³⁾	0 ⁽²⁾	0.9 ⁽³⁾	μs
I5	$t_{su(sclH-sdaL)}$	Setup time, clock i2cx_scl ⁽⁴⁾ high before data i2cx_sda ⁽⁴⁾ low (for a START ⁽⁵⁾ condition or a repeated START condition)	4.7		0.6		μs
I6	$t_{h(sdaL-sclH)}$	Hold time, clock i2cx_scl ⁽⁴⁾ high after data i2cx_sda ⁽⁴⁾ low (for a START ⁽⁵⁾ condition or a repeated START condition)	4.0		0.6		μs
I7	$t_{su(sclH-sdaH)}$	Setup time, clock i2cx_scl ⁽⁴⁾ high before data i2cx_sda ⁽⁴⁾ high (for a STOP condition)	4.0		0.6		μs
I8	$t_{w(sdaH)}$	Pulse duration, data i2cx_sda ⁽⁴⁾ high between STOP and START conditions	4.7		1.3		μs
	$t_{R(scl)}$	Rise time, clock i2cx_scl ⁽⁴⁾		1000	20 + 0.1C _B	300	ns
	$t_{F(scl)}$	Fall time, clock i2cx_scl ⁽⁴⁾		300	20 + 0.1C _B	300	ns
	$t_{R(sda)}$	Rise time, data i2cx_sda ⁽⁴⁾		1000	20 + 0.1C _B	300	ns
	$t_{F(sda)}$	Fall time, data i2cx_sda ⁽⁴⁾		300	20 + 0.1C _B	300	ns
	C _B	Capacitive load for each bus line		400		400	pF

(1) A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{su(SDAV-SCLH)} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the low period of the i2cx_scl⁽⁴⁾. If such a device does stretch the low period of the i2cx_scl⁽⁴⁾, it must output the next data bit to the i2cx_sda⁽⁴⁾ line $t_{R(SDA)} \text{ MAX} + t_{su(SDAV-SCLH)} = 1000 + 250 = 1250$ ns (according to the standard-mode I²C-bus specification) before the i2cx_scl⁽⁴⁾ line is released.

(2) The device provides (via the I²C bus) a minimum hold time (= I2C_FCLK period x (PSC+1) x 4) for the i2cx_sda⁽⁴⁾ signal (refer to the fall and rise times of i2cx_scl⁽⁴⁾) to bridge the undefined region of the falling edge of i2cx_scl⁽⁴⁾.
For more information, see the Serial Communication Interface / Multimaster High-Speed I²C Controller / HS I²C Functional Description /

HS I²C Clocks section of the OMAP4470 TRM.

- (3) The maximum $t_{h(SCLH-SDA)}$ has only to be met if the device does not stretch the low period of the $i2cx_scl^{(4)}$ signal.
- (4) In $i2cx$, x is equal to 1, 2, 3, or 4, or sr for SmartReflex. sr (SmartReflex) is master transmitter only.
- (5) After this time, the first clock is generated.
- (6) In this table the rise and fall times are calculated for 30% to 70% of V_{DD5} . For more information on the corresponding OMAP4 V_{DD5} power supply name, see [Table 2-1, POWER \[9\]](#) column with the ball name.

Figure 5-104. I²C and SmartReflex—Standard and Fast Modes⁽¹⁾

- (1) In $i2cX$, X is equal to 1, 2, 3 or 4, or sr for SmartReflex.

5.6.9.2 I²C and SmartReflex—High-Speed Mode

NOTE

PCB conditions:

- Far End Load is less than 30 pF: for more information regarding LB1, LB0 Far End Load IO settings, see Control Module / Control Module Functional Description/ Functional Register Description / I2Cx I/Os Group Pullupresx Controls and Load Range Settings section of OMAP4470 TRM.
- Maximum trace length is less than 20 cm.
- Characteristic impedance is between 20 Ω to 70 Ω .

Table 5-177. I²C and SmartReflex—High-Speed Mode⁽⁶⁾

NO.	PARAMETER		MIN	MAX	UNIT
	f_{scl}	Frequency, clock $i2cx_scl^{(3)}$		3.4 ⁽⁵⁾	MHz
IH1	$t_{w(sclH)}$	Pulse duration, clock $i2cx_scl^{(3)}$ high	60 ⁽¹⁾		ns
IH2	$t_{w(sclL)}$	Pulse duration, clock $i2cx_scl^{(3)}$ low	160 ⁽¹⁾		ns
IH3	$t_{su(sdaV-sclH)}$	Setup time, data $i2cx_sda^{(3)}$ valid before clock $i2cx_scl^{(3)}$ active level	10		ns
IH4	$t_{h(sclH-sdaV)}$	Hold time, data $i2cx_sda^{(3)}$ valid after clock $i2cx_scl^{(3)}$ active level	0 ⁽⁴⁾	70	ns
IH5	$t_{su(sclH-sdaL)}$	Setup time, clock $i2cx_scl^{(3)}$ high before data $i2cx_sda^{(3)}$ low (for a START ⁽²⁾ condition or a repeated START condition)	160		ns
IH6	$t_{h(sdaL-sclH)}$	Hold time, clock $i2cx_scl^{(3)}$ high after data $i2cx_sda^{(3)}$ low (for a START ⁽²⁾ condition or a repeated START condition)	160		ns
IH7	$t_{su(sclH-sdaH)}$	Setup time, clock $i2cx_scl^{(3)}$ high before data $i2cx_sda^{(3)}$ high (for a STOP condition)	160		ns
	$t_{R(scl)}$	Rise time, clock $i2cx_scl^{(3)}$	10	40	ns
	$t_{R(scl)}$	Rise time, clock $i2cx_scl^{(3)}$ after a repeated START condition and after a bit acknowledge	10	80	ns
	$t_{F(scl)}$	Fall time, clock $i2cx_scl^{(3)}$	10	40	ns
	$t_{R(sda)}$	Rise time, data $i2cx_sda^{(3)}$	10	80	ns
	$t_{F(sda)}$	Fall time, data $i2cx_sda^{(3)}$	10	80	ns
	C_B	Capacitive load for each bus line		100	pF

- (1) HS-mode master devices generate a serial clock signal with a high to low ratio of 1 to 2. $t_{w(scl)} > 2 * t_{w(sclH)}$.
- (2) After this time, the first clock is generated.
- (3) In i2cx, x is equal to 1, 2, 3, or 4 or sr for SmartReflex. sr (SmartReflex) is master transmitter only.
- (4) The device provides (via the I²C bus) a minimum hold time (= I2C_FCLK period x 4) for the i2cx_sda⁽³⁾ signal (refer to the fall and rise times of i2cx_scl⁽³⁾) to bridge the undefined region of the falling edge of i2cx_scl⁽³⁾.
For more information, see the Serial Communication Interface / Multimaster High-Speed I²C Controller / HS I²C Functional Description / HS I²C Clocks section of the OMAP4470 TRM.
- (5) The maximum I2C5 (or SmartReflex) clock frequency in high-speed mode is equal to the SYS_CLK clock frequency (38.4 MHz maximum) divided by 18, with LB[1:0] = 01 setting on sr_scl (ball AG9, load range = 12 pF to 25 pF and internal pullup resistance = 920 Ω). Therefore, the maximum I2C5 (or SmartReflex) clock frequency in high-speed mode is 2.13 MHz.
For more information about the I2C5 (or SmartReflex) timings constraints calculation and the corresponding I2C5 registers settings, see the Serial Communication Interface / Multimaster High-Speed I²C Controller / HS I²C Functional Description / HS I²C Clocks section of the OMAP4470 TRM.
For more information on the LB0[1:0] IO cell configuration, see the Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers With Pad Group Assignment section of the OMAP4470 TRM.
- (6) In this table the rise and fall times are calculated for 30% to 70% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

Figure 5-105. I²C and SmartReflex—High-Speed Mode⁽¹⁾

- (1) In i2cX, X is equal to 1, 2, 3 or 4, or sr for SmartReflex.

5.6.10 HDQ / 1-Wire Interface (HDQ/1-Wire)

NOTE

For more information, see the Serial Communication Interface section of the OMAP4470 TRM.

The module is intended to work with both HDQ and 1-Wire protocols. The protocols use a single wire to communicate between the master and the slave. The protocols employ an asynchronous return to one mechanism where, after any command, the line is pulled high.

5.6.10.1 HDQ / 1-Wire—HDQ Mode

Table 5-179 through Table 5-181 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-106 through Figure 5-110).

Table 5-179. HDQ/1-Wire Timing Requirements—HDQ Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_{CYCH}	Read bit window timing	190		250	μs
t_{HW1}	Read one data valid after HDQ low	32 ⁽²⁾		66 ⁽²⁾	
t_{HW0}	Read zero data hold after HDQ low	70 ⁽²⁾		145 ⁽²⁾	
t_{RSPS}	Response time from HDQ slave device ⁽¹⁾	190		320	

(1) Defined by software.

(2) If HDQ slave device drives a logic-low state after t_{HW0} maximum, it can be interpreted as a break pulse. For more information see [Table 5-181](#) and the HDQ/1-Wire chapter of the OMAP4470 TRM.

Table 5-180. HDQ Sampling Cases⁽¹⁾

CASES	FIRST SAMPLING (at 68 μs)	SECOND SAMPLING (at 180 μs)
1	L (logic-low state)	L (logic-low state)
2	L (logic-low state)	H (logic-high state)
3	H (logic-high state)	L (logic-low state)
4	H (logic-high state)	H (logic-high state)

(1) The different cases can be interpreted as follows:

- Case 1: If a logic-low state is present at the first sampling time and also at the second sampling time, the receive data can be interpreted as a break pulse.
- Case 2: If a logic-low state is present at the first sampling time and a logic-high state is present at the second sampling time, the receive data on the line is a zero (data).
- Case 3: Undefined.
- Case 4: If a logic-high state is present at the first sampling time and also at the second sampling time, the receive data on the line is a one (data).

Table 5-181. HDQ/1-Wire Switching Characteristics—HDQ Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_B	Break timing	190			μs
t_{BR}	Break recovery time	40			
t_{CYCD}	Write bit windows timing	190			
t_{DW1}	Write one data valid after HDQ low	0.5		50	
t_{DW0}	Write zero data hold after HDQ low	86		145

5.6.10.2 HDQ/1-Wire—1-Wire Mode

Table 5-182 and Table 5-183 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-111 through Figure 5-114).

Table 5-182. HDQ/1-Wire Timing Requirements—1-Wire Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t _{PDH}	Presence pulse delay high	15		60	μs
t _{PDL}	Presence pulse delay low	60		240	
t _{RDV}	Read data valid time	t _{LOWR}		15	
t _{REL}	Read data release time	0		45	

Table 5-183. HDQ/1-Wire Switching Characteristics—1-Wire Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t _{RSTL}	Reset time low	480		960	μs
t _{RSTH}	Reset time high	480			μs
t _{SLOT}	Bit cycle time	60		120	μs
t _{LOW1}	Write bit-one time	1		15	μs
t _{LOW0}	Write bit-zero time ⁽²⁾	60		120	μs
t _{REC}	Recovery time	1			μs
t _{LOWR}	Read bit strobe time ⁽¹⁾	1		15	μs

- (1) t_{LOWR} (low pulse sent by the master) must be short as possible to maximize the master sampling window.
- (2) t_{LOW0} must be less than t_{SLOT} .

Figure 5-114. 1-Wire—Write Bit-Zero Timing (Command / Address or Data)

5.6.11 Universal Asynchronous Receiver Transmitter (UART)

NOTE

PCB conditions:

- Far End Load is less than 5 pF: for more information on the UART IO Settings, see [Table 5-184](#).
- Maximum trace length is less than 10 cm.
- Characteristic impedance is between 20 Ω to 70 Ω .

(1) Output transition time measured between 10% to 90% of PAD voltage

(2) Depending on the programming mode, different output load and transition time are available following the targeted maximum frequency, transmission line or output transition time.

(3) Output transition time measured between 20% to 70% of PAD voltage.

(4) Output transition time measured between 20% to 80% of PAD voltage.

5.6.11.1 UART3 IrDA

NOTE

For more information, see the Serial Communication Interface section of the OMAP4470 TRM.

The IrDA module can operate in three different modes:

- Slow infrared (SIR) (≤ 115.2 Kbits/s)
- Medium infrared (MIR) (0.576 Mbits/s and 1.152 Mbits/s)
- Fast infrared (FIR) (4 Mbits/s)

Figure 5-115. UART IrDA Pulse Parameters

5.6.11.1.1 UART3 IrDA—Receive Mode

Table 5-186. UART3 IrDA Signaling Rate and Pulse Duration with 3/16th Encoding—Receive Mode

SIGNALING RATE	ELECTRICAL PULSE DURATION			UNIT
	MIN	TYP	MAX	
SIR				
2.4 Kbit/s	52.17	78.13	208.33	μs
9.6 Kbit/s	13.10	19.53	52.08	μs
19.2 Kbit/s	6.59	9.77	26.04	μs
38.4 Kbit/s	3.34	4.88	13.02	μs
57.6 Kbit/s	2.25	3.26	8.68	μs
115.2 Kbit/s	1.17	1.63	4.34	μs
MIR				
0.576 Mbit/s	300.55	416.67	867.86	ns
1.152 Mbit/s	192.04	208.33	433.83	ns
FIR				
4.0 Mbit/s (Single pulse)	62.70	125.00	170.63	ns
4.0 Mbit/s (Double pulse)	208.53	250.00	291.47	ns

NOTE

In SIR receive mode, both the 3/16th and the 1.6-μs pulse duration methods are supported. For more information, see the Serial Communication Interface / UART/IrDA/CIR section of the OMAP4470 TRM.

Table 5-187. UART3 IrDA Rise and Fall Times—Receive Mode

PARAMETER		MIN	TYP	MAX	UNIT
t_R	Rise time, input data uart3_rx_irrx			200	ns
t_F	Fall time, input data uart3_rx_irrx			200	ns

5.6.11.1.2 UART3 IrDA—Transmit Mode
Table 5-188. UART3 IrDA Signaling Rate and Pulse Duration with 3/16th Encoding—Transmit Mode

SIGNALING RATE	ELECTRICAL PULSE DURATION			UNIT
	MIN	TYP	MAX	
SIR				
2.4 Kbit/s	78.1	78.1	78.1	μs
9.6 Kbit/s	19.5	19.5	19.5	μs
19.2 Kbit/s	9.75	9.75	9.75	μs
38.4 Kbit/s	4.87	4.87	4.87	μs
57.6 Kbit/s	3.25	3.25	3.25	μs
115.2 Kbit/s	1.62	1.62	1.62	μs
MIR				
0.576 Mbit/s	414	416	419	ns
1.152 Mbit/s	206	208	211	ns
FIR				
4.0 Mbit/s (Single pulse)	123	125	128	ns
4.0 Mbit/s (Double pulse)	248	250	253	ns

NOTE

In SIR transmit mode, both the 3/16th and the 1.6-μs pulse duration methods are supported. For more information, see the Serial Communication Interface / UART/IrDA/CIR section of the OMAP4470 TRM.

5.7 Removable Media Interfaces

NOTE

For more information, see the MMC/SD/SDIO section of the OMAP4470 TRM.

The MMC/SD/SDIO host controller provides an interface to MMC, SD memory cards or SDIO cards. The MMC/SD/SDIO host controller deals with MMC/SD/SDIO protocol at transmission level, data packing, adding cyclic redundancy checks (CRC), start/end bit, and checking for syntactical correctness.

There are five MMC/SD/SDIO host controllers inside the device:

- MMC/SD/SDIO1:
 - 1.8-V and 3-V support
 - 1-bit, 4-bit, and 8-bit data transfers without external transceiver
- MMC/SD/SDIO2:
 - Only 1.8-V support
 - 1-bit, 4-bit, and 8-bit data transfers without external transceiver
 - 8-bit with external transceiver allowing supporting 3-V peripherals
- MMC/SD/SDIO3, MMC/SD/SDIO4, and MMC/SD/SDIO5:
 - Only 1.8-V support
 - 1-bit and 4-bit data transfers without external transceiver

5.7.1 Multimedia Memory Card and Secure Digital IO Card (SDMMC)

5.7.1.1 MMC/SD/SDIO 1 Interface

5.7.1.1.1 MMC/SD/SDIO 1 Interface—SD Identification and Standard SD Mode

Table 5-190 and Table 5-191 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-116 and Figure 5-117).

Table 5-189. MMC/SD/SDIO 1 Interface Timing Conditions—SD Identification and Standard SD Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

TIMING CONDITION PARAMETER		VALUE		UNIT	
		MIN	MAX		
Input Conditions					
t_R	Input signal rise time	10		ns	
t_F	Input signal fall time	10		ns	
PCB Conditions					
	Number of external peripherals		1		
	Far end load		40	pF	
	Trace length for SD car types		10	cm	
	Characteristic impedance	SanDisk Extreme III cards	45	55	Ω
		Other card types	20	70	

(1) IO settings: SPEEDCTRL = 0

For more information, see

- The Control Module Functional Description / Extended-Drain I/O and PBIAS Cell / Extended-Drain I/O section or
- The Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / Device Interfaces Signal Group Controls Mapping section of the OMAP4470 TRM.

(2) In this table the rise and fall times are calculated for the V_{IL} / V_{IH} described in Section 3.3.11, MMC/SDIO DC Electrical Characteristics.

(3) For more information on SDMMC ESD guideline examples, see Section A.3.2.2.1, ESD Implementation—MMC/SD/SDIO 1 Interface—SD Mode.

(4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:

Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-190. MMC/SD/SDIO 1 Interface Timing Requirements—SD Identification and Standard SD Mode⁽¹⁾⁽²⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SD Identification Mode							
SD3	$t_{su(CMDV-CLKH)}$	Setup time, sdmmc1_cmd valid before sdmmc1_clk rising clock edge	1198.2		1198.2		ns
SD4	$t_{h(ckH-CMDIV)}$	Hold time, sdmmc1_cmd valid after sdmmc1_clk rising clock edge	1249.0		1249.0		ns
MMC/SD/SDIO 1 Interface (1.8-V IO) Standard SD Mode							
SD3	$t_{su(CMDV-CLKH)}$	Setup time, sdmmc1_cmd valid before sdmmc1_clk rising clock edge	3.1		3.1		ns
SD4	$t_{h(ckH-CMDIV)}$	Hold time, sdmmc1_cmd valid after sdmmc1_clk rising clock edge	17.9		17.9		ns
SD7	$t_{su(datV-CLKH)}$	Setup time, sdmmc1_dat[n:0] valid before sdmmc1_clk rising clock edge	3.1		3.1		ns
SD8	$t_{h(ckH-datV)}$	Hold time, sdmmc1_dat[n:0] valid after sdmmc1_clk rising clock edge	17.9		17.9		ns
MMC/SD/SDIO 1 Interface (3.3-V IO) Standard SD Mode							
SD3	$t_{su(CMDV-CLKH)}$	Setup time, sdmmc1_cmd valid before sdmmc1_clk rising clock edge	3.1		3.1		ns
SD4	$t_{h(ckH-CMDIV)}$	Hold time, sdmmc1_cmd valid after sdmmc1_clk rising clock edge	17.9		17.9		ns
SD7	$t_{su(datV-CLKH)}$	Setup time, sdmmc1_dat[n:0] valid before sdmmc1_clk rising clock edge	3.1		3.1		ns
SD8	$t_{h(ckH-datV)}$	Hold time, sdmmc1_dat[n:0] valid after sdmmc1_clk rising clock edge	17.9		17.9		ns

(1) In sdmmc1_dat[n:0], n up to 7

(2) See DM Operating Condition Addendum for CORE OPP voltages.

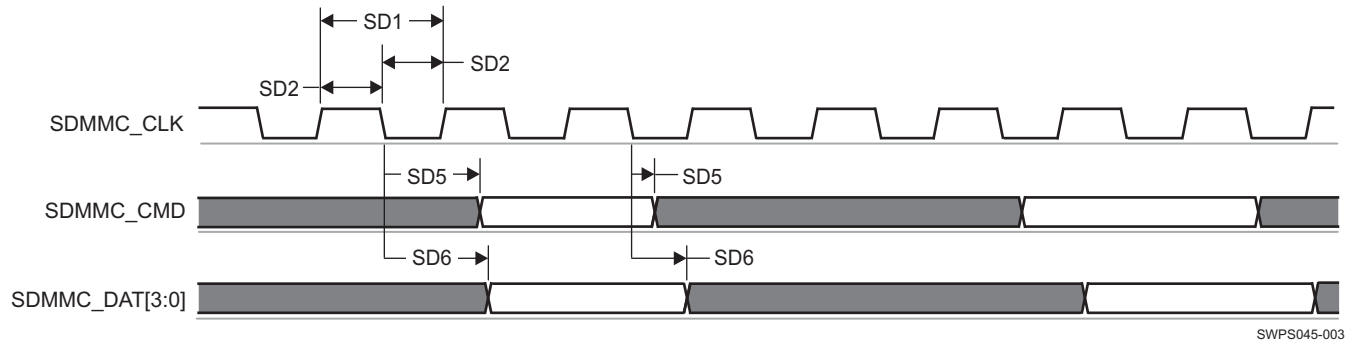

Table 5-191. MMC/SD/SDIO 1 Interface Switching Characteristics—SD Identification and Standard SD Mode⁽¹⁾⁽³⁾⁽⁴⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SD Identification Mode

5.7.1.2 MMC/SD/SDIO 2 Interface

5.7.1.2.1 MMC/SD/SDIO 2 Interface—eMMC—High-Speed SDR JC64 Mode

Table 5-202 and Table 5-203 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-124 and Figure 5-125).

Table 5-201. MMC/SD/SDIO 2 Interface Timing Conditions—High-Speed SDR JC64 Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾⁽⁵⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
For balls: AE5 / AF5 / AE4 / AF4 / AG3 / AF3 / AD2 / AD3 / AD4 / AC2 (Mux Mode 5)				
Input Conditions				
t _R	Input signal rise time	0.15	0.98	ns
t _F	Input signal fall time	0.15	0.98	ns
For balls: C12 / D12 / C13 / D13 / C15 / D15 / A16 / B16 / B11 / B12 (Mux Mode 1)				
Input Conditions				
t _R	Input signal rise time	0.11	1.01	ns
t _F	Input signal fall time	0.12	1.01	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		5	pF
	Trace length		5	cm
	Characteristic impedance	30	55	Ω

- (1) IO settings (Balls: AE5 / AF5 / AE4 / AF4 / AG3 / AF3 / AD2 / AD3 / AD4 / AC2 (Mux Mode 5)): LB0 = 1 and MB[1:0] = 11. For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / 50Ω Output Buffer I/Os with Combined Mode and Load Settings section of the OMAP4470 TRM.
- (2) IO settings (Balls: C12 / D12 / C13 / D13 / C15 / D15 / A16 / B16 / B11 / B12 (Mux Mode 1)): LB0 = 0. For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment section of the OMAP4470 TRM.
- (3) In this table the rise and fall times are calculated for the V_{IL} / V_{IH} described in Section 3.3.11, MMC/SDIO DC Electrical Characteristics.
- (4) For more information on SDMMC ESD guideline examples, see Section A.3.2.2.1, ESD Implementation—MMC/SD/SDIO 1 Interface—SD Mode.
- (5) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-202. MMC/SD/SDIO 2 Interface Timing Requirements—High-Speed SDR JC64 Mode⁽¹⁾⁽²⁾

NO.	PARAMETER	OPP100, OPP119		OPP50		UNIT
		MIN	MAX	MIN	MAX	
For balls: AE5 / AF5 / AE4 / AF4 / AG3 / AF3 / AD2 / AD3 / AD4 / AC2 (Mux Mode 5)						
MMC3	$t_{su}(cmdV-clkH)$	Setup time, sdmmc2_cmd valid before sdmmc2_clk rising clock edge	6		6	ns
MMC4	$t_h(clkH-cmdV)$	Hold time, sdmmc2_cmd valid after sdmmc2_clk rising clock edge	1.6		1.6	ns
MMC7	$t_{su}(dV-clkH)$	Setup time, sdmmc2_dat[n:0] valid before sdmmc2_clk rising clock edge	6		6	ns
MMC8	$t_h(clkH-dV)$	Hold time, sdmmc2_dat[n:0] valid after sdmmc2_clk rising clock edge	1.6		1.6	ns

5.8 Test Interfaces

5.8.1 Digital Processing Manager Interface (DPM)

5.8.1.1 Trace Port Interface Unit (TPIU)

5.8.1.1.1 TPIU PLL DDR Mode – 160 MHz

Table 5-214 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-132).

Table 5-213. TPIU Timing Conditions—PLL DDR Transmit Mode⁽¹⁾⁽²⁾⁽³⁾⁽⁸⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions⁽⁶⁾⁽⁷⁾				
	Number of external peripherals		1	
	Far end load		10 ⁽⁴⁾	pF
	Trace length		10 ⁽⁵⁾	cm
	Characteristic impedance	40	60	Ω

(1) IO settings (balls: M2 / N2 / P2 / V1 / V2 / W1 / W2 / W3 / W4 / Y2 / Y3 / Y4 / AA1 / AA2 / AA3 / AA4 / AB2 / AB3 / AB4 / AC4): DS0 = 1.

For more information, see Control Module / Control Module Functional Description/ Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) For more information regarding the subsystem multiplexing, see Section 2.4.5.3, TPIU.

(3) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(4) Either use a far end load less than 10 pF or, add an external buffer in case of higher loads.

(5) Either use a maximum trace length equals to 10 cm or, a 5-cm cable and a 5-cm PCB.

- (6) A series resistor of 15 Ω is recommended to be added to limit the overshoot and the undershoot on far end signals.
- (7) It is also recommended to minimize the number of vias by layer transitions.
- (8) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-214. TPIU Switching Characteristics—PLL DDR Transmit Mode⁽⁵⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

	$t_{R(\text{clk})}$	Rise time, output clock atpiu_clk		2.62		2.62	ns
	$t_{F(\text{clk})}$	Fall time, output clock atpiu_clk		2		2	ns
TPIU4	$t_{d(\text{clk-ctlV})}$	Delay time, output clock atpiu_clk low/high to output control atpiu_cntl transition		0.884		0.884	ns
TPIU5	$t_{d(\text{clk-dataV})}$	Delay time, output clock atpiu_clk low/high to output data atpiu_d[n:0] ⁽⁴⁾ transition		0.884		0.884	ns
	$t_{R(\text{DO})}$	Rise time, output data atpiu_d[n:0] ⁽⁴⁾ and output control atpiu_cntl		2.62		2.62	ns
	$t_{F(\text{DO})}$	Fall time, output data atpiu_d[n:0] ⁽⁴⁾ and output control atpiu_cntl		2		2	ns

- (1) Related to the atpiu_clk maximum frequency.
- (2) P = atpiu_clk period in ns
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) In atpiu_d[n:0], n is equal to 15 or 17.
- (5) See DM Operating Condition Addendum for CORE OPP voltages.

**Figure 5-132. TPIU—PLL DDR Transmit Mode⁽¹⁾**

- (1) In d[X:0], X is equal to 15 or 17.

5.8.1.2 System Trace Module Interface (STM)

The System Trace Module interface (STM) module provides real-time software tracing functionality to the OMAP4470 device.

The trace interface has four trace data pins and a trace clock pin.

This interface is a dual edge interface:

- The data are available on rising and falling edge of STM clock.
- But can be also configured in single-edge mode where data are available on the falling edge of STM clock.

Serial interface operates in clock stop regime: serial clock is not free-running; when there is no trace data, there is no trace clock.

5.8.1.2.1 STM – Lauterbach DDR Transmit Mode

Table 5-216 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-133).

Table 5-215. STM Timing Conditions—Lauterbach DDR Transmit Mode⁽¹⁾⁽³⁾⁽⁸⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions⁽⁶⁾⁽⁷⁾				
	Number of external peripherals		1

(1) Related to astm_clk maximum frequency.

(2) P = astm_clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) See DM Operating Condition Addendum for CORE OPP voltages.

Figure 5-134. STM—MIPI DDR Transmit Mode

5.8.1.2.2.2 STM—MIPI Transmit—SDR Mode

Table 5-220 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-135).

Table 5-219. STM Timing Conditions—MIPI SDR Transmit Mode⁽¹⁾⁽³⁾⁽⁸⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
PCB Conditions⁽⁶⁾⁽⁷⁾				
	Number of external peripherals		1	
	Far end load		10 ⁽⁴⁾	pF
	Trace length		10 ⁽⁵⁾	cm
	Characteristic impedance	45	60	Ω

(1) IO settings (Balls in Option 1: M2 / N2 / P2 / V1 / V2⁽²⁾)

Balls in Option 2: AA4 / AB2 / AB3 / AB4 / AC4⁽²⁾

Balls in Option 3: M2 / N2⁽²⁾: DS0 = 1.

For more information, see Control Module / Control Module Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment / I/O cells with Configurable Output Driver Impedance section of the OMAP4470 TRM.

(2) For more information regarding the subsystem multiplexing, see Section 2.4.5.4, STM.

(3) In this table the rise and fall times are calculated for 20% to 80% of VDD5. For more information on the corresponding OMAP4 VDD5 power supply name, see Table 2-1, POWER [9] column with the ball name.

(4) Either use a far end load less than 10 pF or, add an external buffer in case of higher loads.

(5) Either use a maximum trace length equal to 10 cm or, a 5-cm cable and a 5-cm PCB.

(6) A series resistor of 15 Ω is recommended to be added to limit the overshoot and the undershoot on far end signals.

(7) It is also recommended to minimize the number of vias by layer transitions.

(8) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-220. STM Switching Characteristics—MIPI SDR Transmit Mode⁽⁴⁾

NO.	PARAMETER		OPP100, OPP119		OPP50		UNIT
			MIN	MAX	MIN	MAX

- (2) P = astm_clk period in ns
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) See DM Operating Condition Addendum for CORE OPP voltages.

Figure 5-135. STM—MIPI SDR Transmit Mode

5.8.2 JTAG Interface (JTAG)

The JTAG TAP controller handles standard IEEE JTAG interfaces. The following section defines the Timing requirements for several tools used to test the OMAP4470 as:

- Free-running clock tool, like XDS560 and XDS510 tools
- Adaptive clock tool, like RealView® ICE tool and Lauterbach™ tool

5.8.2.1 JTAG—Free-Running Clock Mode

Table 5-222 and Table 5-223 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-136).

Table 5-221. JTAG Timing Conditions—Free-running Clock Mode⁽¹⁾⁽³⁾⁽⁴⁾

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t _R	Input signal rise time		5	ns
t _F	Input signal fall time		5	ns
PCB Conditions				
	Number of external peripherals		1	
	Far end load		30	pF
	Trace length		See ⁽²⁾	cm
	Characteristic impedance	40	60	Ω

- (1) Corresponding balls: AH2 / AG1 / AE3 / AH1 / AE1 / AE2
- (2) Maximum PCB trace length = 5 cm and maximum cable = 15 cm
- (3) For more information on JTAG ESD guideline example, see Section A.3.2.2.3, ESD Implementation—JTAG and cJTAG Interfaces.
- (4) To have an idea of the output OMAP4 ball load supported for this application, you can consider the following:
Output OMAP4 ball load = Far End load + 1.34 pF/cm (typical) x trace length (cm).

Table 5-222. JTAG Timing Requirements—Free-running Clock Mode⁽⁴⁾⁽⁵⁾

SWPS040-099

Figure 5-137. JTAG Interface Timing—Adaptive Clock Mode

5.8.3 cJTAG Interface (cJTAG)

The cJTAG module is a component which can run a 2-pin communication protocol on top of an IEEE 1149.1 JTAG Test Access Port (TAP). The cJTAG logic serializes the IEEE 1149.1 transactions, using a variety of compression formats, to reduce the number of pins needed to implement a JTAG debug and boundary scan port. The OMAP4470 platform implements only a basic 3-pin scan configuration.

Table 5-228 and Table 5-229 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-138).

Table 5-227. cJTAG Timing Conditions—Normal Mode⁽¹⁾⁽³⁾⁽⁴⁾

**Figure 5-138. cJTAG Interface Timing—Normal Mode**

SWPS040-100

6 Thermal Management

For reliability and operability concerns, the absolute maximum junction temperature of OMAP4470 has to be below 125°C and the maximum average junction temperature has to be below 110°C.

Depending on the thermal mechanical design (Smartphone, Tablet, Personal Navigation Device, etc), the system thermal management software and worst case thermal applications, the junction temperature might be exposed to higher values than those specified above.

Therefore, it is recommended to perform thermal simulations at device level (Smartphone, Tablet, Personal Navigation Device, etc) with the measured power of the worst case UC of the device.

Based on the results, if the temperature limits are exceeded, an OMAP level software thermal policy can be set up; for detailed information, see SWPA188B, *OMAP4470 Thermal Management* application note. The OMAP level thermal policy relies on a PCB sensor. Therefore, it is recommended to have such sensors located on the PCB; for more information, see [Section 6.2.1, PCB Sensor Recommendation](#). In addition, it is recommended to avoid having another significant thermal source near the OMAP4470.

The risks of not managing this junction temperature are hazardous heating, power supply clamping, reliability issues, and malfunction.

6.1 Package Thermal Characteristics

[Table 6-1](#) provides the thermal resistance characteristics for the package used on this device.

Table 6-1. Thermal Resistance Characteristics

PACKAGE	POWER (W) ⁽⁴⁾	θ_{JA} (°C/W) ⁽²⁾	Ψ_{JB} (°C/W) ⁽³⁾⁽⁴⁾	BOARD TYPE
OMAP4470	2.6	22.6	9.5	2S2P ⁽¹⁾

(1) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Array Surface Mount Package Thermal Measurements). The board temperature is measured at 1 mm from the package edge.

(2) θ_{JA} (Theta-JA) = Thermal Resistance Junction-to-Ambient, °C/W.

(3) Ψ_{JB} (Psi-JB) = Thermal Resistance Psi Junction-to-Board, °C/W derived from thermal simulation following JEDEC reference (JEDEC standard JESD51-9, *Test Board for Array Surface Mount Package Thermal Measurements*).

(4) $T_J = P * \Psi_{JB} + T_B$
With P is the dissipated power, $T_B = 85^\circ\text{C}$, $T_J = 110^\circ\text{C}$, dissipated power $P = 2.6\text{ W}$.

CAUTION

Ψ_{JB} (Psi-JB) value is dependent on the board (PCB) and the power distribution related to the power use case: 9.5°C/W is given for a 2.6-W dissipated power in a JEDEC PCB. Based in Ψ_{JB} JEDEC simulation, depending on the device power distribution, the Ψ_{JB} (Psi-JB) could vary between 9°C/W and 16°C/W.

6.2 Temperature Sensor Recommendation

6.2.1 PCB Temperature Sensor

To manage the OMAP4470 junction temperature, an external PCB temperature sensor is required in addition to the internal OMAP4470 thermal sensor.

The accuracy of the temperature sensor is critical to optimize the OMAP performance; the minimum recommended accuracy is $\pm 2^{\circ}\text{C}$; see the TI TMP102 temperature sensor component. The temperature sensor can be located at three different positions to correctly monitor the OMAP4470 junction temperature:

- pos 1: 1 mm of the package
- pos 2: 1 mm of the package
- pos 3: On the bottom layer of the PCB, underneath OMAP4470 (top layer) in the center of the package

Figure 6-1. PCB Temperature Sensor Recommendation (Top View Package)

6.2.2 Junction Temperature Sensor

The OMAP4470 device supplies a temperature sensor feature which is in the band gap voltage and temperature sensor (VBGAPTS) module. An analog-to-digital converter (ADC) converts the silicon temperature into an 10-bit output decimal value.

NOTE

For more information, see Control Module / Control Module Functional Description / Band Gap Voltage and Temperature Sensor / Temperature Sensor section of the OMAP4470 TRM.

[Table 6-2](#) gives the temperature sensor characteristics.

Table 6-2. Temperature Sensor Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
ADC resolution (DTEMP[9:0])		10		Bit
ADC temperature step	0.4	0.5	0.6	°C
ADC temperature accuracy for temperature range –40°C to 125°C			±2 ⁽¹⁾	°C
ADC conversion time			50	µs

(1) The maximum accuracy ±2°C means the worst case of the ADC accuracy.

7 Package Characteristics

7.1 Device Nomenclature

7.1.1 Standard Package Symbolization

SWPS045-001

Figure 7-1. Printed Device Reference

NOTE

- Black: Static field
 - Blue: Variable field coded with letters and/or numbers
 - Green: Variable fields coded with numbers
- The letters and numbers fields are interleaved to facilitate the parameters reading.

7.1.2 Device Naming Convention

Table 7-1. Nomenclature Description

FIELD	DEFINITION	VALUE	DESCRIPTION
a	Device evolution stage ⁽¹⁾	X / Blank	Qualification Status: X – Prototype, Unqualified Production Blank – Production
ABCD	Device Name	4470	OMAP4470
r	Device revision	Blank / A / ...	Blank for 1.0, A, B... for next revisions ES1.0 for 4470
PPP	Package designator	CBL / CBS	CBL – POP/HIJI (prototype only) CBS – TMV/(Amkor/TIPI) (prototype / production)
YM	Lot Trace Code (LTC): Y = Year, M = Month		
LLLL	Lot Trace Code (LTC): Assembly lot number		
S	Reserved		
\$	Reserved		
O	Pin one designator		
G1	ECAT –Green package designator		
Yy	Device type	BLANK	General purpose (Prototype and Production)
		XX	Reserved
Z	Device Speed	BLANK	OMAP4470-1300 (1300 MHz)
		5	OMAP4470-1500 (1500 MHz)

(1) To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of OMAP4 processors. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices. Device development indicator:

- X: Experimental, preproduction, sample or prototype device. Device may not meet all product qualification conditions and may not fully comply with TI Specifications.
- BLANK: Device is qualified and released to production. TI's standard warranty applies to production devices.

Experimental / Prototype devices are shipped against the following disclaimer: "This product is still in development and is intended for internal evaluation purposes." Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, of this device

NOTE

BLANK in the symbol or part number is collapsed so there are no gaps between characters.

7.1.3 SAP Part Number

The actual part number used in the system follows this syntax (SAP allows a maximum of 14 characters):

- SAP part number in Tray: a**ABCD**rZFYyPPP
- SAP part number in Tape and Reel: a**ABCD**rZFYyPPPR

7.2 Mechanical Data

Figure 7-2 shows the mechanical package.

CBS (S-PBGA-N547) TMV PACKAGE PLASTIC BALL GRID ARRAY

A OMAP4470 Processor Multimedia Device PCB Guideline

A.1 Introduction

NOTE

OMAP™ 4 processors are intended for manufacturers of Smartphones and other mobile devices.

NOTE

Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, for customer boards. The data described in this appendix are intended as guidelines only.

This appendix complements the OMAP4470 data manual. It provides:

- Guidelines for the design of the PCB focusing first on power delivery network (PDN) implementation that is essential to achieve desired level of performance on OMAP4470.
- General principles and step-by-step approach for good PDN implementation and specific requirements for the different power supplies of OMAP4.
- Methodology and requirements to meet the PCB routing of OMAP4470 differential interfaces (MIPI CSI and DSI, USB, and HDMI) and TV-OUT interface.
- PCB requirements for the general-purpose interfaces using the CMOS driver to meet timing requirements and minimize overshoot / undershoot at the far-end peripheral.

A.2 Initial Requirements and Guidelines

A.2.1 Introduction to the PCB Guidelines

The recommendation for board stackup is an 8-layer design in either 2+x+2 or 3+x+3 where x represents the number of core layers with 2 or 3 build-up layers depending upon number of signals routed on PCB.

Table A-1. PCB Stackup—8 Layers

PCB STACK-UP 2+4+2		THICKNESS (μm)	PCB STACK-UP 3+2+3		THICKNESS (μm)
Layer 1 (top)	Signal	20	Layer 1 (top)	Signal	20
Dielectric		70	Dielectric		70
Layer 2	GND plane	20	Layer 2	GND plane	20
Dielectric		70	Dielectric		70
Layer 3	Signal	30	Layer 3	Signal	20
Dielectric		100	Dielectric		70
Layer 4	Signal	30	Layer 4	Signal	30
Dielectric		100	Dielectric		200
Layer 5	PWR plane	30	Layer 5	PWR plane	30
Dielectric		100	Dielectric		70
Layer 6	Signal / GND	30	Layer 6	Signal / GND	20
Dielectric		70	Dielectric		70
Layer 7	Signal	20	Layer 7	Signal	20
Dielectric		70	Dielectric		70
Layer 8	Signal / GND	20	Layer 8	Signal / GND	20
Total (μm)		780	Total (μm)		800

The 10-layer implementation can be considered as well in case of requirements for small PCB form factors.

Table A-2. PCB Stackup—10 Layers

PCB STACK-UP 3+4+3		THICKNESS (μm)
Layer 1 (top)	Signal	20
Dielectric		70
Layer 2	GND plane	20
Dielectric		70
Layer 3	Signal	20
Dielectric		70
Layer 4	Signal	30
Dielectric		100

Layer 9	Plane	20
Dielectric		70
Layer 8 (Bottom)	Signal	20
Total (μm)		960

- The PDN must be optimized for low trace resistance and low trace inductance between the power management IC (PMIC) and OMAP4 especially for vdd_mpu, vdd_iva_audio, and vdd_core power supplies (ranked by order of criticality per their respective peak currents).
- Optimize routing power routing between vdd_mpu and the PMIC.
- OMAP4430-1000, OMAP4430-800, and OMAP4470 devices have different peak currents for vdd_mpu. Hence, specific PDN must be designed for vdd_mpu. For more information on OMAP4430 PCB guideline, see the OMAP4430 ES2.x data manual, Appendix A, *OMAP4430 Processor Multimedia Device PCB Guideline*.
- It is highly recommended to run board frequency domain analysis on vdd_mpu, vdd_iva_audio, and vdd_core power supplies to check if proper board decoupling is implemented and confirm that respective target impedances are met. For more information on target impedance, see [Section 3.4, External Capacitors](#).
- Characteristic impedance for single-ended interfaces is recommended to be between 30 Ω and 60 Ω and in some specific cases between 40 Ω and 55 Ω to minimize overshoot and undershoot on far-end loads.
For more information see [Section A.3, Single-Ended Interfaces](#).
- Characteristic impedance for single-ended interfaces must meet 50-Ω (±10%) and 100-Ω differential impedance.
For more information see [Section A.4, Differential Interface PCB Guidelines](#).
- External interface using connector must be protected following the IEC61000-4-2 level 4 system ESD (±8 kV in contact mode or ±15 kV air discharge mode).
See also the respective sections of USB A0 PHY ([Section A.4.4.3, ESD Implementation—USBA0 PHY](#)), HDMI ([Section A.4.5, HDMI Interface in OMAP4](#)), SDMMC1 ([Section A.3.2.2.1, ESD Implementation—MMC/SD/SDIO 1 Interface—SD Mode](#)), Keypad ([Section A.3.2.2.2, ESD](#)

Implementation—KeyPAD Interface) and JTAG or cJTAG (Section A.3.2.2.3, ESD Implementation—JTAG and cJTAG Interfaces) interfaces for specific ESD requirements and implementation proposals.

- LPDDR2 memory:
 - OMAP4 supports two LPDDR2 channels. Each of these channels supports up to two chip selects. Up to four LPDDR2 memory dies can be connected on top of OMAP4 package via Package-on-Package implementation. Powers for LPDDR2 memory are connected via feedthrough in OMAP4470 package.
 - The memory component LPDDR2-S4A and LPDDR2-S4B memory have different voltage requirements. The S4B type needs a single 1.2-V source to supply vdd2 and vddq / vddca.

A.2.2 PCB Power General Routing Guidelines

In this section you will find the necessary steps for the PCB power general routing:

- [Section A.2.2.1, Step 1](#): Requirements and guidelines for PCB stack-up
- [Section A.2.2.2, Step 2](#): Physical layout guidelines of the PDN
- [Section A.2.2.3, Step 3](#): Static IR drop guidelines of PDN. Minimize resistance, avoid neck-down, and reduce current density.

A.2.2.1 Step 1: PCB Stack-up Guidelines

The PCB stack-up (layer assignment) is an important factor in determining the optimal performance of the power distribution system. An optimized PCB stack-up for higher power integrity performance can be achieved by following these requirements:

- Power and ground plane pairs must be closely coupled together. The capacitance formed between the planes can decouple the power supply at high frequencies. Whenever possible, the power and the ground planes must be solid to provide continuous return path for return current.
- Use a thin dielectric thickness between the power and ground plane pair. Capacitance is inversely proportional to the separation of the plane pair. Minimizing the separation distance (the dielectric thickness) will maximize the capacitance.
- Keep the power and ground plane pair as close as possible to the top and bottom surfaces (see [Figure A-1](#)). This will help in minimizing the decoupling capacitors mounting, via, and the power / ground plane pair spreading loop inductance.

Figure A-1. Minimize Loop Inductance With Proper Layer Assignment

The placement of power and ground planes in the PCB stackup (determined by layer assignment) has a significant impact on the parasitic inductances of power current path as shown in [Figure A-1](#). For this reason, it is recommended to consider layer order in the early stages of the PCB PDN design cycle, putting high priority supplies in the top half of the stackup and low-priority supplies in the bottom half of the stackup as shown in the examples below (vias have parasitic inductances which impact the bottom layers more, so it is advised to put the sensitive and high priority power supplies on the top layers).

[Figure A-2](#) and [Figure A-3](#) show examples of typical PCB stack-up designed with power integrity in mind.

Figure A-2. Layer PCB With High Density Interconnect (HDI) Vias⁽¹⁾

- (1) Recommendation:
- GND on layer 2
 - The signal escape on layer 3 and layer 4, PWR on layer 5

Figure A-3. Layer PCB With Plated Through Holes (PTH) Vias⁽¹⁾

- (1) 2-4-2 PCB only possible if the interfaces number is reduced.

Recommendation:

- GND on layer 2
- Signal escape on layer 3 and layer 4, PWR on layer 5

A.2.2.2 Step 2: Physical Layout Guidelines of the PDN

A critical step in designing an optimized PDN is that proper care must be taken to ensure that the initial layout is planned with good power integrity design guidelines in mind. The following points are important requirements that will be needed to be implemented in the PCB PDN design:

- External trace routing between components must be as wide as possible. The wider the traces the lower the dc resistance and consequently the lower the static IR drop.
- Whenever possible, try aiming for a ratio of 1:1 or better for component (for example, capacitors and resistors) pins and vias. Do not share vias among multiple capacitors.
- Placement of the vias must be as close as possible to the solder pad.

Figure A-4 shows an example of acceptable width for power net routing but with poor via placement.

SWPS040-211

Figure A-4. Poor Via Assignment for PDN

Figure A-5 shows an improved power net routing with appropriate via assignment and placement.

SWPS040-212

Figure A-5. Improved Via Assignment for PDN

- To avoid the maximum current carrying capacity of each transitional via, an evaluation must be performed to determine the appropriate number of vias required to connect components. [Figure A-6](#) and [Figure A-7](#) show examples of via starvation on a power net transitioning from top routing layer to internal layers and the improved layout, respectively.

SWPS040-213

One via for 5 capacitor pads is NOT good practice

Figure A-6. Via Starvation

Figure A-7. Improved Layout With More Transitional Vias

- It is also a good practice to perform static IR drop. This analysis can assess the appropriate number of vias and geometrical trace width dimensions required for the expected IR drop requirement.
- Whenever possible for the internal layers (routing and plane), wide traces and copper area fills are preferred for the PDN layout. The routing power nets in plane provide for more interplane capacitance and improve high frequency performance of the PDN.
- Try to avoid different power nets (for example, VDD_MPU with VDD_CORE) coupling on the PCB by using coplanar shielding whenever appropriate.

Figure A-8 represents an example of coplanar shielding for power nets.

Figure A-8. Coplanar Shielding of Power Net Using Ground Guard-band

- Decoupling capacitors must be mounted with minimum impact to inductance. A real capacitor has characteristics not only of capacitance but also inductance and resistance.

Figure A-9 shows the parasitic model of a real capacitor. A real capacitor must be treated as an RLC circuit with effective series resistance (ESR) and effective series inductance (ESL).

Figure A-9. Characteristics of a Real Capacitor With ESL and ESR

The magnitude of the impedance of this series model is given as:

$$|Z| = \sqrt{ESR^2 + \left(\omega ESL - \frac{1}{\omega C}\right)^2}$$

where : $\omega = 2\pi f$

SWPS040-e002

Figure A-10. Series Model Impedance Equation

Figure A-11 shows the resonant frequency response of a typical capacitor with self-resonant frequency of 55 MHz. The impedance of the capacitor is a combination of its series resistance and reactive capacitance and inductance as shown in the equation above.

Figure A-11. Typical Impedance Profile of a Capacitor

Because a capacitor has series inductance and resistance that will impact its effectiveness, it is important that the following recommendations are adopted in placing them on the PDN. Whenever possible, please mount the capacitor with the geometry that will minimize the mounting inductance and resistance. This was shown earlier in Figure A-1. The capacitor mounting inductance and resistance includes the inductance and resistance of the pads, trace, and vias.

The length of a trace to connect a capacitor has a big impact on parasitic inductance and resistance of the mounting. This trace must be as short and wide as possible. Wherever possible, minimize the trace by locating vias near the solder pad landing. Further improvements can be made to the mounting by placing vias to the side of capacitor lands or doubling the number of vias as shown in [Figure A-12](#). If the PCB manufacturing processes allow and if cost-effective, via-in-pad (VIP) geometries are strongly recommended.

In addition to mounting inductance and resistance associated with placing a capacitor on the PCB, the effectiveness of a decoupling capacitor also depends on the spreading inductance and resistance that the capacitor sees with respect to the load. The spreading inductance and resistance is strongly dependent on the layer assignment in the PCB stack-up (as shown in [Figure A-2](#)).

SWPS040-177

Figure A-12. Capacitor Placement Geometry for Improved Mounting Inductance

A.2.2.3 Step 3: Static IR Drop PDN Guidelines

Delivering reliable power to circuits is always of critical importance because IR drops can happen at every level in a chip, package, and board system. Components that are distant from their associated power source are particularly susceptible to IR drop. The designs that rely on battery power must minimize voltage drop to avoid unacceptable power loss. Early dc assessments help determine power distribution basics such as the best available entry point for power, layer stackup choices, and estimates for the amount of copper needed to carry the current.

The resistance R_s of a plane conductor for a unit length and unit width is called the **surface resistivity** (ohms per square).

SWPS040-178

Figure A-13. Depiction of Sheet Resistivity and Resistance

Ohm's Law ($V = I * R$) relates conduction current to voltage drop and at dc the relation coefficient is a constant representing the resistance of the conductor. Conductors also dissipate power due to their resistance. Both voltage drop and power dissipation are proportional to the resistance of the conductor.

System-level IR drop budget is made up of three portions: on-chip, package and PCB board. Static IR or dc analysis / design methodology consists of designing the power distribution network such that the voltage drop (under dc operating conditions) across power and ground pads of the transistors of the application processor device is within a specified value of the nominal voltage for proper functionality of the device.

Figure A-14 shows the PCB-level static IR drop budget is defined between the pins of the power management device PMIC / VRM and the BGA pads on the PCB to the application processor device to which the PMIC is supplying power.

Figure A-14. Static IR Drop Budget for PCB Only

The total system-level margin allowed for proper device functionality is given, allowable voltage variation at the BGA of the device is specified at 1.5% of the nominal voltage. For a 1.35-V supply, this must be ≤ 20 mV. It is highly recommended to connect the VRM or the PMIC as close as physically possible on the PCB to the OMAP4470 device.

To accurately analyze PCB static IR drop, the actual geometry of the PDN must often be properly modeled and simulated to accurately characterize long distribution paths, low weight copper, electro-migration violations of current-carrying vias, and swiss-cheese effects. It is recommended to perform the following analyses:

1. Lumped resistance / IR drop analysis
2. Distributed resistance / IR drop analysis

The requirements are present to perform both analyses and to show compliance. In the following sections each methodology is described in detail and examples provided of analysis flow that can be used by the PCB designer to validate compliance to the requirements on their PCB PDN design.

A.2.3 Lumped and Distributed Resistance/IR Drop Analysis Methodology

Lumped methodology consists of grouping all of the power / ground pins of the PMIC and the processor device; this is followed by extracting the lumped resistance or dc voltage drop of the equivalent path by applying a voltage source at the PMIC end and a current sink at the device end. Figure A-15 describes the pin-grouping concept.

SWPS040-179

Figure A-15. Pin-grouping Concept: Lumped and Distributed Methodologies

The lumped methodology consists of importing the PCB layout database (from Cadence Allegro tool or any other layout design tool) into the static IR drop modeling and simulation tool of preference for the PCB designer. This is followed by applying the correct PCB stack-up information (thickness, material properties) of the PCB dielectric and metallization layers. The material properties of dielectric consist of permittivity (Dk) and loss tangent (Df).

For the conductor layers, the correct conductivity needs to be programmed into the simulation tool. This is followed by pin-grouping of the power and ground nets, and applying appropriate voltage / current sources.

The current and voltage information can be obtained from the power and voltage specifications of the device under different operating conditions / use-modes. After running the simulation, the lumped resistance and lumped IR drop can be examined as shown in [Figure A-15](#).

A.2.4 System ESD Generic Guidelines

NOTE

IEC61000-4-2: The ESD discharges described in this section apply only to HDMI, USB A0 PHY, SD/MMC card cage, composite video, JTAG, cJTAG, and points and surfaces of the Equipment Under Test (EUT) that are accessible to the end-user during normal use.

The following exclusions apply (that is, discharges are not applied to these items):

- In the case of the contacts of coaxial and multipin connectors which are provided with a metallic connector shell, contact discharges are only applied to the metallic shell contacts. Falling into this category:
HDMI/USB connectors, SD/MMC card cage, audio headset jack connector
- Those points and surfaces that are only accessible under service by the end-user. Examples of these rarely accessed points are battery contacts while changing batteries. Falling into this category:
Battery connector
- Those points and surfaces that are only accessible under maintenance. In this case, special ESD mitigation procedures are given in the accompanying documentation. Falling into this category:
JTAG test points
- Those points and surfaces of equipment that are no longer accessible after fixed installation or after following the instructions for use; for example, the bottom and/or wall side of equipment or areas behind fitted connectors. Potentially falling into this category:
Audio speaker spring contacts

A.2.4.1 IEC61000-4-2 Standard Overview—System ESD

System ESD differs from the usual component level ESD tests such as HBM (ANSI/ESDA/JEDEC JS-001-2010) or CDM (JESD22 C101) described in [Table 3-1, Absolute Maximum Rating Over Junction Temperature Range](#). HBM and CDM are tests to evaluate product robustness to ESD events in the manufacturing environment. System ESD is designed to evaluate events that occur when the end-users interact with the final product as they use it. IEC 61000-4-2 is one of the major system level standards used to qualify products for human contact. Sometimes these events are referred to as EMC immunity events.

The standard defines immunity requirements for ESD that can be coupled into the equipment directly (contact discharge) or indirectly through radiation. The charging model is defined with a discharging 150-pF capacitor through a 330-Ω resistor. Direct coupling includes any user accessible entry points such as external connectors, keypad, panel displays, equipment housings, etc.

The ESD stress level is divided into four levels. Level 1 is considered the least severe while Level 4 is the most severe. IEC 61000-4-2 also specifies the ESD current waveform and parameters shown in [Figure A-16](#) and [Table A-3](#). The rise time is extremely fast, defined as 0.7 to 1 ns to reach the first peak, with a second peak at 30 ns and a total duration of only 60 ns.

Figure A-16. IEC61000-4-2 Waveform

Table A-3. Waveform Parameters

LEVEL	INDICATED VOLTAGE (kV)	FIRST PEAK CURRENT of DISCHARGE $\pm 10\%$ (A)	RISE TIME, t_r , WITH DISCHARGE SWITCH (ns)	CURRENT ($\pm 30\%$) at 30 ns	CURRENT ($\pm 30\%$) at 60 ns
1	2	7.5	0.7 to 1	4	2
2	4	15	0.7 to 1	8	4
3	6	22.5	0.7 to 1	12	6
4	8	30	0.7 to 1	16	8

Test results are classified in terms of the loss of function or degradation of performance for the system under test. The recommended classification is as follows:

1. Normal performance within limits specified by the manufacturer
2. Temporary loss of function or degradation of performance which ceases after the disturbance ceases,

and the system recovers its normal performance without operator intervention

3. Temporary loss of function or degradation of performance, the correction of which requires operator intervention
4. Loss of function or degradation of performance which is not recoverable, due to damage to hardware or software, or loss of data

A.2.4.2 Objective and Limitation of the Protection Strategy

CAUTION

System level (IEC61000-4-2) ESD results are dependent on the product (Boards and Mechanics) implementation and the components being used. Thus, the protection strategy defined in this document, does not assure to meet IEC61000-4-2 compliance requirement on any final product. Document suggestions must be considered as guidance to help protecting OMAP4470 exposed interfaces against physical damage. Soft failures cannot be simulated and are not accounted for in these recommendations.

The protection strategy is intended to protect against ± 8 kV direct contact discharge. The protection strategy is based upon simulations replicating a general board design with an IEC ESD pulse exhibiting the current waveform as defined in [Figure A-16](#), *IEC61000-4-2 Waveform*, and [Table A-3](#), *Waveform Parameters*. External protections, additional isolation resistors, and other passives have been selected or dimensioned accordingly.

Part numbers that are different than the provided reference schematic are not assured to meet system level ESD requirements.

A.2.4.3 Concept of Isolation Impedance

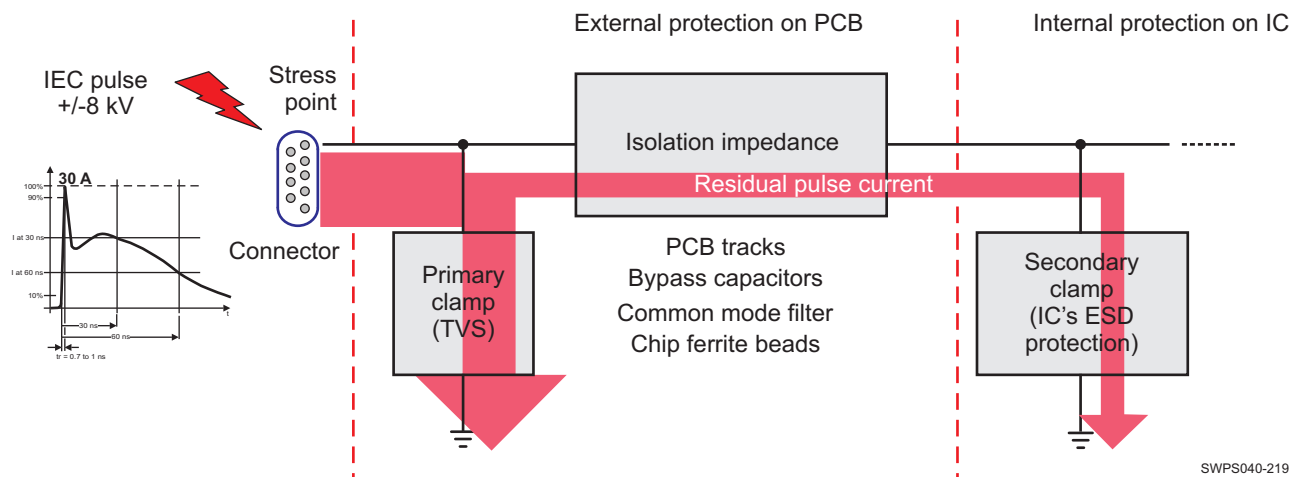

Figure A-17. Simplified Current Distribution

Under an ESD event the external and internal ESD protection turns on and current is distributed between internal and external ESD protection; the distribution ratio being defined, at first order, by the ratio between the dynamic resistances R_{DYN} of the two protections. To further minimize the current flowing into the internal protection IC, whenever possible (signal integrity constraints), isolation impedance can be increased by taking advantage of the PCB implementation:

- PCB routing track length
- Decoupling capacitor on power supply
- Common mode filter on differential lines

- Chip ferrite bead
- Isolation resistors

A.2.4.4 System ESD Generic PCB Guideline

External interface using a connector must be protected by following the IEC61000-4-2 level 4 system ESD (± 8 kV in contact mode or ± 15 kV air discharge mode).

Protection devices must be placed close to the ESD source which means close to the connector. This allows the device to subtract the energy associated with ESD strike before it reaches the internal circuitry of the application board.

To help minimize the residual voltage pulse that will be built-up at the protection device, due to its nonzero turn-on impedance, it is mandatory to route the ESD device with minimum stub length so that the low-resistive, low-inductive path from the signal to the ground is granted and not increasing the impedance between signal and ground.

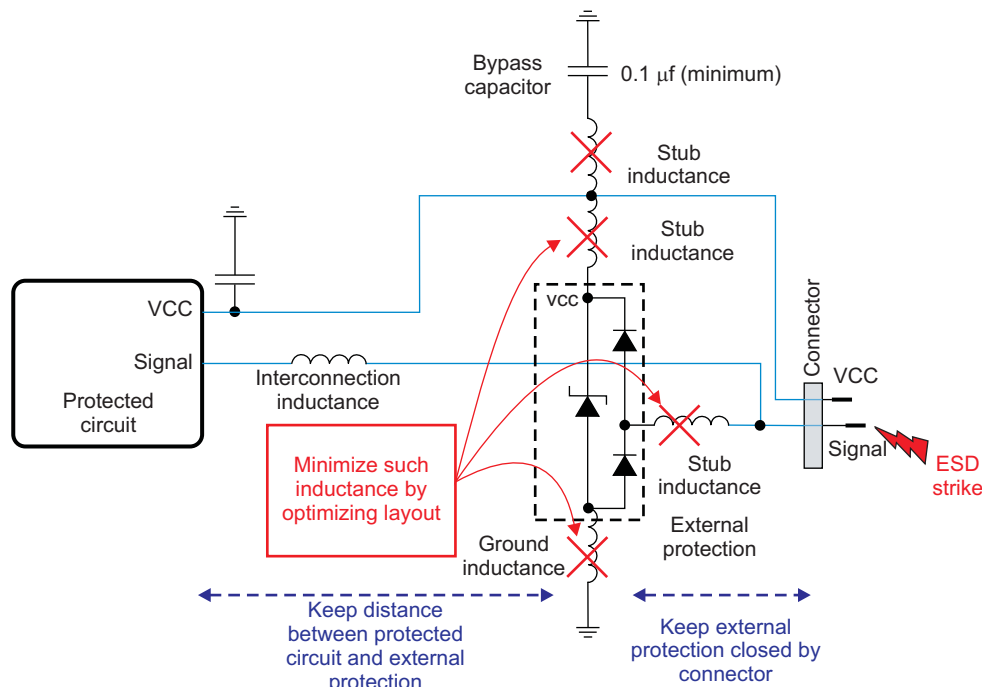

For ESD protection array being railed to a power supply when no decoupling capacitor is available in close vicinity, consider using a decoupling capacitor ($\geq 0.1 \mu\text{F}$) tight to the VCC pin of the ESD protection. A positive strike will be partially diverted to this capacitance resulting in a lower residual voltage pulse.

Ensure that there is enough metallization for the supply of signals at the interconnect side (VCC and GND in [Figure A-18](#)) from connector to external protection because the interconnect may see between 15-A to 30-A current in a short period of time during the ESD event.

NOTE

System level ESD results (IEC61000-4-2 level 4) are dependent on the components being connected to the product.

Part numbers that are different than the reference board specification are not assured to meet system level ESD requirements.

SWPS040-180

Figure A-18. Placement Recommendation for an ESD External Protection

A.2.4.5 Miscellaneous EMC Guidelines to Mitigate ESD Immunity

The miscellaneous EMC guidelines are:

- Avoid running critical signal traces (clocks, resets, interrupts, control signals, etc.) near PCB edges.
- Add high frequency filtering: Decoupling capacitors close to the receivers rather than close to the drivers to minimize ESD coupling.
- Put a ground (guard) ring around the entire periphery of the PCB to act as a lightning rod.
- Connect the guard ring to the PCB ground plane to provide low impedance path for ESD-coupled current on the ring.
- Fill unused portions of the PCB with ground plane.
- Minimize circuit loops between power and ground by using multilayer PCB with dedicated power and ground planes.
- Shield long line length (strip lines) to minimize radiated ESD.
- Avoid running traces over split ground planes. It is better to use a bridge connecting the two planes in one area.

SWPS040-220

Figure A-19. Trace Examples

- Always route signal traces and their associated ground returns as close to one another as possible to minimize the loop area enclosed by current flow:
 - At high frequencies current follows the path of least inductance.
 - At low frequencies current flows through the path of least resistance.

A.3 Single-Ended Interfaces

A.3.1 General Routing Guidelines

The following paragraphs detail the routing guidelines that must be observed when routing the various functional LVCMOS interfaces.

- Line spacing:
 - For a line width equal to W , the spacing between two lines must be $2W$, at least. This minimizes the crosstalk between switching signals between the different lines. On the PCB, this is not achievable everywhere (for example, when breaking signals out from the OMAP4470 package), but it is recommended to follow this rule as much as possible. When violating this guideline, minimize the length of the traces running parallel to each other (See [Figure A-24](#)).
- Length matching:
 - For bus or traces at frequencies lesser than 10 MHz: the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 25 mm.
 - For bus or traces at frequencies greater than 10 MHz: the trace length matching (maximum length difference between the longest and the shortest lines) must be less than 2.5 mm.

- Characteristic impedance
 - Characteristic impedance for single-ended interfaces is recommended to be between 30 and 60 Ω and in some specific cases between 40 and 55 Ω to minimize overshoot and undershoot on far-end loads.

A.3.2 Single-Ended PCB Guideline in OMAP4

A.3.2.1 OMAP4470 Single-Ended Interfaces—PCB Guideline

The following interfaces follow the general guideline of single-ended interfaces.

A.3.2.1.1 OMAP4470 Single-Ended Interfaces—GPMC PCB Guideline

A.3.2.1.20 OMAP4470 Single-Ended Interfaces—KeyPad PCB Guideline

NOTE

Here is the routing of the keypad row and column signals (for all keypad signals):

- The trace impedance must be between 20 Ω and 70 Ω .
 - Maximum trace length is equal to 20 cm.
-

A.3.2.1.21 OMAP4470 Single-Ended Interfaces—DM Timer PCB Guideline

NOTE

Here is the routing for all DM timer signals:

- The trace impedance must be between 20 Ω and 70 Ω .
 - Maximum trace length is equal to 7 cm.
-

CAUTION

System level ESD results are dependent on the components being connected to the product.

Part numbers that are different than the reference board specification (see [Table A-4](#)) are not assured to meet system level ESD requirements.

Table A-4. SDMMC Component Reference

INTERFACE	DEVICE	SUPPLIER	PART NUMBER
SDMMC	TVS	TI	TPD6E001RSE
	C	Murata	[0.1 uF/10V/0402] GRM155R71A104KA0

A.3.2.2.2 ESD Implementation—KeyPAD Interface

NOTE

For more information on system ESD, see [Section A.2.4, System ESD Generic Guideline](#).

To protect against electromagnetic interference (EMI), the ESD recommendation is to implement an EMI filter array. An alternate solution is to use ESD protection array. To further enhance ESD robustness, 5-Ω series resistors may be placed in between protection device and OMAP4470 keypad. ESD protection device must exhibit a low turn-on resistance ($\leq 1 \Omega$ typical).

Table A-5. Keypad Components Reference

INTERFACE	DEVICE	SUPPLIER	PART NUMBER
Keypad	EMIF	TI	TPD6F003

A.3.2.2.3 ESD Implementation—JTAG and cJTAG Interfaces

NOTE

For more information on system ESD, see [Section A.2.4, System ESD Generic Guideline](#).

NOTE

For more information on JTAG and cJTAG far end load, trace length and characteristic impedance, see [Section 5.8.2, JTAG Interface \(JTAG\)](#), or [Section 5.8.3, cJTAG Interface \(cJTAG\)](#).

For a system having JTAG test points accessible to end users (example when located under battery pack for handheld device), system ESD protection can be achieved using TPD6E001 to target 8 kV direct contact. Additional resistors of 3.9 Ω could be used to strengthen ESD robustness.

ESD protection device must exhibit a low turn-on resistance ($\leq 1 \Omega$ typical).

A.4 Differential Interface PCB Guidelines

A.4.1 General Routing Guidelines

The following general routing guidelines describe the routing guidelines for MIPI differential lanes.

Each guideline is depicted in detail in [Section A.4.2, Three-step Design and Validation Methodology for OMAP Boards](#).

For more information, you can also refer to the MIPI D-PHY specification v1.00.

- As much as possible, no other high frequency signals must be routed in close proximity to the differential pair.
- Must be routed as differential traces on the same layer. The trace width and spacing must be chosen to yield a 100-Ω differential impedance, along with a 50-Ω single-ended impedance for each signal of the pair.
- Due to the fact that the MIPI signals are used for low-power, single-ended signaling in addition to their high-speed differential implementation, the pairs must be loosely coupled.
- The flight time for the signals must not exceed 2 ns, which assuming a PCB constructed from standard FR-4 material, would imply a maximum trace length of approximately 10" (25.4 cm).
- Minimize external components on differential lanes (like external ESD, probe points).
- Through-hole pins are not recommended.
- Differential lanes mustn't cross image planes (ground planes).

- No sharp bend on differential lanes.
- Number of vias on the differential pairs must be minimized.
- Shielded routing is to be promoted as much as possible (for instance, signals must be routed on internal layers that are inside power and/or ground planes).

A.4.2 Three-step Design and Validation Methodology for OMAP Boards

A.4.2.1 Three-step Design and Validation Methodology—General Guidelines

The following requirements are not dependent on the IO names, such as CSI, DSI, HDMI, and USB, because the differential interfaces basically have the same requirements for the PCB lines.

On the other hand, the PCB requirement is dependent on the operating speed of the circuits because the length mismatch is given by the bit time (UI) of the signal.

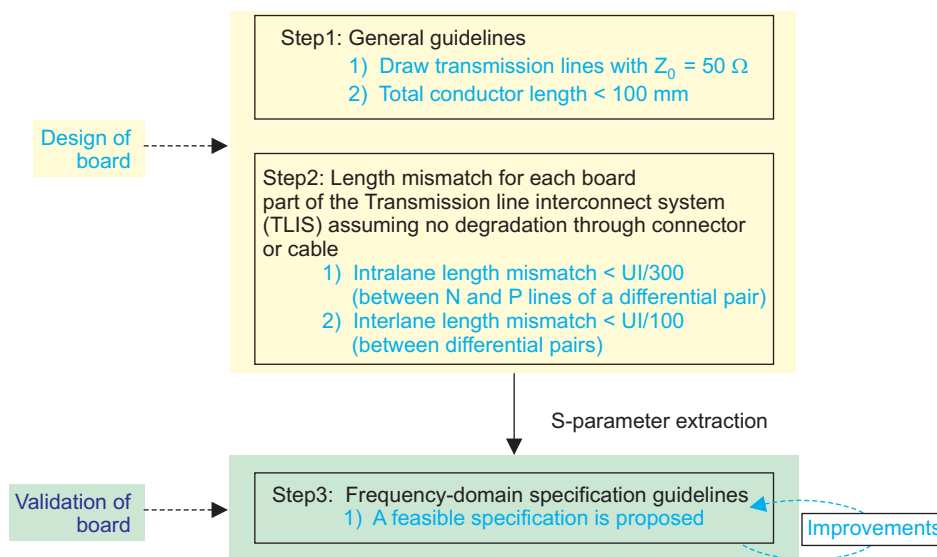

The PCB guidelines for the OMAP differential interfaces are based on the three-step design and validation methodology in [Figure A-22](#).

The three-step methodology provides a guideline for the design of the PCB differential lines as well as a validation methodology of the designed differential lines to ensure that the PCB differential lines are designed well.

The first step is the general guidelines showing the ideal condition of the PCB differential lines. The first step is important for the PCB designers because it shows the general requirements for the PCB differential lines.

The second step is the length mismatch requirement to satisfy the system-level specification of the differential interfaces along with the OMAP package. Step 1 and Step 2 comprise the design guideline.

As a validation methodology, the third step is the frequency-domain specification of the differential lines that the lines need to satisfy in the frequency domain. If the PCB lines satisfy the frequency-domain specification, the design is done. Otherwise, the lines need to be improved.

SWPS040-183

Figure A-22. Summary of Three-step PCB Design and Validation Methodology for OMAP4 Differential Interfaces

The differential interfaces are connected from the OMAP circuit to the device circuit through the OMAP package, OMAP board, cable, device board, and device package.

In this section, the guidelines for the OMAP PCB differential lines are presented.

The PCB guidelines are developed to align the OMAP board with the OMAP package since the specification of the differential interfaces has one consolidated requirement for the package and board, which can be tested by measurement equipment such as oscilloscopes.

Figure A-23. Transmission Line Interconnect System (TLIS)

The ideal electrical condition of the PCB differential lines is basically the same for all the OMAP differential interfaces, which are shown as:

- Single-ended $Z_0 = 50 \Omega$, differential $Z_0 = 100 \Omega$
- Negligible length mismatch among differential lines.

The loss of the differential lines is not a big concern because the loss causes intersymbol interference (ISI) that can be compensated by equalization techniques. But, for the differential interfaces without equalization techniques, the length is recommended to be kept at a minimum to have a smaller ISI. For the OMAP board, we recommend that the length of the PCB differential lines be less than 100 mm.

In the above requirements, the length mismatch requirement is not clear. It is always better to have smaller length mismatch. But, how small is good enough? To clarify the length mismatch requirement for the OMAP board lines, we recommend using the below conditions:

- Intralane length mismatch $< (UI / 300)$
- Interlane length mismatch $< (UI / 100)$

UI is the bit time of the signal. The intralane length mismatch is the length mismatch between the N and P lines of a differential pair, and the interlane length mismatch is between the differential pairs.

A.4.2.2 Step 1: General Guidelines for OMAP Boards

NOTE

The OMAP differential interfaces, such as CSI and DSI, require the PCB differential lines with the following two conditions:

- Single-ended $Z_0 = 50 \Omega$, differential $Z_0 = 100 \Omega$
- Total conductor length $< 100 \text{ mm}$

The total conductor length is limited for the PCB lines not to have too much intersymbol interference (ISI). In general, the conductor length is recommended to be kept at a minimum to have a smaller ISI.

In Step 1, the general rule of thumb for the space $S = 2 * W$ is not designated. It is because although the $S = 2 * W$ rule is a good rule of thumb, it is not always the best solution.

Sometimes, the lines with ground guard between the lines are better. It remains up to the PCB designers whether the $S = 2 * W$ rule is used or not.

However, the electrical performance needs to be better than the frequency-domain specification in Step 3. The $S = 2 * W$ rule is generally recommended.

Figure A-24. Ground Guard Illustration

A.4.2.3 Step 2: Length Mismatch Guidelines for OMAP Boards

NOTE

The guidelines for the length mismatch of the PCB differential lines are presented as:

- Intralane skew between N and P < (UI / 300)
- Interlane skew between differential pairs < (UI / 100)

UI is the bit time of the signal. The intralane length mismatch is the length mismatch between the N and P lines of a differential pair, and the interlane length mismatch between the differential pairs.

The time skew can be converted to the physical length with the below equation as 500 μm for the intralane skew and 1500 μm for the interlane skew for a speed of 1000 Mbps, based on the dielectric material of $E_r = 4.0$.

$$Length = \frac{3 \times 10^8 (m/s)}{\sqrt{4.0}} \cdot (\text{time interval}) \quad [m]$$

SWPS040-e003

The length mismatch requirement can be formatted in Table A-7 as (assuming operating speed is 1000 Mbps):

Table A-7. Length Mismatch Guidelines of Differential Lines⁽¹⁾

PARAMETER	TYPICAL VALUE	UNIT
Operating Speed	1000	Mbps
UI (bit time)	1000	ps
Intralane skew (UI / 300)	3.3	ps
Length between N and P traces	0.5	mm
Interlane Skew (UI / 100)	10	ps
Length between pairs	1.5	mm

(1) The interlane skew is actually applied to data and clock lines.

Step 1 and Step 2 comprise the design guidelines for the PCB differential lines. The PCB designers can draw the PCB differential lines satisfying the Step 1 and Step 2 requirements.

Then, Step 3 in Section A.4.2.4 is a validation methodology for the designed PCB differential lines checking whether the electrical performance of the differential lines is good enough.

A.4.2.4 Step 3: Frequency-domain Specification Guidelines for OMAP Boards

Although the PCB designers will draw the lines carefully with the Step 1 and Step 2 guidelines, the lines can have poor electrical performance due to many reasons.

The vertical connections such as vias and nonuniform line connection such as the escape traces can degrade the electrical performance of the differential lines.

In addition, the ground design around the lines can also affect the electrical performance. So, to ensure that the differential lines are good, the frequency-domain behavior of the lines needs to be checked and compared to the frequency-domain specification given here.

Then, the S-parameters needs to be extracted with a 3D Maxwell Equations' solver such as high-frequency structure simulator (HFSS) or equivalent. The 2D and 2.5D Maxwell Equations' solvers are not recommended to extract the S-parameter of the differential lines because they could not catch the effect of the vias.

The frequency-domain specification is the frequency-domain behavior of a differential pair that has good electrical performance.

The frequency-domain specification for the PCB differential lines is made up of the intralane frequency-domain specification and the interlane frequency-domain specification, as shown below:

1. Intralane frequency-domain specification
 - Differential-mode characteristics: S_{dd12} , S_{dd11} / S_{dd22}
 - Common-mode characteristics: S_{cc11} / S_{cc22}
 - Mode-conversion characteristics: S_{cd11} , S_{cd12} , S_{cd21} , S_{cd22} , S_{dc11} , S_{dc12} , S_{dc21} , S_{dc22}
2. Interlane frequency-domain specification
 - Differential-mode characteristics: S_{dd11} / S_{dd22}
 - Common-mode characteristics: S_{cc11} / S_{cc22}

A.4.2.4.1 Intralane Frequency-domain Specification

The port assignment for the intralane frequency domain specification test is shown in [Figure A-25](#). For the intralane specification test, the four ports are assigned to the N and P lines of a differential pair. The S-parameters can be extracted from dc to 5 GHz.

SWPS040-186

Figure A-25. Port Assignment for the Intralane Frequency-domain Specification

A.4.2.4.1.1 S_{dd12}

S_{dd12} represents the differential-mode insertion loss of the differential line. Bigger S_{dd12} indicates that the transmission line has smaller loss. Since the insertion loss is proportional to the length of the lossy transmission line, S_{dd12} will be smaller as the length increases.

So for the OMAP board, we recommend that the total conductor length be smaller than 100 mm for the PCB differential lines, whose electrical behavior is similar to that in [Figure A-26](#). The ideal lossless differential line has $S_{dd12} = 1$, which is 0 dB. The S_{dd12} is recommended to be larger than the below line from dc to 5 GHz. If the designed differential lines have lower S_{dd12} than the specification, the lines can be improved by reducing the length of the differential lines.

Figure A-26. Intralane Sdd12 Frequency-domain Specification

A.4.2.4.1.2 Sdd11 / Sdd22

Sdd11 / Sdd22 represents the differential-mode return loss of the differential line. Smaller Sdd11 / Sdd22 indicates that the transmission line has smaller return loss. The ideal differential line with $Z_0 = 50 \Omega$ ($Z_{0diff} = 100 \Omega$) has Sdd11 / Sdd22 = 0, which is $-\infty$ dB. Sdd11 / Sdd22 is tightly related to the differential-mode characteristic impedance of the differential line. Sdd11 / Sdd22 is recommended to be smaller than the below line.

Figure A-27. Sdd11/Sd22 Frequency-domain Specification

If the designed differential lines have higher Sdd11 / Sdd22 than the specification, the differential lines can be improved by adjusting the space distance between the N and P lines of a differential pair. It is because the differential-mode characteristic impedance is mostly affected by the space.

A.4.2.4.1.3 Scc11 / Scc22

Scc11 / Scc22 represents the common-mode return loss of the differential transmission line. The smaller of Scc11 / Scc22 indicates the transmission line has smaller return loss. Scc11 / Scc22 is tightly related to the common-mode characteristic impedance of the differential line. The ideal differential line with $Z_0 = 50 \Omega$ ($Z_{0\text{diff}} = 100 \Omega$) has Scc11 / Scc22 = 0, which is $-\infty$ dB. Scc11 / Scc22 is recommended to be smaller than the line below.

Figure A-28. Intralane Scc11/Scc22 Frequency-domain Specification

If the designed differential lines have higher Scc11 / Scc22 than the specification, the differential lines can be improved by changing the power and ground nets around the lines. It is because the common-mode characteristic impedance is mostly affected by the power and ground nets around.

A.4.2.4.1.4 Scd11, Scd12, Scd21, Scd22, Sdc11, Sdc12, Sdc21, Sdc22

Scd11, Scd12, Scd21, Scd22, Sdc11, Sdc12, Sdc21 and Sdc22 represent the mode-conversion factors between the common-mode signal and the differential-mode signal. The lower number means that the conversion is smaller. They are recommended to be smaller than the below line. If the designed differential lines have higher mode-conversion factors than the specification, the differential lines can be improved by improving the symmetry between the N and P lines of a differential pair. If the two lines are perfectly symmetric, the mode-conversion factors will be 0, which is $-\infty$ dB.

Figure A-29. Intralane Scd11, Scd12, Sdc11, Sdc12 Frequency-domain Specification

A.4.2.4.2 Interlane Frequency-domain Specification

In this section, the interlane frequency-domain specification is described between differential lines. In the interlane specification test, one line is chosen from a differential pair and the other line is chosen from another differential pair, as shown in Figure A-30. Then, the S-parameters will be extracted from dc to 5 GHz with a 3D Maxwell Equation solver such as high-frequency structure simulator (HFSS) or equivalent, and the frequency-domain behavior will be compared to the frequency-domain specification given here. Since it is desired that the crosstalk between differential pairs be smaller, the differential-mode and common-mode characteristics requirement is stricter than the intralane specification.

Figure A-30. Port Assignment for the Interlane Frequency-domain Specification

A.4.2.4.2.1 Sdd11 / Sdd22

Sdd11 / Sdd22 represents the differential-mode return loss of the two lines. The ideal condition for the interlane specification is to place the two lines far away from each other not to have any crosstalk. Then, the ideal interlane Sdd11 / Sdd22 = 0, which is $-\infty$ dB. Sdd11 / Sdd22 is recommended to be smaller than the below line.

Figure A-31. Interlane Sdd11 / Sdd22 Frequency-domain Specification

If the designed differential lines have higher Sdd11 / Sdd22 than the specification, the differential lines can be improved by two ways. One way is to adjust the space distance between the N and P lines of a differential pair, and the other way is to put ground/power nets between the two lines to reduce the crosstalk.

A.4.2.4.2.2 Scc11 / Scc22

Scc11 / Scc22 represents the common-mode return loss of the two lines. The ideal interlane Scc11 / Scc22 = 0, which is $-\infty$ dB. Scc11 / Scc22 is recommended to be smaller than the below line. If the designed differential lines have higher Scc11 / Scc22 than the specification, the differential lines can be improved by putting ground/power nets between the two lines.

Figure A-32. Interlane Scc11 / Scc22 Frequency-domain Specification

A.4.3 MIPI D-PHY PCB Guidelines in OMAP4

NOTE

The PCB general guidelines mentioned in this section are given for the transmission line interconnect present on the OMAP board (between OMAP balls and a connector for example).

For the PCB guidelines of the total interconnect (between TX balls and RX balls), you can refer to the MIPI D-PHY specification v1.00.

The MIPI D-PHY signals include the CSI21, CSI22, DSI1_1, and DSI1_2 interfaces to or from the OMAP4470. For more information regarding the MIPI-PHY signals and corresponding balls, see [Section 2.4, Signal Descriptions](#).

In next section, the PCB guidelines of the following six differential interfaces are presented.

- CSI21 and CSI22 MIPI CSI-2 @ 1.0 Gbps
- CSI21 and CSI22 MIPI CSI-2 @ 824 Mbps
- CSI21 and CSI22 MIPI CSI-2 @ 800 Mbps
- DSI1_1 and DSI1_2 MIPI DSI1 @ 900 Mbps
- DSI1_1 and DSI1_2 MIPI DSI1 @ 824 Mbps

A.4.3.1 CSI21 and CSI22 MIPI CSI-2 @ 1 Gbps (Up to 3 Data Lanes, OPP100), @ 824 Mbps (Up to 4 Data Lanes, OPP100), @ 800 Mbps (Up to 4 Data Lanes, OPP50) Device PCB Guidelines

CAUTION

If the skew degradation due to the interconnect (from the output transmitter ball to the input receiver ball) between the clock and the data lanes is less than ± 170 ps (instead of ± 200 ps in the MIPI D-PHY specification), then 1 Gbps per data lane is achievable with 4 data lanes at OPP100 operating point. This must be met for an interconnect length less than 10 cm.

NOTE

The CSI21 and CSI22 MIPI CSI-2 application timings are described in [Section 5.5.1.1, Camera Serial Interface \(CSI2\)](#) (especially, the timing conditions are specified in the “Timing Conditions” tables of this section).

First, the following PCB guidelines for CSI2 working up to 1.0 Gbps are presented based on the three-step design and validation methodology described in [Section A.4.2, Three-step Design and Validation Methodology for OMAP Boards](#).

For the design of the PCB differential lines on the OMAP board, the PCB designers need to keep in mind the requirements of Step 1 and Step 2: the characteristic impedance must be 50Ω , the total length must be smaller than 100 mm, and the length mismatch requirements must be satisfied.

Then, after the PCB design is finished, the S-parameters of the PCB differential lines will be extracted with a 3D Maxwell Equation Solver such as high-frequency structure simulator (HFSS) or equivalent, and compared to the frequency-domain specification as outlined in Step 3 of design methodology. If the PCB lines satisfy the frequency-domain spec, the design is done. Otherwise, the design needs to be improved.

A.4.3.1.1 Step 1: General Guidelines

The general guidelines for the PCB differential lines of CSI2 are given as:

- Single-ended $Z_0 = 50 \Omega$
- Total conductor length on OMAP board < 100 mm.

In the step, the general rule of thumb for the space $S = 2 * W$ is not designated (see [Figure A-24](#)). It is because although the $S = 2 * W$ rule is a good rule of thumb, it is not always the best solution. The electrical performance will be checked with the frequency-domain specification in Step 3. Even though the designers does not follow the $S = 2 * W$ rule, the differential lines are ok if the lines satisfy the frequency-domain specification in Step 3.

A.4.3.1.2 Step 2: Length Mismatch Guidelines

A.4.3.1.2.1 Step 2: Length Mismatch Guidelines—CSI21 and CSI22 MIPI CSI-2 @ 1.0 Gbps

The guidelines of the length mismatch for CSI-2 are presented in [Table A-8](#). The intralane length mismatch must be less than 0.5 mm, and the interlane length mismatch must be less than 1.5 mm.

Table A-8. Length Mismatch Guidelines for CSI-2 @ 1.0 Gbps

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	1000	Mbps
UI (bit time)	1000	ps
Intralane skew (UI / 300)	3	ps
Length between N and P traces	0.5	mm
Interlane skew (UI / 100)	10	ps
Length between pairs	1.5	mm

A.4.3.1.2.2 Step 2: Length Mismatch Guidelines—CSI21 and CSI22 MIPI CSI-2 @ 824 Mbps

The guidelines of the length mismatch for CSI-2 are presented in [Table A-9](#).

Table A-9. Length Mismatch Guidelines for CSI-2 @ 824 Mbps

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	824	Mbps
UI (bit time)	1213	ps
Intralane skew (UI / 300)	4	ps
Length between N and P traces	0.6	mm
Interlane skew (UI / 100)	12	ps
Length between pairs	1.8	mm

A.4.3.1.2.3 Step 2: Length Mismatch Guidelines—CSI21 and CSI22 MIPI CSI-2 @ 800 Mbps

The guidelines of the length mismatch for CSI-2 are presented in [Table A-10](#). The intralane length mismatch must be less than 0.6 mm, and the interlane length mismatch must be less than 1.8 mm.

Table A-10. Length Mismatch Guidelines for CSI-2 @ 800 Mbps

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	800	Mbps
UI (bit time)	1250	ps
Intralane skew (UI / 300)	4	ps
Length between N and P traces	0.6	mm
Interlane skew (UI / 100)	12	ps
Length between pairs	1.8	mm

A.4.3.1.3 Step 3: Frequency-domain Specification Guidelines

With the information in Step 1 and Step 2, the PCB designers can draw the PCB differential lines satisfying the Step 1 and Step 2 requirements.

However, although the PCB designers draw the lines carefully, the lines can have poor electrical performance due to many reasons.

The vertical connections such as vias and nonuniform line connection can degrade the electrical performance of the differential lines. And the ground design around the lines can also affect the electrical performance.

So, to ensure that the differential lines are well designed, the frequency-domain behavior must be compared to the frequency-domain specification in [Section A.4.2.4, Step 3: Frequency-domain Specification Guidelines for OMAP Boards](#).

1. Intralane frequency-domain specification
 - Differential-mode characteristics: Sdd12, Sdd11 / Sdd22
 - Common-mode characteristics: Scc11/Scc22
 - Mode-conversion characteristics: Scd11, Scd12, Scd21, Scd22, Sdc11, Sdc12, Sdc21, Sdc22
2. Interlane frequency-domain specification
 - Differential-mode characteristics: Sdd11 / Sdd22
 - Common-mode characteristics: Scc11 / Scc22

A.4.3.2 DSI1_1 and DSI1_2 MIPI DSI1 @ 900 Mbps (Up to 3 Data Lanes), @ 824 Mbps (Up to 4 Data Lanes) Device PCB Guideline

NOTE

The DSI1_1 and DSI1_2 MIPI DSI1 application timings are described in [Section 5.5.2.3, Display Serial Interface \(DSI\)](#) (especially, the timing conditions specified in the “Timing Conditions” tables of this section).

NOTE

If the skew degradation due to the total interconnect (from the transmitter ball to the receiver ball) between the clock and the data lanes is less than ± 192 ps (instead of ± 222 ps in the MIPI D-PHY specification) then 900 Mbps (450 MHz) per data lane is achievable with 4 data lanes at OPP100 and OPP50 operating points.

In this section, the PCB guidelines for DSI1 working up to 900 Mbps are presented based on the three-step design and validation methodology described on [Section A.4.2, Three-step Design and Validation Methodology for OMAP Boards](#).

A.4.3.2.1 Step 1: General Guidelines

The general guidelines for the PCB differential lines of DSI1 are given as:

- Single-ended $Z_0 = 50 \Omega$
- Total conductor length on OMAP board < 100 mm.

In the step, the general rule of thumb for the space $S = 2 * W$ is not designated (see [Figure A-24](#)). It is because although the $S = 2 * W$ rule is a good rule of thumb, it is not always the best solution. The electrical performance will be checked with the frequency-domain specification in Step 3. Even though the designers does not follow the $S = 2 * W$ rule, the differential lines are ok if the lines satisfy the frequency-domain specification in Step 3.

A.4.3.2.2 Step 2: Length Mismatch Guidelines

A.4.3.2.2.1 Step 2: Length Mismatch Guidelines—DSI1_1 and DSI1_2 MIPI DSI1 @ 900 Mbps

The guidelines of the length mismatch for DSI1 are presented in [Table A-11](#).

Table A-11. Length Mismatch Guidelines for DSI1 @ 900 Mbps

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	900	Mbps
UI (bit time)	1111	ps
Intralane skew (UI / 300)	3.7	ps
Length between N and P traces	0.55	mm
Interlane skew (UI / 100)	11.1	ps
Length between pairs	1.66	mm

A.4.3.2.2.2 Step 2: Length Mismatch Guidelines—DSI1_1 and DSI1_2 MIPI DSI1 @ 824 Mbps

The guidelines of the length mismatch for DSI1 are presented in [Table A-12](#). The intralane length mismatch must be less than 0.6 mm, and the interlane length mismatch must be less than 1.8 mm.

Table A-12. Length Mismatch Guidelines for DSI1 @ 824 Mbps

PARAMETER	TYPICAL VALUE	UNIT
Operating speed	824	Mbps
UI (bit time)	1213.59	ps
Intralane skew (UI / 300)	4	ps
Length between N and P traces	0.6	mm
Interlane skew (UI / 100)	12	ps
Length between pairs	1.8	mm

A.4.3.2.3 Step 3: Frequency-domain Specification Guidelines

The frequency-domain specification is given in [Section A.4.2.4, Step 3: Frequency-domain Specification Guidelines for OMAP Boards](#).

A.4.4 USB A0 PHY Interface in OMAP4

The USB A0 interface DP and DM signals are the positive and negative signals from the USB transceiver contained within the OMAP4470. These signals (DP or D+ (usba0_otg_dp) and DM or D– (usba0_otg_dm)) are connected to the OMAP4470 on balls B5 and B4, respectively.

[Section A.4.4.1](#) describes the USB A0 DP and DM PCB guidelines recommended for the OMAP4470 device.

A.4.4.1 USB A0 PHY PCB Guideline

The length of DP / DM traces measured between OMAP4 and the common mode choke must follow the requirements detailed in [Table A-13](#) to ensure that the reflections always hit the eye diagram at an optimum point in the unit interval.

NOTE

Distance between the common mode choke filter (ACM2012H in [Figure A-33](#)) and IEC ESD protection (TPD4S012 in [Figure A-33](#)) device must be as short as possible: < 30 ps

Similarly, the distance between IEC ESD protection device (TPD4S012DRY in [Figure A-33](#)) and the USB connector (Mini A-B receptacle in [Figure A-33](#)) must be as short as possible: < 30 ps

USB standard connector must be used (micro-AB or mini-AB)

USB grounds must be shorted to the board ground plane with minimum routing (only VIA must be used to connect to ground plane to avoid loop creation and so to reduce electromagnetic interference (EMI) effect.

Table A-13. USB Optimized Trace Length

PARAMETER		MIN	TYP	MAX	UNIT
DP and DM differential impedance		80	90	100	Ω
DP and DM individual impedance		45		49	Ω
Trace length delay for 1 mm				6.66	ps
Recommended intralane mismatch between DP and DM	Distance			1	mm
	Skew			6.66	ps
HS operating speed			480		Mbps
Unit interval (bit time)			2080		ps
Recommended board delay for optimum eye aperture between OMAP and CMF-ESD ⁽¹⁾		510	530	680	ps
Recommended distance between OMAP and CMF-ESD ⁽²⁾		76.58	79.58	102.10	mm

(1) The board delay is the delay between DP and DM OMAP4 ball levels (usba0_otg_dp and usba0_otg_dm) and the common mode choke filter (CMF, ACM2012H).

For more information see [Figure A-33](#), *USB Implementation Proposal with TWL6032 PMIC*.

(2) The board distance between the DP and DM OMAP ball level (usba0_otg_dp and usba0_otg_dm) and the common mode choke filter (CMF, ACM2012H) is calculated based on the trace length delay for 1 mm (6.66 ps).

If the above recommended requirement are not possible on customer board, the following requirements are also possible between the OMAP and the common mode choke. These values have been computed to minimize the bad effect of the reflection on the eye diagram.

Table A-14. USB Trace Length With N Multiple

PARAMETER		MIN	TYP	MAX	UNIT
Unit interval (480 Mbps)			2080		ps
Recommended board characteristics for optimum eye aperture ⁽¹⁾⁽²⁾⁽³⁾	N = 0 (Recommended Value)	510	530	680	ps
	N = 1	1550	1570	1720	ps
	N = 2	2590	2610	2760	ps
	N = 3	3630	3650	3800	ps

- (1) The board delay is the delay between DP and DM OMAP ball levels (usba0_otg_dp and usba0_otg_dm) and the common mode choke filter (CMF, ACM2012H). For more information see [Figure A-33](#), *USB Implementation Proposal with TWL6032 PMIC*.
- (2) The possible board delay value is calculated as follows:
 $N * \frac{1}{2} * UI + \text{Optimum Board delay (530 ps)}$, with N = 0, 1, 2, or 3.
- (3) The board distance between the DP and DM OMAP ball level (usba0_otg_dp and usba0_otg_dm) and the common mode choke filter (CMF, ACM2012H) is calculated based on the trace length delay for 1 mm (6.66 ps).

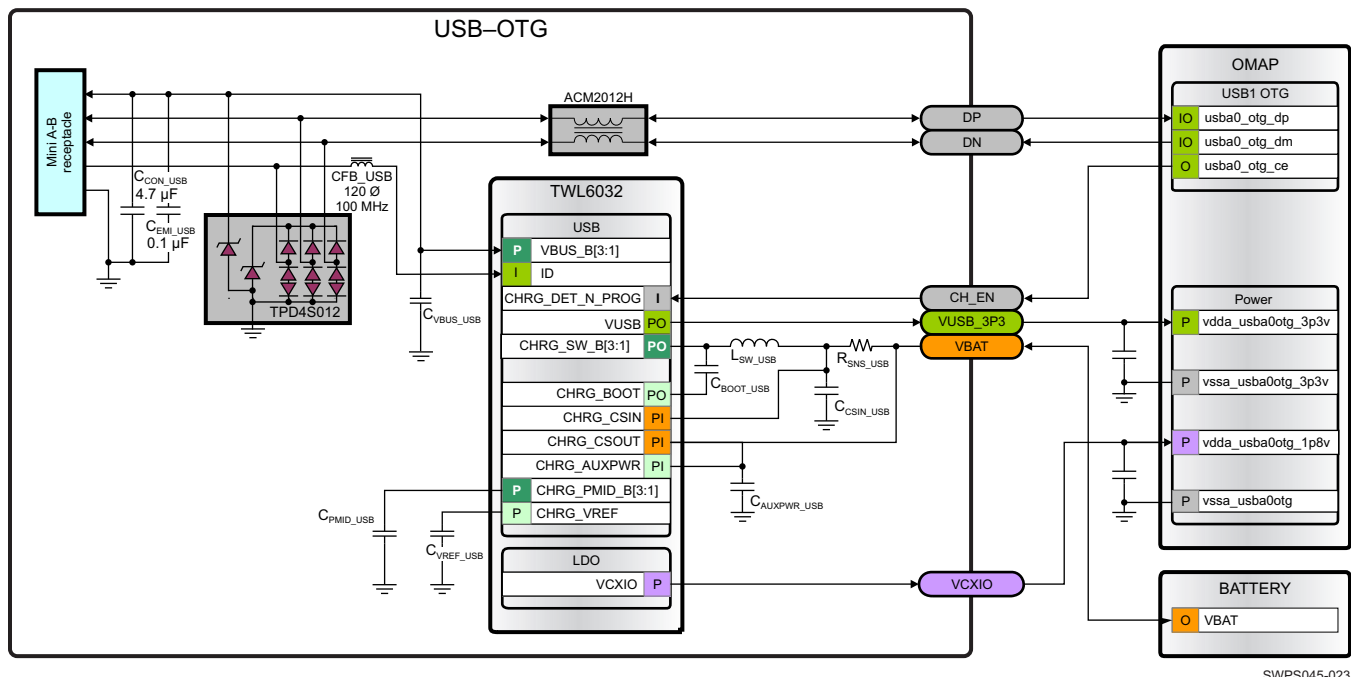

NOTE

Remember that the distance between the common mode choke filter (ACM2012H in [Figure A-33](#)) and IEC ESD protection (TPD4S012 in [Figure A-33](#)) device must be as short as possible (< 30 ps).

Similarly, for the distance between IEC ESD protection device (TPD4S012DRY in [Figure A-33](#)) and the USB connector (Mini A-B receptacle in [Figure A-33](#)) must be as short as possible (< 30 ps).

A.4.4.2 USB A0 PHY Implementation Example

[Figure A-33](#) proposes an example of USB A0 PHY implementation with a TWL6032 PMIC and a TPD4S012 component.

SWPS045-023

Figure A-33. USB Implementation Proposal with TWL6032 PMIC

A.4.4.3 ESD Implementation—USBA0 PHY

NOTE

For more information on system ESD, see [Section A.2.4, System ESD Generic Guideline](#).

- ESD: USB standard connector has 4 pins: DP and DM attached to OMAP4470 and ID and VBUS pins attached to the TWL6032 PMIC IC device.
 - For DP and DM pins:
 - ESD protection device must be preferably an array with a low capacitance (≤ 1.0 pF typical) and a low turn-on resistance ($R_{DYN} \leq 1.2 \Omega$) while VBUS pin is designed to tolerate 20 V.
 - Common mode choke filter (CMF) must be placed between the ESD protection and the OMAP4470 to minimize electromagnetic interference (EMI).
 - If CMF is implemented, no isolation resistor is required and system ESD is greatly strengthened.
 - DC series resistance of the CMF needs to be 1 Ω maximum. Common mode bandwidth (Scc21) must not exceed 50 MHz.
 - For VBUS and ID pins:
 - For the VBUS pin, a broadband decoupling capacitor reduces noise in the VBUS power line. In addition, a large decoupling capacitor will absorb the ESD pulse energy.
 - For the ID pin, a chip ferrite bead placed between the ESD protection and the PMIC is recommended.

NOTE

System level ESD results (following IEC 61000-4-2 standard) are dependent on the components being connected to the product.

Part numbers that are different than the reference board specification described in [Table A-15](#) are not assured to meet system level ESD requirements.

Table A-15. USB Component References

INTERFACE	DEVICE	SUPPLIER	PART NUMBER
USBPHY	TVS	TI	TPD4S012DRY
	CMF	TDK	ACM2012H-900-2P
	CFB	Murata	BLM15PD121SN1
	C	Murata	[1 μ F / 25V / 0603] GRM188R71E105KA12D
	EMICAP	Murata	[0.1 μ F / 16V] NFM18PC104R1C3

A.4.5 HDMI Interface in OMAP4

NOTE

More information on HDMI is not available in the public domain.

NOTE

For more information on system ESD, see [Section A.2.4, System ESD Generic Guideline](#).

A.5 Clock Guidelines

NOTE

For more information on system clocks, see [Section 4, Clock Specifications](#).

A.5.1 32-kHz Oscillator Routing

When designing the printed-circuit board:

- Keep the crystal as close as possible to the crystal pins X1 and X2.
- Keep the trace lengths short and small to reduce capacitor loading and prevent unwanted noise pickup.
- Place a guard ring around the crystal and tie the ring to ground to help isolate the crystal from unwanted noise pickup.
- Keep all signals out from beneath the crystal and the X1 and X2 pins to prevent noise coupling.
- Finally, an additional local ground plane on an adjacent PCB layer can be added under the crystal to shield it from unwanted pickup from traces on other layers of the board. This plane must be isolated from the regular PCB ground plane and tied to the GND pin of the RTC. The plane mustn't be any larger than the perimeter of the guard ring. Make sure that this ground plane doesn't contribute to significant capacitance (a few pF) between the signal line and ground on the connections that run from X1 and X2 to the crystal.

Figure A-34. Slow Clock PCB Requirements

A.5.2 Oscillator Ground Connection

Although the impedance of a ground plane is low it is, of course, not zero. Therefore, any noise current in the ground plane causes a voltage drop in the ground. If the two capacitors of the oscillator are connected directly to the ground plane, the voltage drop in the red portion of the ground in [Figure A-35](#) will be overlaid to the oscillator signals. If the noise related voltage drop is big enough, the oscillator may be disturbed.

Figure A-35. Poor Oscillator Ground Connection

The overlay of ground noise may be avoided by providing an extra ground trace for the oscillator ground as indicated in green in [Figure A-36](#). Even in a multilayer PCB this is a powerful measure to improve the susceptibility of the oscillator.

Figure A-36. Optimized Oscillator Ground Connection

A.5.3 Electromagnetic Interference (EMI) Prevention in Clock Distribution

The following section gives a series of guidelines and methods to reduce EMI. Here are some of these methods:

- Place the clock drivers near the center of the PCB rather than at the periphery. A periphery location increases the magnetic dipole moments.
- For clock traces that are routed on the surface plane, to further reduce EMI, it is better to route parallel ground traces on either side of the clock trace. However, it is even better to place the clock traces in the layer in between ground and the Vcc plane.
- Not use right angles or 'T' crosses. Right angles increase trace capacitance and also add an impedance discontinuity that effect the signal degradation.
- Impedance must be matched as closely as possible. Usually cases impedance mismatches cause emissions. Signal integrity mainly depends on impedance matching.
- Do not run long clock traces parallel to each other because they affect crosstalk that contributes to EMI.
- It is a good idea to ensure that the spacing between traces is at least equal to the trace width.

A.6 Ground Guidelines

A.6.1 Guard Ring on PCB Edges

The mayor advantage of a multilayer PCB with ground-plane is the ground return path below each and every signal or power trace.

As shown in [Figure A-37](#) the field lines of the signal return to PCB ground as long as an “infinite” ground is available.

Traces near the PCB-edges do not have this “infinite” ground and therefore may radiate more than others. Thus signals (clocks) or power traces (core power) identified to be critical must not be routed in the vicinity of PCB-edges, or, if not avoidable, must be accompanied by a guard ring on the PCB edge.

SWPS040-199

Figure A-37. Field Lines of a Signal Above Ground

SWPS040-200

Figure A-38. Guard Ring Routing

The intention of the guard ring is that HF-energy, that otherwise would have been emitted from the PCB-edge, is reflected back into the board where it partially will be absorbed. For this purpose ground traces on the borders of all layers (including power layer) must be applied as shown in [Figure A-38](#).

As these traces must have the same (HF-) potential as the ground plane they must be connected to the ground plane at least every 10 mm.

A.6.2 Analog and Digital Ground

For the optimum solution, the AGND and the DGND planes must be connected together at the power supply source in a same point. This ensures that both planes are at the same potential, while the transfer of noise from the digital to the analog domain is minimized.

B Glossary

B.1 Glossary

AC or ac	Alternating Current
APLL	Analog Phase-Locked Loop
ARM	Advanced RISC Machine
ASIC	Application-Specific Integrated Circuit
BG	Bandgap
CAM	Parallel Camera Interface
CCP	Compact Camera Port
CDM	Charged Device Modem
cJTAG	Component Joint Test Action Group, IEEE 1149.1 Standard
CM	Clock Manager
CMOS	Complementary Metal Oxide Silicon
CSI	Camera Serial Interface
DAC	Digital-to-Analog Converter
DC or dc	Direct Current
DDR	Double Data Rate
DISPC	Display Controller
DLL	Delay-Locked Loop
DMA	Direct Memory Access
DMIC	Digital Microphone
DPLL	Digital Phase-Locked Loop
DSI	Display Serial Interface
DSS	Display Subsystem
eFuse	Electrical Fuse
EMIF	External Memory Interface
EMU	Emulation
ESD	Electrostatic Discharge
ESR	Equivalent series resistance
ETK	Embedded Trace kit
ETM	Embedded Trace Macrocell
FIR	Fast Infrared
FSR	Full-Scale Range
FSUSB	Full-Speed Universal Serial Bus
GP	General-Purpose
GPIN	General-Purpose Input
GPIO	General-Purpose Input Output
GPMC	General-Purpose Memory Controller
HBM	Human Body Model
HDMI	High-Definition Multimedia Interface
HDQ	High-Speed Data Queue
HDTV	High-Definition Television
HS	High speed or high security
HIS	High-speed Synchronous Interface
HSUSB	High-Speed Universal Serial Bus
HWDBG	Hardware Debug
HYS	Hysteresis
I ² C	Inter-Integrated Circuit

I2S	Inter IC Sound
IC	Integrated Circuit
ICE	In-Circuit Emulator
IEEE	Institute of Electrical and Electronics Engineers
IO	Input Output
IR	Infrared
IrDA	Infrared Data Association
ISP	Image Sensing Product
ITU	International Telecommunications Union
IVA	Image and Video Accelerator
JEDEC	Joint Electron Device Engineering Council
JPEG	Joint Photographic Experts Group (Image format)
JTAG	Joint Test Action Group, IEEE 1149.1 standard
LCD	Liquid-Crystal Display
LDO	Low Dropout
LJF	Left-Justified Format
LP	Low Power
LVC MOS	Low-Voltage CMOS
LVDS	Low-Voltage Differential Signaling
McBSP	Multichannel Buffered Serial Port
McSPI	Multichannel Serial Port Interface
MIPI®	Mobile Industry Processor Interface (MIPI® is a registered trademark of Mobile Industry Processor (MIPI) Alliance.)
MIR	Medium Infrared
MMC	MultiMedia Card
MPU	Microprocessor Unit
MS-PRO	Memory Stick PRO
NA	Not Applicable
NAND	Not AND (Boolean Logic)
NOR	Not OR (Boolean Logic)
OMAP	Open Multimedia Applications Platform
PBGA	Plastic Ball Grid Array
PCB	Printed Circuit Board
PCM	Pulse Code Modulation
PDM	Pulse Density Modulation
PD	Pull Down
PHY	Physical Layer Controller
PLL	Phase-Locked Loop
PMIC	Power Management Integrated Circuit
POP	Package On Package
PU	Pull Up
QXGA	Quad eXtended Graphics Array
RAW	Raw (Image format)
RFBI	Remote Frame Buffer Interface
RGB	Red Green Blue (Image format)
RMS	Root Mean Square
RX	Receiver / Receive
SAP	TBD
SCL	Serial Clock: programmable serial clock used in the I ² C interface (can be called also SCLK).
SDA	Serial Data: serial data bus in the I ² C interface.

SDI	Serial Display Interface
SDIO	Secure Digital Input Output
SDMMC	Secure Digital MultiMedia Card
SDR	Single Data Rate
SDRAM	Synchronous Dynamic Random Access Memory
SDRC	SDRAM Controller
SDTI	System Debug Trace Interface
SIM	Subscriber Identity Module
SIR	Slow Infrared
SMPS	Switching-Mode Power Supply
SPI	Serial Port Interface
SRAM	Synchronous Random Access Memory
SSI	Synchronous Serial Interface
STN	Super Twist Nematic (LCD Panel)
SYNC	Synchronous
SYS	System
TAP	Test Access Point
TBD	To Be Defined
TDM	Time Division Multiplexing
TFT	Thin Film Transistor (LCD Panel)
TLL	Transceiver-less Link Logic
TX	Transmitter / Transmit
UART	Universal Asynchronous Receiver Transmitter
ULPI	UTMI Low Pin Interface
USB	Universal Serial Bus
UTMI	USB2.0 Transceiver Macrocell Interface
WKUP	Wake-Up
YUV	Luminance + 2 Chrominance Difference Signals (PAL Y, Cr, Cb) Color Encoding

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
