

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

- Single-Chip RF Transmitter for 315-MHz, 433-MHz, 868-MHz, and 915-MHz Industrial, Scientific, and Medical (ISM) Bands
- 2.2-V to 3.6-V Operation
- Low Power Consumption
- FSK/OOK Operation
- Integer-N Synthesizer With Fully Integrated Voltage Controlled Oscillator (VCO)
- On-Chip Reference Oscillator and Phase-Locked Loop (PLL)
- Power Amplifier With 8-dBm Typical Output Power
- Programmable Brownout Detector
- Integrated Data Bit Synchronizer and Baud Rate Selection
- Flexible 3-Wire Serial Interface
- Minimal Number of External Components Required
- 24-Pin Plastic Thin-Shrink Small Outline Package (TSSOP)
- Programmable XTAL Trimming
- Lock Detect Indicator
- Companion Transmitter to the TRF6903 Transceiver

PW PACKAGE
(TOP VIEW)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the gates.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

description

The TRF4903 single-chip solution is an integrated circuit intended for use as a low-cost multiband FSK or OOK transmitter to establish a frequency-programmable, half-duplex RF link. The multichannel transmitter is intended for digital (FSK, OOK) modulated applications in the North American and European 315-MHz, 433-MHz, 868-MHz, and 915-MHz ISM bands. The single-chip operates down to 2.2 V and is designed for low power consumption. The synthesizer has a typical channel spacing of better than 200 kHz and features a fully-integrated VCO. Only the PLL loop filter is external to the device.

Two fully-programmable operation modes, Mode0 and Mode1, allow extremely fast switching between two preprogrammed settings (for example, TX_frequency_0/TX_frequency_1; ...) without reprogramming the device.

ISM band standards

Europe has assigned an unlicensed frequency band of 868 MHz to 870 MHz. This band is specifically defined for short range devices with duty cycles from 0.1% to 100% in several subbands. The new European frequency band, due to the duty cycle assignment, allows a reliable RF link and makes many new applications possible.

The North American unlicensed ISM band covers 902 MHz to 928 MHz (center frequency of 915 MHz) and is suitable for short range RF links.

transmitter

The transmitter consists of an integrated VCO and tank circuit, a complete integer-N synthesizer, and a power amplifier. The dividers, prescaler, and reference oscillator require only the addition of an external crystal and a loop filter to provide a complete PLL with a typical frequency resolution of better than 200 kHz.

Since the typical RF output power is approximately 8 dBm, no additional external RF power amplifier is necessary in most applications.

Four attenuation setting for the power amplifier are offered. This feature allows the user to fine tune the amplifier for optimal output power.

baseband interface

The TRF4903 can easily be interfaced to a baseband processor such as the Texas Instruments MSP430 ultralow-power microcontroller (see Figure 1). The TRF4903 serial control registers are programmed by the MSP430 and the MSP430 performs baseband operations in the software.

A synchronized data clock, programmable for most common data rates, is provided by the TRF4903. During transmit, the data clock can be used to clock the transmit data from the microcontroller to the TRF4903 at predefined data rates.

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
CLOCK	24	I	Serial interface clock signal input
CP_GND	15		Charge pump ground
CP_OUT	14	O	Charge pump output
CP_VCC	13		Charge pump supply voltage
DATA	23	I	Serial interface data signal input
DET_LD_DCLK	16	O	Brownout detector (active high), PLL lock detect (active high), and data clock multiplexed output
DGND	18		Digital and XTAL oscillator ground
DVDD	17		Digital and XTAL oscillator power supply
GND	21		Substrate ground
MODE	2	I	Mode select input
PA_GND1	5		Power amplifier ground
PA_GND2	7		Power amplifier ground
PA_OUT	4	O	Power amplifier output
PA_VCC	6		Power amplifier supply voltage
STDBY	3	I	Standby input signal; active low
STROBE	22	I	Serial interface strobe signal
TX_DATA	1	I	Buffered TX data input
VCO_BYPASS	11	I	VCO bypass; connect to ground through a 100-pF capacitor
VCO_GND	9		VCO ground
VCO_TUNE	12	I	Tuning voltage for the integrated VCO
VCO_CORE_VCC	10		VCO core supply voltage
VCO_PRE_VCC	8		Divider and prescaler supply voltage
XTAL	19	I/O	Connection to an external crystal reference
XTAL_SW	20	I	Connection to external capacitor, which sets the frequency deviation of the transmitted signal

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Supply voltage range	–0.6 to 4.5 Vdc
Input voltage, logic signals	–0.6 to 4.5 Vdc
Storage temperature range, T _{stg}	–65°C to 150°C
ESD protection, human body model (HBM)	2 kV

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

recommended operating conditions

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Analog supply voltage		2.2		3.6	V

NOTE: TX_DATA is latched at the rising edge of DCLK.

Figure 3. Timing Data for DCLK and TX_DATA

If transmit capture mode is selected (by setting bit 15 in word E), the data transitions (high-to-low or low-to-high) on the TXDATA pin is timed to coincide with the falling edge of DCLK. Any microcontroller using the TRF6903 can then latch TXDATA on the rising edge of DCLK. For more details, see the *data clock* section.

detailed description

bit synchronizer and data clock

When enabled, the integrated bit synchronizer and data clock circuitry provide as an output at terminal 16, DET_LD_DCLK, a data clock based on a programmable bit rate. The bit rate is programmable via variables D1, D2, and D3 and is always relative to the master clock (XTAL) frequency, F_x . Table 1 shows common bit rates (kbps) vs selected crystal frequencies (MHz) and the respective settings of D1, D2, and D3.

The preprogrammed bit rate can be calculated based on the following equation:

$$\text{Bit rate (kbps)} = \frac{\text{crystal frequency (kHz)}}{D1 \times D2 \times D3} = \frac{F_x}{D1 \times D2 \times D3} = f_c \text{ (kHz)}$$

where:

- D1 = 1, 5, 6, or 8
- D2 = 1, 2, 4, 8, 16, 32, 64, or 128
- D3 = 15 or 16

The data clock circuit is designed to reset/clear internally with no user action required.

main divider

The main divider is composed of a 5-bit A-counter and a 9-bit B-counter and a prescaler. The A-counter controls the divider ratio of the prescaler, which divides the VCO signal by either 33 or 32. The prescaler divides by 33 until the A-counter reaches its terminal count and then divides by 32 until the B-counter reaches terminal count, whereupon both counters reset and the cycle repeats. The total divide-by-N operation is related to the 32/33 prescaler by:

$$N_{TOTAL} = 33 \times A + 32 \times (B - A)$$

where $0 \leq A \leq 31$ and $31 \leq B \leq 511$ or, $N_{TOTAL} = A + 32B$

Thus, the N-divider has a range of $992 \leq N_{TOTAL} \leq 16383$

detailed description (continued)

PLL

The phase-locked loop is the radio frequency synthesizer for the TRF4903. It is used to generate the transmit signal and as the local oscillator for the receive mixer. The signal (F_X) from a reference crystal oscillator (XO) is divided by an integer factor R down to F_R . The minimum frequency resolution, and thus, the minimum channel spacing, is F_R .

$$F_R = F_X \div R \text{ where } 1 \leq R \leq 256$$

The phase-locked loop is an integer-N design. The voltage-controlled oscillator (VCO) signal is divided by an integer factor N to get a frequency at the phase detector input.

$$F_{PD} = F_{VCO} \div N$$

The phase detector compares the divided VCO signal to the divided crystal frequency and implements an error signal from two charge pumps. The error signal corrects the VCO output to the desired frequency.

As is in any integer-N PLLs, the VCO output has spurs at integer multiples of the reference frequency (nF_R). In applications requiring contiguous frequency channels, the reference frequency is often chosen to be equal to the channel spacing, thus, channel spacing = $F_R = F_X \div R$. When enabled and when the PLL is locked, the DET_LD_DCLK terminal is high.

With the addition of an output divider for multiband operation, the actual output frequency, F_{out} , is given by:

$$F_{out} = \frac{F_{VCO}}{P} = \frac{F_X}{R} \times \frac{N}{P} = F_R \times \frac{N}{P} = \frac{A + 32B}{P} \times F_R$$

where $F_R = F_{PD}$ under locked conditions. The actual minimum channel spacing is:

$$\frac{F_R}{P} = \frac{F_X \div R}{P}$$

where P = 1, 2, 3 and is set by A<1:0>.

oscillator circuit and reference divider

The reference divider reduces the frequency of the external crystal (F_X) by an 8-bit programmable integer divisor, R, to an internal reference frequency (F_R) used for the phase-locked loop. The choice of internal reference frequency also has implications for lock time, maximum data rate, noise floor, and loop-filter design. The crystal frequency can be tuned using the F word to control internal trimming capacitors, which are placed in parallel with the crystal. These offset a small frequency error in the crystal. In an FSK application, an additional capacitor is placed in parallel (through terminal 19) with the external capacitor that is connected in series with the crystal, thus, changing the load capacitance as the transmit data switch (TX_DATA, terminal 1) is toggled. The change in load capacitance pulls the crystal off-frequency by the total frequency deviation.

Hence, the 2-FSK frequency, set by the level of TX_DATA and the external capacitor, can be represented as follows:

$$f_{out1} = \text{TX_DATA Low (XTAL switch closed)} \quad f_{out2} = \text{TX_DATA High (XTAL switch open)}$$

Note that the frequencies f_{out1} and f_{out2} are centered about the frequency $f_{center} = (f_{out1} + f_{out2})/2$. When transmitting FSK, f_{center} is considered to be the effective carrier frequency and any receiver local oscillator (LO) should be set to the same f_{center} frequency \pm the receiver's IF frequency (f_{IF}) for proper reception and demodulation.

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

oscillator circuit and reference divider (continued)

For the case of high-side injection, the receiver LO would be set to $f_{LO} = f_{center} + f_{IF}$. Using high-side injection, the received data would be inverted from the transmitted data applied at terminal 1, TX_DATA. Conversely, for low-side injection, the receiver LO would be set to $f_{LO} = f_{center} - f_{IF}$. Using low-side injection, the received data would be the same as the transmitted data.

Figure 4. TRF4903 PLL and Output Divider

phase detector and charge pumps

The phase detector is a phase-frequency design. The phase-frequency detector gain is given by:

$$K_P = I_{(CP)} / 2\pi$$

where, $I_{(CP)}$ is the peak charge pump current. The peak charge pump current is programmable with A<3:2> in three steps: 250 μ A, 500 μ A, and 1000 μ A.

loop filter

The loop filter must be carefully chosen for proper operation of the TRF4903. The loop filter is typically a second- or third-order passive design, and in FSK operation should have a bandwidth wide enough to allow the PLL to relock quickly as the external crystal frequency is pulled off-center during modulation. The loop filter should also be wider than the data modulation rate. These requirements should be balanced with making the loop narrow enough in consideration of the reference frequency. In OOK the VCO frequency is not changed during data modulation, so the filter bandwidth may be narrower than the modulation bandwidth. Filters can be calculated using standard formulas in reference literature. Some third-order filter examples are shown in Table 2.

loop filter (continued)

$$F(s) = \frac{1 + sC2R2}{s(C1 + C2 + sC1C2R2)} \times \frac{\frac{1}{C3R3}}{s + \frac{1}{C3R3}}$$

VCO

The voltage-controlled oscillator (VCO) produces an RF output signal with a frequency that is dependent upon the dc-tuning voltage at terminal 12. The tank circuit is passive and has integrated varactor diodes and inductors. The open-loop VCO gain is approximately 100 MHz/V.

A <1:0> is used to set the output divider ratio for operation within the 315-MHz, 433-MHz, 868-MHz, or 915-MHz bands.

When the $\overline{\text{STDBY}}$ terminal is high, the reference, PLL, VCO, and dividers are powered up. When $\overline{\text{STDBY}}$ is low, these blocks are powered down.

power amplifier

The power amplifier has three programmable attenuation states as determined by A<7:6> and B<7:6>: full power (0-dB attenuation), 10-dB attenuation, and 20-dB attenuation. This adjustment feature allows the user to fine-tune the device for optimal output power. The power amplifier can be enabled/disabled during transmit by bit B<3>, PAED. During ASK or OOK operation, the TX_DATA signal turns the output stage of the power amplifier on and off according to the transmit data incident at terminal 1.

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

power amplifier (continued)

Figure 6. Typical PA Output Impedance (S22) at Device Terminal PA_OUT

brownout detector

The brownout detector provides an output voltage to indicate a low supply voltage. This may be used to signal the need to change transmit power to conserve battery life, or for system power down. The brownout detector threshold is set with the B word. Four different thresholds are available.

serial control interface

The TRF4903 is controlled through a serial interface; there are five 24-bit control words (A, B, C, D, E) which set the device state. The A and B words are almost identical, and provide configuration settings for two modes, designated 0 and 1, which are commonly used to configure the transmit states. Two transmit states can then be rapidly selected using MODE (terminal 2). The C word sets the reference dividers, the power amplifier bias, and contains various reset bits. The E word contains the bit-rate select, data clock control bits, and the power amplifier bias control registers. The D word is used to trim the external crystal frequency and tune the demodulator.

The register address is the composite of bits 23, 22, 1, and 0 of the 24 bits written to the serial interface. For some words, certain bits of the address are don't cares and are noted as XX. This flexible addressing scheme allows compatibility with the TRF6901/TRF6903 and because of this flexibility, the data length of each register varies from 15 bits to 22 bits.

Normal (write) operation of the serial interface is to clock in 24 bits through the CLOCK and DATA terminals. DATA values are clocked into the 24-bit serial interface shift register on the rising edge of CLOCK. The 24-bit value is decoded and written into the appropriate data register on the rising edge of STROBE.

PRINCIPLES OF OPERATION

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

PRINCIPLES OF OPERATION

At power on/startup, all of the TRF4903 register contents are as per the default values.

Address 00XX (A-Word)

Word A is a 22-bit data register comprising five fields. The main A-divider coefficient (mode 0), A<21:17>, is the 5-bit divider ratio of the A counter when the MODE terminal is low. The main B-divider coefficient (mode 0), A<16:8>, is the 9-bit value of the B counter when the MODE terminal is low. A <21:17> and A <16:8> are unsigned binary values. PA0, A<7:6>, is the 2-bit PA attenuation setting when the MODE terminal is low. CP Acc., A<3:2>, sets the charge pump current. BND, A<1:0>, sets the output divider, which in turn determines the band of operation.

Terminal 2 (MODE) selects bits A<21:5> if low, or B<21:5> if high.

Main divider A<21:17>: 5-bit value for divider ratio of the A counter

Main divider A<16:8>: 9-bit value for divider ratio of the B counter

PA attenuation A<7:6>: 2 bits for setting the PA attenuation

A<7:6>	PA ATTENUATION
00	0 dB
01	10 dB
10	20 dB
11	Not defined

A<5>: 1-bit; set high

A<3:2>: 2 bits for setting the charge pump current

A<3:2>	CP CURRENT
00	0.5 mA
01	1 mA
10	0.25 mA
11	Not defined

A<1:0>: 2-bit value to set the output divider and thus select the band of operation.

A<1:0>	OUTPUT DIVIDER RATIO, P	BAND OF OPERATION
00	3	315 MHz
01	2	433 MHz
10	1	868 MHz or 915 MHz
11	1	868 MHz or 915 MHz

Bit A<4> is reserved and should be set to 0.

PRINCIPLES OF OPERATION

Address 01XX (B-Word)

Word B is a 22-bit data register comprising seven fields. The main A-divider coefficient (mode 1), B<21:17>, is the 5-bit divider ratio of the A counter when the MODE terminal is high. The main B-divider coefficient (mode 1), B<16:8>, is the 9-bit value of the B counter when the MODE terminal is high. B<21:17> and B<16:8> are unsigned binary values. PA1, B<7:6>, is the 2-bit PA attenuation setting when the MODE terminal is high. FSK/OOK, B<4>, sets the modulation scheme for TX. Bit B<3> enables/disables the power amplifier while in transmit mode. The detector threshold, B<2:1>, is the 2-bit setting for the threshold voltage of the brownout detector. Det. Enable, B<0>, is the brownout detector enable flag.

Terminal 21 (MODE) selects bits A<21:5> if low, or B<21:5> if high.

Main divider B<21:17>: 5-bit value for divider ratio of the A-counter

Main divider B<16:8>: 9-bit value for divider ratio of the B-counter

PA attenuation B<7:6>: 2 bits for setting the PA attenuation

B<7:6>	PA ATTENUATION
00	0 dB
01	10 dB
10	20 dB
11	Not defined

B<5>: 1-bit; set high

B<4> 1-bit modulation select

B<4>	TX MODULATION
0	OOK
1	FSK

B<3>: 1-bit PA enable/disable

B<3>	PA ENABLE/DISABLE
0	PA disabled
1	PA enabled

B<2:1>: 2-bit value to set the threshold voltage for the brownout detector

B<2:1>	THRESHOLD VOLTAGE
00	2.2 V
01	2.4 V
10	2.6 V
11	2.8 V

B<0>: 1 bit to enable brownout detector

B<0>	BROWNOUT DETECTOR
0	Off
1	On

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

PRINCIPLES OF OPERATION

Address 1000 (C-Word)

Word C is a 20-bit data register comprising four fields. The reference divider coefficient, $C\langle 21:14 \rangle$, is the 8-bit divider ratio of the reference divider. The allowable reference divider range is 2 ($C\langle 21:14 \rangle = 00000010$) through 255 ($C\langle 21:14 \rangle = 11111111$).

Reference divider $C\langle 21:14 \rangle$: 8-bit value for divider ratio of reference divider. $C\langle 21:14 \rangle$ is an unsigned binary value.

Bits $C\langle 13 \rangle$ through $C\langle 2 \rangle$ are reserved and should be set to 0.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

PRINCIPLES OF OPERATION

Address 1001 (E-Word)

Word E is a 20-bit data register comprising five fields. The bit rate or bit frequency, used by the transmit synchronous mode is controlled by the BRA, E<21:20>, BRB, E<19:17>, and BRC, E<16>, fields. These three fields control a sequence of dividers, D1 through D3, that divide the reference (crystal) frequency, F_X .

E<21:20>: 2 bits to set D1 divider setting

E<21:20>	D1
00	1
01	5
10	6
11	8

E<19:17>: 3 bits to set D2 divider setting

E<19:17>	D2
000	1
001	2
010	4
011	8
100	16
101	32
110	64
111	128

E<16>: 1 bit to set D3 divider setting

E<16>	D3
0	16
1	15

TXM, E<15>, sets the transmit capture mode. If TXM is low, the TX_DATA terminal controls the transmit function asynchronously. If TXM is high and the bit-rate clock enabled, the bit-rate clock, DCLK, is output at the DET_LD_DCLK terminal and the transmit data at the TX_DATA terminal is latched on the rising edge of DCLK.

E<12:11>: 2 bits to determine the function of terminal 16

E<12:11>	TERMINAL 16, DET_LD_DCLK, FUNCTION
00	PLL lock detect output (default)
01	Data clock output
10	Brownout detect output
11	Not used

Bits E<14>, E<13> and E<10> through E<2> are reserved and should be set to 0.

TRF4903 SINGLE-CHIP MULTIBAND RF TRANSMITTER

SWRS023B – MAY 2004 – REVISED MARCH 2005

PRINCIPLES OF OPERATION

Address 11X0 (D-Word)

Word D is a 21-bit data register comprising two fields. Bit D<20> controls the position of the XTAL switch during OOK operation. XTAL_Tune, D<18:16>, is used to fine tune the crystal frequency by using an internal capacitor bank. PFD reset, D<15>, selects the source of the PFD reset signal.

D<20>: 1-bit value to control the position of the XTAL switch during OOK operation, when B<4>=0.

D<20>	XTAL SWITCH DURING OOK OPERATION	TERMINAL 20
0	Unconnected (open)	High-Z
1	Connected (closed)	Shorted to ground externally

It is recommended that D<20> be set to 0 during OOK operation.

D<18:16>: 3-bit value to fine-tune the XTAL frequency by using an internal capacitor bank

D<18:16>	TYPICAL LOAD CAPACITANCE
000	13.23 pF
001	22.57 pF
010	17.9 pF
011	27.24 pF
100	15.56 pF
101	24.9 pF
110	20.23 pF
111	29.57 pF

D<15>: 1-bit value to select the reset signal for the PFD

D<15>	RESET SIGNAL
0	Derived from XTAL
1	Derived from prescaler

NOTE: The default setting for D<15> is 1.

Bits D<21>, D<19>, and D<12> through D<1> are reserved and should be set to 0.

operating modes

Controlled with terminal 3, $\overline{\text{STDBY}}$

$\overline{\text{STDBY}}$	OPERATING MODE
0	Power down of all blocks—programming mode
1	Operational mode and programming mode

Controlled with terminal 2, MODE

MODE	OPERATING MODE
0	Enable A-word
1	Enable B-word

operating modes (continued)

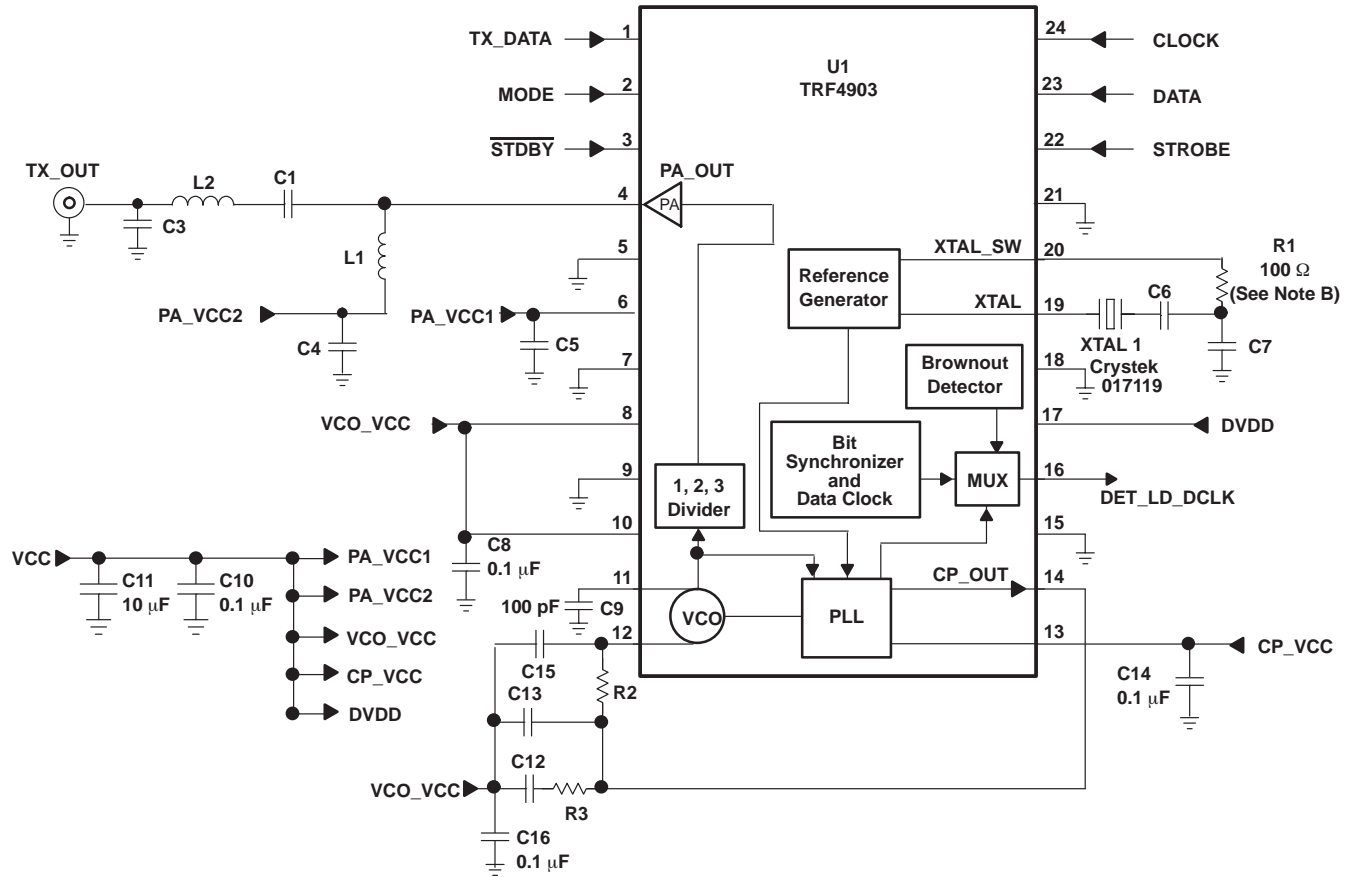

The transmit mode is controlled by the A<5>, B<5>, and B<3> fields and the MODE and $\overline{\text{STDBY}}$ terminals.

A<5>	B<5>	B<3>	MODE	$\overline{\text{STDBY}}$	OPERATING MODE
X	X	X	X	0	Off, programming mode; SPI enabled
1	X	0	0	1	Transmit mode 0, PA disabled; reference, PLL, VCO, and dividers enabled
1	X	1	0	1	Transmit mode 0, PA enabled; reference, PLL, VCO, and dividers enabled
X	1	0	1	1	Transmit mode 1, PA disabled; reference, PLL, VCO, and dividers enabled
X	1	1	1	1	Transmit mode 1, PA enabled; reference, PLL, VCO, and dividers enabled

TRF4903PWRG4	NRND	TSSOP	PW	24		TBD	Call TI	Call TI	-40 to 85		

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 -  C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 -  D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
 - E. Falls within JEDEC MO-153

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
